New Fresh Fruit Standardization Law.

Enthusiastic, unanimous commendation of the new fresh fruit standardization law. You can't find a knocker among shippers or foresighted growers of pears, peaches, grapes, berries, apricots, cherries, plums, or cantaloupes.

[Written for Pacific Rural Press.]

THE law, which went into effect Aug. 9, last year, was thoroughly tried out last fall on grapes and some of the pears. Its effect so far this season, is good for manufacturers of farmers' automobiles and other farm conveniences. A large part of our present

season's exceptional prices, for the extra heavy early shipments, is due to the law. These early shipments are of such quality, uniformity, and maturity where the law is properly enforced, that the first sight and taste whets Eastern appetites for what we shall send them later. This season's fancy dependable "California fruit" will be remembered with gastronomic anticipation next season.

"How do you like the law?"

"Throwing out lots of our fruit, but it's good for us. The law has been accepted most favorably by growers and shippers alike, and is certainly a protection against the unscrupulous packer. It is probably the best defense we have of our reputation as packers and shippers of good fruit. We notice also that there are fewer rejections and requests for allowances by Eastern buyers, due in a great measure to the law."—J. L. Nagle, extensive grower, and manager of the growers' co-operative Calif. Fruit Exchange.

"So far as the standardization law has been observed and enforced, its effect has been most beneficial for growers. The necessary steps to enforce the law have not been taken in all localities; in these places, we still have to contend with the short-sighted and dishonest policy of some packers, who not only refuse to refrain from the shipment of green and immature fruit, but continue to "top" their packages, placing fine specimens in the top layer and much smaller fruit in the bottom and middle layers. The only way to enforce the law governing such matters is to have duly qualified and impartial inspectors. By far the greater percentage of fruit is honestly packed, but it should all be so; and all growers who are unwilling to obey the law should be compelled to do so.

"The effect of the law is more plainly seen in the grape shipments than elsewhere. It would be difficult to find a grape grower who will not freely admit that same has been most beneficial to him. Sweet California grapes, free from mildew, have the highest standing in Eastern markets. Sour, unpalatable grapes are unhealthful, disgusting and absolutely valueless. Early shipments of such stock in previous seasons, while frequently selling for high prices, have completely ruined the market, so that later shipments of really fine fruit have gone begging because the consumers have not had time to forget the swindle that had been previously perpetrated upon them.

"Grapes shipped last season, after the law went into effect, were sweet, and met favorable reception by the trade, readily selling at satisfactory prices. There was no break in the market as in previous years, and it is our belief that we can sell fifty per cent more grapes in the future than in the past, and at fair prices, as the immediate result of the enactment of this law. Here, then, is a very tangible result of standardization; and the benefit accrues to grower and consumer alike.

"Close grading, the rejection of all fruit not up to the standard of quality, might cut down the shipment of some varieties; but would result in higher prices and bring a better return per acre. It would compel the careless producer of trash to mend his ways, or be forced out of business, either result being of great benefit to the industry."—F. B. McKevitt, extensive grower, and president Cal. Fruit Distributors.

"I'm getting more and more enthusiastic about it. Practical and experienced growers and shippers all during discussion of the law, contended for honest pack based on uniform size, quality, and maturity throughout each package. Placer county was first to establish standards, similar to those now in the law; since 1911, the rules have been very generally observed. Results have been markedly favorable."—H. E. Butler, extensive grower and author of first draft of the law.

"El Dorado county has maintained the highest fruit standardization

law for about six years, of any county in the State," writes horticultural commissioner J. E. Hassler. "As a consequence, our fruits have gained an enviable reputation wherever sold, with corresponding good prices; and it is our intention still further to grade and improve our fruit pack."

"The law is one of the very few good laws passed by the last legislature. It raises the standard of California fruit and protects the honest grower against the fellow who would ship buckeyes and label them Winter Nelis pears."—D. F. Norton, Nevada county horticultural commissioner.

"This new law is certainly of great benefit to the industry. I think it should be enlarged to include all farm products handled in this State."—F. W. Waite, Imperial county horticultural commissioner.

Similar sentiments are multiplied by all from whom we have expressions.

The Fundamental Features of the Law are that before interstate or foreign shipment of the fruits named in our sub-heading, in packed boxes, crates, etc., they must be:

- (1) Practically free from insects and fungus diseases;
- (2) of practically uniform size, quality, and maturity;
- (3) grapes must contain 17 per cent sugar (16 per cent for Emperors);
- (4) on the outside of each container must be legibly stamped the name and location of grower and packer, the number, net weight, or "pack" of the contents, and the variety name;
- (5) wilful violation is punishable by fine or imprisonment;
- (6) enforcement is in the hands of inspectors, appointed by county horticultural commissioners; or in their absence, by county

supervisors upon petition by 25 resident fruit growers.

Growers' Co-operation Necessary.—Unanimous approval and co-operations of growers, packers, and shippers is needed; for inspection of every package is financially impossible. This year, as emphasized by F. C. Brosius, deputy county horticultural commissioner of Sacramento county, and C. K. Turner, Placer county horticultural commissioner, the great need is to show growers the advantages of universal standardization, and to show them that everybody's fruit is treated alike (the latter can't be done under the present law). To antagonize them by too strict enforcement would defeat the purpose of the law. The aim of inspectors is to get the fruit to market in an "eatable condition" with the least possible friction at this end.

Law Tried Out on Grapes.—With grapes last season, hydrometer tests of sugar content had to be taken in addition to the other inspection. San Joaquin county horticultural commissioner Wm. Garden worked up senti-

THE WEEK.

WHY should we worry? Those of us who have stock in the big overlands will get a bigger dividend next week than we ever received before. In spite of the irregularities in the season, Eastern fruit shipments are about twice as large as last year, and great prices have been gained. The trade promises to be large and profitable all through and buyers for canning and shipment seem to have lost their pocket-buttons. There is one very good thing about these fruit canners and shippers. They will have the stuff to do business with, and if the grower will not play their way they will play his way. Take, for instance, that which comes from Visalia: "Every grower has disposed of his entire crop at prices that have never before been realized. The organization of the peach growers' association and the canning peach growers' association brought good prices to the growers and left the packers without their full crop. The packers then went into the field and offered big money and eventually were successful in securing the balance of the crop sufficient to operate the canneries in the county and ship away to other concerns."

But the growers should remember that they must stay in the game; if they are misled by this season's prices they will be playing the buyers' way again before long. Do not jump off the bridge which carries you over. But peaches are not doing better than other fruits. Shipping grapes have been selling 50 per cent higher than last year. Pears and other available fruits may be expected also to make good records. Meat prices are climbing, and it looks as though not only the cow, but all the rest of the flesh-formers would jump over the moon. Blessed is the farmer who has something to sell. Even the hemp growers of San Joaquin have secured such prices that it is claimed that no other island crop has yielded so much money. Uncle Sam may find it an expensive job to hang all the murderous bandits he may catch.

WARS AND PRICES.

ALTHOUGH we are rather inclined to hold with those who believe that, on the whole, war is not good for anybody, it is clear enough that it lifts prices, which may not be good for everybody. There is seldom found anything which is good for everybody, and the wonder is, how the hindmost manages to escape the devil—but that is philosophy. The fact is interesting, nevertheless, and it has a lesson for our people who have capital and idle lands. A large meat-dealer told the Oakland Tribune this:

"War shipments are responsible for the shortage of beef. South America is sending great shiploads of beef to Europe that formerly came to this country. Australian meats are no longer being shipped here in any quantity. American wholesalers are sending great quantities to the fighting men of Europe, with the result that meat is getting to be a scarce article. Meat prices are considerably higher than they were at the corresponding period of 1915.

The greatest increase is being recorded in lamb. This is increasing in price a cent or more a pound every week or so. Beef is also increasing in price. Prices will continue to increase so long as the war lasts, as more and more meat is being shipped to Europe."

Some of them even say that beefsteak will retail at a dollar a pound before the turn comes. That may be so, for munition makers, army contractors and ship owners are coining money out of the war, both in this country and in Europe, and they must get rid of their surplus some way, but there will not be much steak eaten at the price of speckled brook trout. The significant lesson of the general fact is, however, that prices will go up and stay up for some time; perhaps, so far as we can see, they will always stay much higher than they have been. With all peaceful countries selling everything that can walk for meat, and with all warring countries killing all the animals they have, or can buy, for their armies, there is going to be an awful shortage of meat-making machinery. It is obvious that a meat supply cannot come back like a supply of potatoes. It takes two or three years to harvest any beef, even if you have the growing outfit; and when you are tempted by price, or forced by the war-office, to destroy the outfit, when can you get back? This will be the question, not only in this country, but in all competing countries in the beef supply, for they all will be drawn down to very low recuperating level from which to advance. And while such slow advance is being achieved there will be free field for all meats from animals which reproduce more rapidly. Therefore, all the chances in meat production, which we have had reason for years back to consider very promising, become immeasurably greater through the reducing experience which the world is now going through. Therefore, also, money and land now wisely put to meat-making has exceptional outlook for profitability.

RESTORATION OF BREEDING STOCK.

WE HAVE often mentioned the likelihood that America will be called upon to replace the fine breeding animals which have been lost in the belligerent countries; giving back to North Europe good specimens of breeds which were native to those scenes of desolation. It is sadly interesting to think of the American names and herd books which will figure in the rehabilitation of the world-famed breeding farms of North Germany, Belgium and North France. Probably much which may survive the war in those countries will have lost its identity. We deeply enjoyed converse with those people just before the war and were warmly welcomed to their homes, their stables and show rings, and could but admire their spirit and devotion to nobility in live stock. Now, probably many of the buildings are destroyed, the animals and their owners war-killed, and the fields desolate. It will take a whole generation of mankind to restore what two years of war has blotted out. We do not hear much about it, for the people patriotically cover their wounds, and yet we find a few very suggestive lines in the official economic weekly of North-west Germany, which, in reviewing the cattle-breeding situation, says this:

"Cattle, pigs and horses fetch fabulous prices, if obtainable at all, and inferior cattle are being introduced in many places. The wholesale supply of cattle to municipalities, now that private slaughtering is forbidden, constitutes a grave danger, because the number of breeding animals is greatly diminished. If this condition continues, there soon will be no more cows in calf, the consequences of which will be fatal to milk, butter, meat and fat supplies. Cattle, however, are generally healthy, although complaints of the great mortality of foals are rife. The lack of natural manure is very evident and the grain crop is only promising well where artificial manures are available. The lack of nitrates is sadly discernible. Vermin have created immense havoc to turnips, oats, summer wheat and fruit trees. Many fields had to be plowed over again. Labor is extremely scarce and only prisoners of war are available for farm work. If they are not supplied, which happens frequently, then farm work can only be done in part and under the greatest difficulties."

And this is about a district which we saw in the pink of breeders' prosperity about two years ago. It is sad beyond words.

LET THE WOMEN TAKE THE WORLD.

BUT one must have some relief from such a picture. The hope of the world is the women. Men have made such a wreck of homes and humanity that they ought to be dropped over the side of the whirling planet. Shall a few be saved? Perhaps so: just a few for policemen and preachers, for women seem to have a natural admiration for man thus functioning, but chuck the rest. We are quite willing to jump overboard, for we are ashamed of our murdering sex! But we speak as a man, forgetting that the Creator has implanted the force of gravitation to hold men to their disgraceful jobs. What then? Regeneration. And is regeneration possible? Yes; women can do it. It is cabled from the Hague, June 24, that the Zeitschrift. Fuer Frauenstimrecht, the German woman suffrage organ, has sent the following greeting to the women of France:

"We feel, think and suffer like you, and swear that after this catastrophic war the women of all nations shall work unitedly to prevent forever its recurrence."

This is really the way out; but remember, sisters, no more admiring glances at Mars; no more drooping lids for lieutenants—nothing left for you but frank, round-eyed worship for policemen, whose duty will be to world-jail all your old heroes! Can you do it? We shall see.

THE ETERNAL PETTICOAT QUESTION.

WHENEVER we think of something really great for women, the eternal petticoat question intrudes, for the same carrier which brings news of the everlasting peaceful purpose of the European women mocks us with a triviality from New York, stating that the common council of the town of New Providence, New Jersey, has passed resolutions requiring all women to wear skirts on the streets. The edict is aimed at a colony of rural dwellers, who claim that they have a right to wear "belted bloomers, soft shirts and sandals," the last at the lower ends of bare limbs, we presume. We cannot express any conviction as to the beauty of this outfit, having never seen it in operation, but the colony women who do wear it seem to have convictions, for, when arrested, one of them said: "We wear these costumes because they give us greater freedom in our work. They are not one-tenth as immodest as the suggestive costumes worn by the girls in New York. We are merely living close to nature and enjoying life."

As we are not an efficiency-expert we cannot figure out the relative percentages of immodesty which the costumes, described and hinted at, involve, but, roughly guessed at, it might appear that with the belted bloomers above, and, working downward as the descriptive artist seems to be doing, the soft shirt next, and the sandals below, it might be possible to produce all the suggestiveness which the New York girls are charged with. All of which ought to demonstrate that the New Providence colony women have a right to wear what they find good for their work, and the town council ought to keep out of the wardrobe.

THE RIGHT KIND OF A STOCK SHOW.

ONE of our associates brings to this issue an outline of a meeting of stock men held this week in San Francisco for the purpose of discussing the feasibility of holding a stock show this fall in San Francisco. Such an enterprise appeals to us as a very important incident in the general movement for greater live stock interests in California, which all friends of State advancement are doing what they can to promote. We have a very clear conviction that such a thing ought to be done, and that it ought to be done in a way to be acceptable and influential to people who like to have great thoughts for California, and to people also who are masters of ways and means to make great thoughts come through to realization. We are sure that A. W. Foster and others spoke truly, at the meeting to which we refer, that an ordinarily good rural stock show, which might be very influential in its district, would not cause a ripple in the deeper waters of San Francisco's customary action and interest. To do the stock interest and the State any good the show must be

great in the breadth and quality of its exhibits, great in its spirit, its environment and its social relations. In a word, it must be metropolitan in methods and motives. We believe that an event of such scope and requirements must be financed in the city. There are plenty of patriotic people in the city who would make liberal subscriptions or guaranties to carry a stock show to distinguished success if they had confidence that the trustees and executives who are chosen to accomplish it, know what great city events are, how to get them, and how to popularize them. Therefore, the first thing to do to get a great live stock show is to get a bunch of the right kind of men—creative, capable, compelling men, whom the city knows, follows and obeys in doing city-like things. The financing of such a great patriotic event is, in fact, only the city's proper share in it. It is to entertain, instruct and prosper the city by the drawing of great industrial lines of State development, which always must converge in the metropolis and invite the city's capital to profitable use. To do this it must cost enough to make the city feel that something is getting into its pocket and grab at it. It is the country's share to put on the exhibits and to spend its time and money to make those exhibits world-beaters in their way. To do this the breeders must buy stock, feed stock, massage stock and outfit an army of attendants, and have a try at dazzling premiums. In a word, the exhibitors must put on the show, and the city patrons must provide it everything needed to make it great, notable, popular and fashionable. We believe a really great thing can be done in this way if the right men will go to work at it. If it is undertaken in a small way the city will either never know of it, or laugh at it in a small individual way. Make the thing a thoroughbred or knock it in the head. We have had our say; if you think differently, break out with it!

Replanting Root-Knots.

To the Editor: Our peach trees, planted a year ago last winter, grew nicely last summer, with the exception of some which showed foliage reddish green this summer. By digging we find large knots on the roots and on the body of trees below the graft. The trees below the graft grow so much larger than they do above the graft. Will it do to put out new trees in the same places where these are taken out? Is there any remedy for trees infected this way?—L. W., Saugus.

This is a typical case of root knotting of young trees in which there is nothing to do but to dig them out. Where a knot has got such start of a young tree it is better to begin over. Dig them out now and leave the holes open to bake in the sun the rest of the season. Next winter dig the holes out larger and plant the new trees in the same places, to make your orchard lines right, but fill in around the trees with new soil.

Summer-Grazing Hogs in Old Orchard.

To the Editor: What would you advise me to plant in an orchard at this time of year for hog grazing? I have plenty of water available and figure on sowing as soon as each fruit crop is harvested. Would a combination of barley and vetch and barley and black eyes be first-class combinations? Would you consider raising and pasturing various crops of the legume family beneficial to an old orchard where the natural vegetation is practically a thing of the past?—W. D., Acampo.

Supposing you have some of the deep, well-drained loam which is abundant in your section, you can probably put on water rather freely without danger to the trees. If so the Black Eye or some other cow pea and barley ought to make you a good lot of green stuff for feeding. Cow peas are usually better summer growers than the vetches, which work well in a winter combination. We do not like pigs in an orchard which we care anything for, but some people do, and you can take your choice of these likings, but do not crowd in too many hogs and watch that they do not start in barking the trees. Surely growing green stuff and manuring an old orchard is good for it. Of course the hogs should be kept off when the ground is wet from irrigation.

Rape, Corn and Taffy.

To the Editor: What about rape? Can I drill it in the corn as they do in the East? You save us lots of loss and time in experimenting, by your advice. The Pacific Rural Press beats them all for reliability.—D. B. S., Santa Cruz.

Rape usually makes a measly summer growth in California, though it might do better with you right on the coast. The chances are, however, that drilling it in the corn would be more apt to spoil the corn, by interfering with proper summer cultivation than to get you anything worth while.

Twig Failure by "Brown Rot."

To the Editor: I send a few dead twigs of apricot trees. They are affected by some disease causing gum to exude. The twig then dies. The trees otherwise, for the present, do not seem to be infected.—J. E., Los Altos.

The gumming and death of the twigs is probably due to the work of the brown rot fungus which not only attacks the maturing fruit, but when conditions favor it, invades the tissues of the shoots and twigs, its work showing results the following season like those you send. The work of this fungus depends largely on the moisture conditions of the air; and dark days with damp air prevailing when the growth is starting, as was the case in February of this year, is very likely to bring out twig injury in vastly greater amount than in our normal years. The treatment would be lime-sulphur spraying after the leaves fall, followed by another lime-sulphur spraying just before the buds open for the new growth.

Crops for Alkali Sod Land.

To the Editor: What is a good crop to plant on Bermuda and salt grass sod land?—A. G. McC., Selma.

You probably have this kind of sod because these grasses will stand some alkali and unless you take steps to remove or keep down the alkali you will not get much else; because, though the salt grass can be cultivated out when other plants will take hold, Bermuda grass likes the soil all the better without the alkali and the more you work the land in ordinary ways the more Bermuda you will get. If the land is not too alkaline to carry a stand of alfalfa that plant will put up the best fight on the Bermuda we know of. For a cultivated crop, stock beets will stand most alkali and if winter grown will have the advantage of having the alkali down and the Bermuda inactive. You might also get a certain amount of winter-grown grain hay. There is little chance for summer crops: the Bermuda will be too busy.

On Ragged Edge of Alkali.

To the Editor: We have a seven-year prune orchard. Some places have more or less alkali, though not greatly perceptible amount. In the worst alkali places the foliage of the trees has turned yellow and they also have small dead branches such as may be seen through the whole orchard. It has not been irrigated for three years, though the water is within three or four feet of the top of the ground. Is this water too close to the surface, forcing up the alkali; and could we, by irrigating, force it down or wash it out, to a certain extent? The prunes are dropping heavily on these alkali places during these warm days.—C. M., Visalia.

Theoretically you could wash some alkali out of the surface soil by using plenty of sweet water on top—providing two things: first, that the ground water has a free out-flow at the present level so that adding more water would not raise it; second, that you could mulch, or otherwise treat the surface so that evaporation will be less than it has been hitherto. If you cannot be sure of these conditions, irrigation will perhaps cause the trees to die faster than they are now dying and will give you an alkali pond or an alkali flat—depending upon whether the water you add can get away below the surface or not.

Theoretically, again, if the area where the ground water is so near the surface is definite and adjacent land has ground water considerably lower, you can ditch through the rim of the basin which is holding the water up and draw it down to a

lower level and then irrigating with sweet water would be more likely to carry away alkali, if you reduced evaporation to a minimum by extra good surface cultivation between irrigations. If the ground water is high all around you there is no hope of working this way.

Theoretically, again, if you find by digging or boring a well that you have a gravel streak below, it is possible that such holes will draw down your present ground water and then irrigation might help to wash out some alkali and help the trees.

Practically, if you conclude that these subterranean researches would cost more than the prune trees are worth, we have to advise you that they will make a little better firewood now than if you leave them to be killed by alkali. The land would probably grow good date palms and possibly rather poor pears.

To Blast or Not to Blast.

To the Editor: We have a sandy loam soil about two and a half feet in depth, then comes gravel, that is a little hard to dig in. Would it be advisable to blast for trees in this soil?—L. W., Saugus.

Try an experiment to see how your gravel subsoil acts. Dig a hole in it, (after getting through the top soil,) deep enough to hold a pail of water and see how the gravel behaves towards it. If the water goes down into the gravel pretty soon, fill it up again and again and see if you can make it hold water. If not, you have no need to blast, the soil is probably too leaky already. If it does hold water after two or three fillings, it is probably somewhat cemented and a little shattering may help it. But do not decide too quickly; you are in a region of light rainfall and trees are apt to suffer from too much opening below, unless you are irrigating, and then you may need freer drainage than you do for rainfall. But do not shoot too soon. Sit down and study the Mexican situation. It is much like soil blasting in a dry country.

Bean Plants Going Singly.

To the Editor: My plants of pole beans are often dying one at a time in a hill at blooming time and thereafter. The root system of the dead vine parts from the ground easily. Bunch beans similarly located have the same leaf affliction. What is the cause and remedy?—G. M. S., Colusa.

The bean plants show some thrips' injury, but not enough to cause collapse, and this too is probably general through the patch. Going off singly as you describe and the loss of root-hold, indicate a root failure probably due to fungus invasion. This collapse is caused by the fusarium fungus with many plants including legumes. The actual detection of this fungus is not sure with dried specimens and is difficult under all conditions. There is no treatment sure to reach this trouble in the root. Removing and burning failing plants, as soon as they are seen, will make a garden patch look better and may do some good to other plants. The most rational thing to do for next year would be to rotate crops, bringing your beans on ground not recently occupied by their kind.

Standard Prune Pollenization.

To the Editor: Is the Burbank Standard prune a self-pollenizer or not; and, if not, what will it pollenize well with?—B. P., Grass Valley.

From what we understand to be its ancestry and from the general reports of its free bearing, we apprehend its self-pollination is all right. Has any grower had trouble with it?

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., June 27, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	24	39.25	46.02	68	44
Red Bluff	0	20.21	25.02	90	56
Sacramento	0	18.28	20.09	90	54
San Francisco	0	27.12	22.27	74	50
San Jose	0	16.31	16.79	88	44
Fresno	0	11.72	9.68	92	56
Independence	0	10.34	9.53	92	—
San Luis Obispo	0	26.89	20.51	88	42
Los Angeles	0	19.92	15.64	76	54
San Diego	0	12.55	10.01	68	56

New Fresh Fruit Standardization Law.

[Continued from page 1.]

ment among growers before picking time, by holding meetings all over the district, at which co-operation was promised. In this way, it was hoped to relieve the inspectors and avoid having a large number of them. That this failed to work so well as in Fresno Co. where horticultural commissioner Fred P. Roullard had a larger number of inspectors and where packing was done in larger houses than in San Joaquin county, is emphasized by Mr. McKevitt. Mr. Roullard had seven local inspectors, and a chief inspector whose principal duty was to standardize the work of the others. Each of the local men was responsible for six to twelve packing houses, and they inspected about 3000 carloads last fall at a cost of a trifle over \$1 per carload. To get uniform inspection, weekly meetings of the inspectors were held during August.

"Two points were forcibly brought out," reports Mr. Roullard. "(1) Heretofore grapes have been shipped too green to be palatable when put on sale in the East. The result was lower prices and condemnation of California grapes. (2) It is also evident that in the past, grapes badly mildewed have been freely shipped. Last season, many growers could not ship a large percentage of their crops on account of mildew, and the result has been far more efficient sulphuring this season." Mildewed berries were excluded from shipment as nearly as possible, but stem mildew was permitted.

P. H. McGarry of Clovis examined California Malagas and Tokays during Sept. and Oct., 1915, at Ogden, Denver, Kansas City, Chicago, Detroit, Buffalo, Boston, N. Y., Philadelphia, Pittsburgh, Cleveland, Minneapolis, St. Paul, Seattle, and Portland. He reported to Mr. Roullard, "I regret that I was unable to find mildew on the berry; but saw much stem mildew. . . . If mildewed grapes are not edible when packed, they can scarcely improve on the continental journey. Stem mildew has invariably extended to the grapes, giving them a musty, moldy flavor and often causing them to decay." Grapes of early varieties testing 17 per cent were going forward from Imperial Valley in mid-June.

Big Job with Cantaloupes.—The twenty cantaloupe inspectors of Imperial county have handled as much as 218 cars in one day. The law provides the number of melons to be put into each sized crate, and that they shall be of uniform size and maturity. Horticultural commissioner F. W. Waite gained the co-operation of the shippers so that their inspectors were appointed county inspectors, besides two at large. The daily government reports from 20 markets indicate good prices and "Quality Good," largely due, according to Mr. Waite, to the melons being picked "on fullslip" (mature). In view of disastrous former seasons, the present high markets are remarkable, since 2078 cars had been shipped this season up to June 17, 1916, while only 1452 cars had been shipped to the same date last year.

Drastic Enforcement Avoided.—Not much fruit has been condemned in the State, and very few arrests made. Final inspection at shipping sheds is used principally to check up the results of earlier inspections and instruction at the ranch packing

sheds, where most of California deciduous fruit is packed. Where fruit has been turned down for eastern shipment, it has usually been sold in California markets, to which the law does not apply. But Mr. Waite destroyed seven crates of green cantaloupes May 7; and many crates have had to be condemned in the fields.

This season, Sacramento county pears sized up two weeks early, but not enough sugar was elaborated on account of cool weather. This was discovered in the early shipments, and further shipments were forbidden until June 24. Such green pears would have to be stored in the east and would shrivel, then come into competition with later picked fruit.

Last fall J. B. Wright, Newcastle inspector, rejected 300 or 400 boxes of pears which had been shipped there for consolidation with other fruits into a car lot. Attempts failed to sell the pears locally and they were finally shipped back to their starting point at considerable loss.

In Fresno county Mr. Roullard last fall ordered a grower to repack 294 crates of mildewed grapes, cutting out mildewed berries. The grower shipped them without repacking, and was convicted and fined by the lower court. Two carloads shipped from a neighboring county into Mr. Roullard's territory to be packed were so rankly mildewed that they were condemned outright.

D. F. Norton, Nevada county horticultural commissioner, had a case where unripe, diseased, and insect-infested fruit was persistently shipped. His appeal to the attorney-general brought the advice to have the shipper arrested as the law provides; but this is much to be avoided wherever possible.

Of the 180,000 crates of strawberries shipped from Sacramento county this spring, 6800 were condemned and sold locally. Many of these were simply too ripe to ship far.

Standardization Tried Before.—Placer county, which took the lead in putting the new law in force, ships more deciduous fruit out of the State than any other. Shippers here have for several years enforced standardization similar to that now required by law; but not all of the 12 or 15 companies operating there were proof against temptation. Thus it often happened that when the inspector would turn down fruit at one house, it would be accepted at another in order to get the grower's account. Mr. Wright inspected two years thus, at Newcastle, where there are about a dozen competing shippers. He says that the troubles of enforcing standardization were multiplied before the law went into effect. We have the secret also from other shippers and inspectors, that small fruits would habitually be rolled pell mell into bottom layers of packages where the top layers were packed carefully with beautiful uniform big fruit. It is also whispered that not uncommonly were buckeyes, oak balls, green apples, green peaches, and even pebbles hidden away in the under layers to damn

the sale of California fruit.

How Inspectors Work.—Now the inspectors go to the bottom of an occasional crate or box in every load of fruit that comes to any shipping house, unless the grower's pack has proved reliable. They still uncover fraud; but when fruit is condemned, a grower cannot get by with it at any other house.

A grower brought his first load of Burbank plums to a Newcastle shipping house, packed honestly, but absolutely no color. He promised not to pick any more until they had a considerable blush near the point, as Inspector John Soto instructed him.

In another load, three boxes of peaches were found marked "85" when they should have been "90" and were re-marked before passed. On a previous day, he had stirred up a man-sized row by requiring the repacking of a lot which he showed could be packed half a dozen more peaches per box. Mr. Wright had also found 60 boxes marked "85," when they should be "90" which averages 5 cents less per box.

"Never a day passes but what we reject fruit at 1-3 to 1/2 of the houses in town," said Mr. Wright. "This is mostly for lack of uniform size. We find fruit mismarked both as to size, variety, and sometimes name of grower. These we can correct by re-marking at the shed and cautioning against future offenses. Overmature or green fruit sometimes has to go back to the ranch or to local markets, because the packages usually lack uniform maturity."

Inspection is helped by each house having its own receiver, who inspects crates or boxes of every load and calls the inspector's attention particularly to any faults. A Hindu grower in the country was found by one of the shippers, almost stripping his plum trees at one picking. The inspector was notified to watch particularly for that fruit, which was likely to lack uniform size and maturity.

Country Inspection.—The most important part of all inspectors' work is at the ranch packing houses; for prevention of wrong packing or marking is far better than later rejection. Placer county's eight inspectors take care of their shipping sheds, and spend as much time as possible on the ranches. Mr. Turner acts as a supervisor and unifier of all of them.

In Sacramento county, just now, a man on horseback rides the American River and two men on motorcycles watch the packing on the Sacramento.

When the Sacramento inspectors find refractory packers, they telephone to horticultural commissioner H. G. Kercheval, and either he or Mr. Brosius interviews the grower and his packer, and then watches for his fruit at the next morning's regular inspection at Sacramento city docks. One or the other of these gentlemen always spends the day in the fruit districts. They have let some immature fruit go through this season, because packers were uninformed until detected.

Problems and suggestions for improvement of the law will be treated in another article.

Only three rejections of berries under the fruit standardization law are reported from Sonoma county.

Productive Value of Oranges.

[Written for Pacific Rural Press by Prof. R. S. Vaile, Citrus Experiment Station, University of California.]

Attention is constantly called by real estate agents, promotion companies, and enthusiastic growers, to the profits which may be realized from orange groves. On the other hand, there are a large number of growers who claim that the industry has passed its prime, or that the middle-man, or the marketing system in general is taking the profit. The writer has been gathering figures that might serve as a basis for an impartial analysis of the situation, in showing where between the extremes, the economic situation of the industry really stands.

AVERAGE ORANGE COSTS, VALUES AND PROFITS.

	Per acre yield	Yield above cost	Net value of crop	Interest on \$1000 per acre valuation.	Per acre value on which 6% be paid
State 5 yr average, 1910-11, to 14-15	127	17	\$21.25	\$2.125	\$355.00
4 year average (omitting freeze year)	145	35	43.75	4.375	725.00
1914-1915	142	32	40.00	4.00	665.00
High yielding section, 1914-15	196	86	107.50	10.75	1800.00
5 year average 1906-7, to 1910-11, 26000 acres	157	47	58.75	5.875	980.00

The factors which must be considered in determining the net value of any crop are (1) the per-acre production, (2) the per-acre cost of production, (3) the net value to the grove, for a unit of production.

(1) Calculations based on acreage figures gathered by the State Commissioner of Horticulture, and shipments actually made by the railroads, show that the average yield per acre of all oranges of bearing age, throughout California for the five years, 1910-11 to 1914-15 inclusive, was approximately 127 packed boxes. The highest seasonal yield during that period was 158 packed boxes in 1913-14. The 1914-15 crop averaged 142 packed boxes per acre. The highest yield for a district of any considerable size (foothill section of Los Angeles country from Claremont to Duarte) was 196 packed boxes per acre. The Citrus Protective League gives the average on 26,000 acres from 1906-7 to 1910-11 inclusive, as 157 packed boxes.

(2) The Citrus Protective League in figuring the cost of production for the 1910-11 crop, found that \$136.30 per acre was the average expenditure on orange groves without including the harvesting, packing, or marketing charges. This allows nothing for interest on the investment. The writer's investigations indicate that this figure is, if anything, too low, rather than too

high. This figure is an average one, the best producing groves cost somewhat more per acre in general, while many of the low producers cost somewhat less.

(3) Such figures as are available indicate that the average price, 1910-15, per packed box f. o. b. California, for all oranges has been not to exceed \$1.70. From this must be subtracted \$.0771 as cost of picking, \$.0287 for hauling, \$.3246 for packing, \$.07 for selling, or a total of \$.5004. This leaves a net value to the grove of approximately \$1.20 per packed box.

Costs Paid by 110 Boxes.—Assuming that the figures noted above are accurate for the per-acre cost of cultural operations (which costs remain fixed within fairly narrow limits, no matter what the yield), and assuming that the average selling price for the past five years gives a just indication of future prices, at least 110 packed boxes per acre are required to cover the actual costs. Interest on the investment commences when the yield goes above 110 packed boxes per acre.

The accompanying table shows the general economic condition of the orange industry. The single year figures are not entirely representative of a particular year because high yields are usually accompanied by low prices, and vice versa.

The 5-year average, 1910-11 to 1914-15, includes the year of the disastrous freeze. The average for the other four years has been 145 packed boxes.

Valencias Show Up Better.—These figures apply to all oranges. Valencia groves have probably averaged a little higher in per acre production and have certainly averaged higher in value per box, so that the net value of the crop has been greater. To offset this, however, there is a very large acreage of non-bearing Valencias which may make quite a change in the market conditions within the next few years.

State Average Value \$1000.—Such figures would indicate that the orange industry is showing reasonable returns on a valuation of \$1000.00 per acre as a state average. (This is as high or higher than any of the staple crops pay on fair valuations, as indicated by Federal surveys.) Groves which produce 1700 packed boxes per acre or which return \$1900.00 net per acre per year (such instances have recently been called to the attention of the writer), may be certainly taken as very exceptional; they do not represent a proper basis for study of the orange business. Further than that, one year's returns can never be a true criterion of any business. In an industry such as this, where the investment is large and the time before productivity is reached is considerable, a five- or ten-year average

WITTE ENGINE WORKS, 2867 Oakland Avenue, Kansas City, Mo. 2867 Empire Bldg., Pittsburgh, Pa.

is the shortest interval that can give accurately the conditions.

The strongest lesson to be gained from the table submitted, in the judgment of the writer, is the relation between per-acre yield and net profit. The following tabulation shows the rate of increase in profit with increase in production, assuming as before the relatively fixed per-acre costs and average prices.

Yields Determine Value.		
Packed boxes per acre	Yield above fixed cost	Net value per acre
Low		
.....110	0	\$ 0.00
.....125	15	18.00
Usual		
.....150	40	48.00
.....175	65	78.00
.....200	90	108.00
.....225	115	138.00
.....250	140	168.00
.....300	190	228.00
Occasional	400	448.00
Exceptional	500	468.00

The net value as shown is doubtless somewhat too high in case of the higher yields, because as already pointed out the per-acre cost of production is generally greater on high yielding groves than on the low-yielding ones.

Profit depends on the combination

FORBES' VIVENE LIQUID FERTILIZER

Contains the vital elements that plant life needs for growth. Produces 34 flowers on a Shizae thus in 28 days. Try this wonderful fertilizer. Easy to apply—inexpensive—odorless. One tube treats 10 plants. Mailed direct from manufacturer, if you desire. Full directions with each tube. One tube, 25c—Five tubes, \$1.00.

FORBES CHEMICAL CO., 33 St. Ann St., San Francisco

of favorable location and cultural conditions with the proper personal equation in the owner. The latter is of utmost importance in the orange business because of the exceptional amount of industry, knowledge, and common sense required.

Prices for seedless raisins will be named in a week or two. Efforts have been made to keep prices down to stimulate consumption; but last year with such prices, San Francisco speculators bought much of the crop and advanced the price one to two cents a pound so this object was defeated. It is expected that the price will be higher this year.

Faster and Better Plum Packing.

[Written for Pacific Rural Press.]

The best system of plum packing we have heard of is that described as practiced by George Sykes, now working in Sacramento county.

Ordinarily, each packer picks fruit from one of several lug boxes or baskets, guessing as to the size he wants (this varies about 19 per cent in each layer in the usual plum baskets) and testing them out by squeezing or finding them too loose, then throwing them back and trying some more. It is hard on the plums, for it bruises and brushes their bloom off. It is hard on the packer because he works by the crate. It is hard on the grower and on the shipper, for poor packing results; and lowered prices follow.

In Mr. Sykes' system, a three-foot square bin four inches deep is covered with a canvas onto which plums are emptied from the field boxes ready for the grader. On one side of this bin is another of the same size with a bench for packers at its far side.

A bin just like the others is placed against them so it overlaps half of each. A similar one is put on the opposite side. If desired, another pair can be added, one directly on each side of the grader. Each of the bins except the first two, has two packer's benches.

The grader puts the biggest plums into the first bin added to his own, where one packer can usually handle all of that grade. The smallest fruit is put into one of those beside him. The medium sizes are rolled into one or another of the remaining bins by simply lifting the canvas and letting them roll.

There is sufficient variation in sizes even at that, to allow packing the sloping baskets, but there is much less of undesired sizes in the way of each packer; and it is far quicker. It encourages first-class packing and prevents repeated handling of fruit by the less experienced packers.

Reputation for Good Packing.—"Here is one of the best plum packs we inspected," said F. C. Brosius on the Sacramento docks recently. Jas. Elliot of Courtland allows the top layers to be handled only once, on account of the bloom. They are packed directly from the picking baskets or boxes. We don't often have to inspect his stuff, for it is standard from top to bottom. He pays a boss \$2.50 per day to do nothing but watch his packers. They get 6 cents a crate and can put up about 40 crates per day. All plums without stems are sold locally. They would be apt to leak on the long journey East, and smear the others. He doesn't permit loose packing, varied sizes, or lack of uniform maturity.

AVOCADO VARIETIES COMMITTEE.

A most important committee of the California Avocado association has been organized. It will deal with the classification and registration of varieties of the avocado. As there are over a hundred varieties, each of which at the present time has its advocates, the work before this committee is no light task. It is of course highly desirable, from a commercial standpoint especially, that the varieties of real importance and unquestioned value be selected

and their number reduced to a minimum, in order to avoid confusion and aid in standardization. Varieties of little value or having specific drawbacks, however admirable they may be from some one viewpoint, should be eliminated from the consideration of the prospective commercial grower. The committee appointed for this purpose is believed to be exceptionally qualified to exercise unbiased and authoritative judgment. A negative qualification necessary for eligibility to appointment upon it is that none of its members shall be commercially interested in avocado culture. It comprises the following; Dr. H. J. Webber, chairman; Prof. Ira J. Condit, William Hertrich, H. M. Haldeman. Dr. Webber is director of the University of California's citrus experimental station at Riverside. Prof. Condit is in the Agricultural department of the University at Berkeley and is especially charged with the investigation of the avocado. Mr. Hertrich is head of the extensive horticultural and farming interests of Henry E. Huntington. Mr. Haldeman, although manager of the Boynton Company, which deals in pumps and machinery, is an enthusiastic amateur grower of the fruit in question, and is particularly well informed on the subject. A fifth member will be appointed shortly.

The committee will register only varieties that have borne desirable fruit in reasonable quantities. It will act as judge for the association at its exhibitions, either of nursery stock or trees; and will decide upon a form of certificate to be awarded to the growers of varieties deemed worthy of recommendation. Thus, many of the objects sought to be attained by the organization will be achieved directly through the work of the above-named gentlemen.

CONVENIENT GRANARY.

[Written for Pacific Rural Press.]

Convenient granaries are not so common as they should be on California farms, especially where hogs or other livestock requiring grain are kept.

On the River Bend ranch at St. Helena a granary 14 feet square has been constructed which saves waste of grain and makes winter feeding a much pleasanter task.

The walls of the building are studied and covered with rustic on the outside. Half-ton bins are built next to this wall on three sides, being built perpendicularly and raised from the floor 16 inches. They are made of tongue-and-grooved lumber, and have a bottom sloping toward the center of the building.

A small sliding window at the bottom is used in emptying the bin into buckets, the glass allowing the feeder to tell at a glance the amount of grain in the bin and also the kind.

These bins are filled from the outside, hinged windows being placed at the top of each bin and opening outward, near the top of the outside wall. By this arrangement the bins can be filled direct from the wagon by opening the window and pouring direct from the sack.

The building is situated close to the hog lots and allows exact measurement of all rations in winter or summer.

Two Thousand Boys in Agricultural Clubs

[Written for Pacific Rural Press.]

The Boys' Agricultural Clubs are making good farmers out of farmers' boys and at the same time making better farmers out of the boys' fathers.

Such was the impression gained by the writer in a day's tour by auto with the supervisor of Northern California Agricultural Clubs.

In the county we were traveling, three kinds of clubs were in operation, a pig club, a corn club, and a poultry club. Our first visit was made to a pig club member, who has two registered Poland China gilts. Their appearance indicated that great care and judgment had been used, first in selecting them, and then in feeding them. Both pigs were of the most approved type, and were finished in a way that would make any old show man sit up and take notice. After the contest they will be used in founding a purebred herd on that ranch, where the father has heretofore grown grades.

As poultry was not included in the supervisor's work for that day, we next visited a corn club member. Owing to the dry season the boys in this club are working at a disadvantage for a large yield, but they are sticking to their guns nevertheless; and it is expected that their better methods will be equally convincing as in favorable years. While their yield will be small, the neighboring farmers are working under the same handicap. And so we went from member to member, each with his problem and each welcoming advice.

The most impressive thing about it all was the interest and personal acquaintance with his crop that each boy displayed. Many of them have been born and raised on the farm but

it has taken this competitive spirit to bring out the enthusiasm which can be best recognized in youth.

But our companion advised us that this movement is not simply a boy movement. It is a man movement as well and to illustrate his point he related the story of a Napa county boy who grew corn three years ago for the contest.

By carefully selecting his seed and pursuing good cultivation methods he was able to grow a hundred bushels of corn to the acre while the average for the State is between 34 and 35. He is a prize-winner. He also became a corn seed king in that county, for progressive farmers began buying seed from him; and the corn yield of the entire county has been increased.

Another result of seed selection was in Ventura county where a bean club is in operation. An enthusiastic member reported that he had been counting the number of pods on his vines; and found one vine that carried considerably more than the rest of his patch. This set other members to counting pods, with the result that a retired farmer's interest was aroused; and before the end of the season a count showed that the retired farmer topped the list with a vine carrying several hundred pods. Now everybody in the district who could secure them has planted selected bean seed and a great increase in the bean yield in the entire district is expected.

Some idea of the way this movement is taking root may be judged from the fact that there are somewhere near 2000 boys enrolled this year, which also means the same number of farmers. Thirty of these boys will be taken east this fall, in a private car, visiting the farms in various agricultural centers. About 600 of them will be taken to the University Farm for two days. Besides the desire to have the best, these trips are the driving wheels of progress in the work. And the work has really only commenced, having been in operation but three years.

ROTATING ALFALFA WITH CULTIVATED CROPS.

[Written for Pacific Rural Press.]

To insure continued good crops of alfalfa on his 40-acre ranch in Stanislaus county, J. A. Goodall started a rotation system two years ago. The land had been pastured by his herd of registered Jersey cattle. In 1915, a crop of oat hay was followed by Egyptian corn. This year the land was again planted to oats in the winter and will be planted to beans for a summer crop.

Mr. Goodall believes that with this two-year rotation system, his land will grow better crops of hay, and it will not only have had a rest, but will also be cleaned of foxtail by the cultivation.

He is a firm believer in the value of old alfalfa for pasture. His herd of Jerseys average, at this time, a pound and a quarter of fat, alfalfa hay and pasture being the ration fed to all except a few on official test, which are being fed a light grain ration.

SHURE-KIL SPRAY

TRIAL GALLON PREPAID FOR \$1

is transforming hundreds of California orchards from a poor, scrawny, small-bearing condition to a state of perfect tree-health. It will make your trees sturdy, healthy and full-bearing. Sick trees can not bear healthy fruit—SHURE-KIL absolutely gets the pests that are getting your trees—one application proves what SHURE-KIL can do. Will not burn or otherwise injure Fruit or Tree when applied as instructed. SHURE-KIL is 50 per cent more efficient than fumigation, and it costs 35-60 per cent less! Send \$1.00 today and we will ship a trial gallon can, prepaid to any Express Office in California.

Mechanical Power on the Farm.

STATIONARY WORK FOR FARM TRACTORS.

A feature of farm work that is somewhat overshadowed by the tractive uses of a farm tractor is the extent to which the machine can be used for stationary work, such as pumping, threshing, filling silos, sawing, etc. The well-informed farmer nowadays inquires carefully into the belt horse-power rating of

the farmer uses his tractor for pumping to irrigate his land after having checked, plowed, harrowed, and seeded it with the same tractor. Then when the water is drawn off and the rice is ready to cut, he uses his tractor to pull a binder or two, after which he again uses the belt pulley to run his thresher or separator. This practically keeps the tractor busy all the year round.

Tractor Pumping Water for Irrigation.

the machines under his consideration.

Some of the small tractors have a high development of horse-power available for belt work. The advantage of a portable power plant is obvious. Some California orchardists having several wells, have saved the expense of separate power plants by using a tractor to run from one well to the other, pumping at each.

Rice growing provides a cycle of almost continuous work for a small tractor. In some of the rice districts of California not accessible to water laterals or irrigating canals,

Many owners keep their tractors going day and night.

The illustration shows a Big Bull Tractor on the ranch of the Moulton Irrigated Lands Co. at Colusa pulling a 12-inch centrifugal pump. The photo shows the manner in which many small tractors are employed on farms for irrigating. Attention is called to the volume of water being lifted and the distinct clearness of the tractor parts in the photo, showing the freedom from vibration while running. The above company is providing employment for three Big Bulls.

TRACTOR DEMONSTRATION AT STATE FAIR.

[Written for Pacific Rural Press.]

One of this year's new features of the California State Fair will probably be a big tractor demonstration. Secretary Paine says that the State Agricultural Society has secured 40 acres of land just outside the Fair Grounds which may be used as a field for such demonstration.

The tractor demonstration is an established institution in the Middle West States, and is doing much not only to show the farmers the advantage and economy of tractor power and the various uses for which tractors are adapted, but is also helping the manufacturers to improve their tractor and tractor implements to meet the farmers' requirements.

There are a large number of manufacturers of tractors and tractor implements in this State; and most of the Eastern manufacturers are represented here. Therefore a California demonstration need not be second to any in the country in size and educational value.

The tractor and tractor implement people will no doubt furnish the material and program for a big and educational show of tractors in action.

STEAM-CLEANED DAIRY.

[Written for Pacific Rural Press.]

Steam is better than boiling water to sterilize dairy utensils, and is not much harder to get. In these days when our butter must be improved by improvements all along the line including the production of clean practically sterile cream, people are casting about for economical means of cleaning dairy utensils.

A. J. McPherrin of Imperial has about 110 milk cows whose milk he separates in a No. 25 De Laval separator. He sells the cream, and feeds the milk to hogs. Geo. V. Rude manages the ranch.

Utensils are cleaned in the separator building. This is screened, has concrete floor, reinforced with woven wire fencing, and is furnished steam from a 2 h.p. De Laval Little Giant upright boiler nearby. The boiler rests on a concrete platform and burns distillate through a Siebert burner. A 100-gallon distillate tank is located on a high platform nearby. Steam runs the separator and will probably run the Babcock tester which is to be installed. A vitrified sewage pipe carries the utensil wash water 300 yards away.

Announcing THE SANDUSKY TRACTOR "THE LITTLE FELLOW WITH THE BIG PULL"

and Special Wheel for Beet Plowing

The illustration below proves another of the many points of the universal usefulness of The Sandusky Tractor. The picture below shows The Sandusky Tractor equipped with our "special beet wheel" for Beet Plowing and pulling a 2-Row Beet Plow. This "special wheel" has been thoroughly tried out in the San Fernando Valley for the edification of the Beet Growers of California.

Does the Work of Five Good Teams and Men

THE SANDUSKY TRACTOR is adapted to your needs. The first logical operation on undeveloped land is clearing; then comes breaking, discing, harrowing, seeding, harvesting, threshing, shelling, filling silos, hauling crops to market and fertilizers to the farm, probably wood cutting and a dozen other operations in and about the place.

The Sandusky Tractor

is manufactured throughout in our own shops by the highest grade mechanics obtainable and our aim is to produce for you a dependable machine, capable of standing up under the severe use to which equipment of this kind is subjected, ensuring you of its being a lasting and profitable investment.

BOOK, "POWER ON THE FARM," FREE.

Write for a copy of the new 40-page edition covering the latest refined 1916 Model E, its uses, and containing other valuable information. Tell us fully about your power problems and we'll gladly help you solve them WITHOUT OBLIGATING YOU IN ANY WAY.

LAYNE & BOWLER PUMP

Mechanically Perfect

This pump is ruggedly constructed to meet successfully the requirements of the most severe service. All castings and fittings of iron, bronze, brass and steel are made by skilled workmen under the supervision of foremen of long experience—men who have been with this company for years and know every phase of pump construction from A to Z. Every part is thoroughly scrutinized, inspected, tested and fitted before the pump is assembled ready to leave the shops in order that every thing may be absolutely perfect.

EVERY PROSPECTIVE WATER DEVELOPER SHOULD WRITE FOR OUR NEW, ELABORATELY ILLUSTRATED CATALOG NO. 25. IT DESCRIBES OVER TWENTY DIFFERENT STYLES OF LAYNE & BOWLER PUMPS. IT'S FREE.

LAYNE & BOWLER CORPORATION

Belting

That Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a free sample of Test Special together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

HOME-MADE AUTOMATIC WIND-MILL CONTROLLER.

[Written for Pacific Rural Press by
Wm. Curtis Clark.]

Patented devices for controlling windmills generally release by tripping a dog or trigger, which allows the tail to swing back with a bang and jar so that mill men generally discourage their use.

The device described lets the mill

The windmill fills an old oil can with water, which shuts it off. The water drains out slowly, which releases the mill again. A is overflow pipe to can. B, can in position when empty. C, can when full. D, well casing. E, controlling lever.

on and off, even more gently than by hand. If the tail spring is stiff, it may be necessary to put a weight into the can as a partial counter balance.

The materials necessary to make the automatic controller are, one coal oil can, one common 3/4-inch hose bibb, two rubber washers and lock nut, short length of hose with bibb connection and 3/4-inch overflow pipe.

Rig a five-gallon coal oil can with wire bail handle and fasten a faucet (bibb) into the side near the bottom. Connect a short piece of hose to the faucet so it will reach into the well casing when the can hangs on the control wire.

Fasten the can on the control wire at a handy height so the hose will slip in and out of the casing freely; then put an overflow pipe into the top of the water tank; let it come out and extend straight down into the coal oil can.

When the tank is filled, the water runs down the overflow pipe and gradually fills up the can. The increasing weight on the control wire pulls the shut-off lever and stops the mill.

The faucet valve in the can may be turned as desired, to drain into the casing, thus timing the outflow of water in the can either fast or slow according to the consumption of wa-

ter in troughs or elsewhere.

The water from this faucet runs all the time, draining into the well casing to avoid mud. When the tank overflows, it fills the can much faster than the faucet empties it. When the weight of the can full of water has shut off the mill, the water runs out slowly and the tail spring makes the mill get busy again.

Tank Frame Construction.—Note that braces of tank house frame come only flush with outsides of timbers so they can be boarded over tight when desired. Note also that ends of 6x6 timbers under the 2x12 tank platform rest directly over the tops of legs. The centers of these 6x6's are further supported by a 6x8 cross-wise and it resting on the center legs of the other two sides of the frame.

Notice the corner braces to and under the windmill mast, which is set directly over the well but beside the tank with good clearance.

Self-Draining Pedestals.—The legs are set in concrete pedestals, but unlike the usual system, which is to set them in a hole in the concrete. Such a hole continually holds moisture and soon rots the legs.

Here the pedestal has a depressed corner on its upper surface so the leg would shove against raised concrete shoulders on the two outer sides. All moisture drains away from the other two sides of the leg. A center post would drain from only one side but would be set in the center of its pedestal.

Napa grapes are estimated at 35 per cent of normal.

General Agricultural Review.

DECIDUOUS FRUITS.

Sonoma prunes are better than expected, being of good size.

Sonoma walnuts have the biggest crop ever, according to O. E. Bremner.

Frost damaged Tuolumne walnuts somewhat, but apples promise a fair crop.

Most of the peaches on New York market June 23 were from Georgia and Arkansas.

Packers are reported buying old dried peaches at 5 1/4 cents and new crop at 6 cents.

Napa prunes and pears are estimated now at 40 and 50 per cent normal respectively.

Prune dropping in Santa Clara is reported not to have been so heavy this year as usual.

One company is said to have bought 50 cars Elbertas around Armona at \$20 per ton.

Gravensteins will be moving from Sonoma county next week. The biggest and best crop ever, is reported.

Prunes have been dropping heavily in the Chico district. Growers here are predicting a 7-cent basis.

The growers' cannery at Kingsburg has sold all of its last season's pack and expects to begin this season's run Jul. 15.

Many jobbers and retailers of canned fruits have short supplies as indicated by orders for shipment as soon as packed.

Business men of San Jose raised \$1000 in a few minutes for promotion work of the prune and apricot growers' organization.

It is reported that shipping companies have bought 100 cars fresh peaches in Visalia and Tulare districts at \$14 to \$17 a ton.

The new prune and apricot growers' organization is not committed to the policy of selling dried fruit at auction or any other way as yet.

A 6-cent prune basis was unanimously decided reasonable for growers to demand this year, at a meeting of perhaps 150 growers at San Jose June 23.

Pulling The Big Guns In Europe

weighing hundreds of tons, over almost impassable roads, are found only tractors of the "Creeping Grip" type. Round-wheel tractors are helpless before this gigantic task. *Your tractor should be a*

BULLOCK CREEPING-GRIP Tractor

Travels on its own track—lays it as it goes. No soil too loose or wet—no ground too rough for the Bullock. No slipping—no miring—no spinning wheels—no wasted fuel—every ounce of power is exerted at the drawbar in PULL.

Best for tilling—can't pack the soil—will plow that "soft field." Unequaled for road work—furnishes stationary power without blocking. Very easy to operate, the most economical to buy, results considered. Our 12-20 Creeping Grip is the ideal tractor for the orchardist, built low and narrow and turns in its own length, patterned exactly after our larger and higher priced machines.

Write for particulars and free "Creeping Grip" Book.

BULLOCK TRACTOR CO.

1805 Diversey Parkway
CHICAGO

Apples arriving in San Francisco infested with codling moth larvae will be confiscated or returned to original shipper according to San Francisco horticultural commissioner Dudley Moulton.

Santa Clara canning apricots have been bringing \$50 to \$55 per ton and there have been some sales of dried apricots at 13 1/2 cents with at least one at 14 cents, reports the Growers' Information Bureau.

Between June 8 and 20, \$1720 was subscribed to the Cal. Peach Growers, totaling \$765,000. It is believed that if the full \$1,000,000 of stock is secured before dried peach marketing, 6 cents can be secured.

For four years, Harry Adams of the Cal. Fruit Distributors has tried to get from railroads the privilege of stoppage in transit of carlots of fruit for partial unloading without extra charge. Several eastern railroads have recently agreed.

GRAPES AND SMALL FRUITS.

Blackcap raspberries are being grown on a 5-acre ranch in Los Angeles county.

Three hundred and fifty raspberry and Loganberry pickers are needed in Whatcom county, Wash.

Sonoma winegrape vineyards have been very extensively replanted with about 1/2 prunes and 1/2 apples.

On the A. B. Humphrey ranch in Sacramento county a 20,000-crate crop of Tokays is expected where the vines had been irrigated for six days before the frost.

The Associated Raisin Co. prices for foreign shipment, recently issued, are 10 per cent higher than a year ago. During May, 2600 tons of raisins were exported.

About 70 per cent of the Emperor crop is reported signed up at \$40 to \$50 per ton and about as much of the Malaga crop, at \$20 to \$25. This is better than last year.

Success of Sebastopol Berry Growers in extracting Loganberry juice from about 12 tons of berries per day, is stimulating interest in Humboldt in Loganberry culture.

A hundred and fifty carloads of strawberries have been sold for delivery to North Dakota by the Hood River Apple Growers' Ass'n and the White Salmon Fruit Growers' Union.

John D. Rockefeller recently won first prize for the largest strawberries at the spring exhibit of the Tarrytown Horticultural Society. Some of them were 7 inches in circumference.

Strawberry root weevil has killed hundreds of acres of plants in several counties of Washington. Two-thirds of an ounce of carbon bisulphide in a saucer every 5 feet over infested ground left 6 hours under a canvas made gas tight by painting with linseed oil, is recommended.

CITRUS, OLIVES, AND NUTS.

Thrips are responsible for the light almond crop in certain sections this year, according to H. B. McCoy of Arbuckle.

It is announced that the Associated Raisin Co. has offered the use of its selling force to help the olive growers.

A San Francisco orange dealer was recently caught grading culls and packing them in wrappers and boxes under a well-known first-class brand.

Citrus shipments from Southern California for the week ending June 23 were 1022 cars, totaling 28,174 cars for the season from this district.

Four hundred olive pickling tests were made during last season by W. T. Oglesby of the University of Cal. Lye of 2 to 4 per cent strength was found best to destroy bitterness.

Many oranges and lemons infested with red and purple scale have been

received in San Francisco but will hereafter be condemned by the new horticultural commissioner, Dudley Moulton.

The Cal. Fruit Growers' Exchange sales agents of Boston, New York, Chicago, and Minneapolis recently told a meeting of Porterville orange growers that it is of utmost importance that they safeguard the markets against early shipments of immature fruit.

MISCELLANEOUS.

The fourth reader in elementary schools of Cal. is to have 50 extra pages dealing with modern farming.

Imperial county bees, imported to pollinize cantaloupes, permit export of scores of cars of honey every year.

The official sparrow destroyer of San Diego got 323 birds during his first month. He got 5 cents each. Later the price rose to 10 cents.

An attendance of about 4300 students, or three times as many as 5 years ago, was expected for the University summer school at Berkeley, June 26 to Aug. 5.

The California Highway Commission is mailing a bulletin including a 30-inch map showing proposed and completed State highways in Cal. Anyone may have a copy free by writing the commission at the Forum Bldg., Sacramento. Many picturesque scenes and descriptions are given, indicating the engineering triumphs of the Highway Commission and the usefulness of their work.

GRAINS AND FIELD CROPS.

Barley opened at \$22 a ton at Kings county shipping points.

Two hundred acres of wheat burned near Delano last week.

Stockton bean acreage is increased 50 per cent as now estimated.

Tuolumne grain hay is of finest quality well filled with plump grain.

Several hundred acres of grain in Yolo county were recently burned.

Sonoma lowland hay is fine, but the total crop is estimated at 50 per cent.

About 250 tons of stacked hay burned near Tulare recently. No insurance.

The Delta onion prices are the best in years and the onions of uniformly good size.

It is estimated that 3,000 cars of cantaloupes will move from Turlock this season.

California carlot cabbage shipments totaled 280 for this season up to June 20.

Napa lowland hay is the best seen this year by a Pacific Rural Press representative.

Forty to 50 cars of ice are used per day for shipment of Imperial Valley cantaloupes.

Wheat in the Huron region is estimated at 3 to 6 sacks per acre, with a few 8-sack crops.

Dinuba watermelon acreage is light, and the early arriving melons are bringing good prices.

Total vegetable shipments from southern Cal. for the season to June 23 amounted to 4,449 cars.

Blackeye beans were not so extensively planted this year as last on account of the large carryover.

Widespread acreage of hops in Sonoma and Mendocino counties has been interplanted with prunes.

A gasoline explosion started a fire in Merced county which swept about 2000 acres of grain and stubble.

Carload potato shipments in Cal. this season until June 20 totaled 473 as against 8308 or more for U. S.

Sudan grass makes hay equal to timothy and of much higher yield, as determined by the Arizona Expt. Sta.

The Growers' Committee of Fallon, Nevada, vicinity are campaigning for a maximum 1917 sugar beet acreage.

California has 14,935 acres of cantaloupes this year. The next

highest figure is 6,000 acres in Georgia.

The Manteca cannery started its run this week with beans. Orders for tomatoes already exceed last year's pack.

Florida had shipped 989 carloads of watermelons before June 20 as against 1 from Cal. according to U. S. Dept. Agr.

Aerial potatoes planted by J. A. Smith of Tulare county produced a quart of tubers which this summer produced 83 pounds.

Express shipments of Merced tomatoes totaled 70,160 pounds June 22, all to California points. Bell peppers also are moving strong.

The Biggs Rice Experiment Station is producing enough seed of the

new variety which ripens 3 weeks ahead of Waterbune, to seed 20,000 acres.

Pasture and grain land seven miles wide and 12 miles long in Glenn county was burned last week. About 20,000 sacks of grain was lost. One-third insured.

Goleta-Carpinteria lima bean growers hope that in the few places where they have a poor stand, the earliness of the season will permit runner pods to ripen.

Cantaloupe carlot shipments from California points totaled 2642 for this season until June 20 out of a total for U. S. of 2702. Florida and Ga. are the competing States.

The Southern Pacific Co. shipped out of the State about 400 carloads

per day of perishable farm products during the week June 11 to 17 besides about 75 cars per day within the State.

To prevent harvester and threshing machine fires, a fan has been invented by a Washington man to attach to the separator to remove dust and smut which have been found explosive. The smut can be destroyed instead of spread to infest the fields.

In the 15 principal melon producing States this year, the U. S. Dept. Agr. reports watermelon acreage at 100,965 this year and 98,508 last year; cantaloupes 41,273 this year and 41,981 last year. Texas and Florida each have about 4 times as many acres of watermelons as California.

1819 Miles in 24 Hours

As far as from New York to Denver

With a Hudson Super-Six

The Supreme Endurance Test

The Hudson Super-Six, in many a test, has proved itself the greatest car that's built.

No car has ever matched it in hill-climbing. No other stock car ever went so fast. None ever went so far at top speed. And no motor of its size ever showed such reserve power.

But here is a record which perhaps means most to farmers who buy cars.

Best Record by 52%

A Hudson Super-Six with stock chassis was driven 1819 miles in 24 hours on the Sheephead Bay track on May 2nd. The average speed was 75.8 miles per hour.

That car, in a single round of the sun, went the distance from New York to Denver. It went 52 per cent farther than any other stock car had ever gone in that time.

One man drove it all the way. No man could do that in a car which was not vibrationless.

That man went farther in 24 hours than a man ever traveled before.

50 Miles in One

Some engineers figure that one mile at racing speed equals 50 miles of ordinary driving, in wear and strain on motor.

This car had run 2,000 miles before that test, at average speed of 80 miles per hour. So this 24-hour run made 3,800 miles which the car had been run at top speed—as high as 102 miles per hour.

Yet no part or bearing, when the engine was inspected, showed any appreciable wear.

The Thing You Want

What you want in a car above all else is reliability. And that's what these tests are proving.

It would take ten years of road work, perhaps, to show what we prove in a few days of speed work.

In all our tests we use a stock chassis.

The motor is exactly the same as in every Hudson Super-Six. So every man who buys a Super-Six gets the same super-endurance.

A Patented Motor

The Super-Six motor is a Hudson invention, controlled by Hudson patents. The principle which gives its utter smoothness is entirely new. That is why it out-performs any other car that's built. Or any car that can be built.

It develops 76 horsepower from a small, light Six. That is 80 per cent more than old types.

You rarely use that power. In ordinary driving you run at half its capacity, so the motor is never strained.

But the owner of a Super-Six knows that he has the power. He knows that his car is a master. He knows that in speed, in hill-climbing, in quick pick-up, no car can do what his does.

He takes pride in those facts. But his chief satisfaction lies in the car's endurance. He knows that his car will last. That another car at half the price might cost more in the long run.

Don't buy a fine car until you know the Super-Six. You would surely face years of regret.

Rape Pasture Makes Quick Pork.

[Written for Pacific Rural Press.]

The practice of putting rapid gains on a hog is increasing all over the State, through better feeding and better breeding.

Often, it is claimed that such gains may be profitable for the small grower who can give more individual attention to his hog lots, but that it is not economical for the large grower.

Experience on the Vina ranch of the Stanford University does not warrant this assumption, however; for while their swine number into the hundreds, they make both quick and economical gains.

An illustration of this was shown in April, this year, when a large number of October pigs were seen with an average weight of 170 pounds.

Drills Rape Sept. 1.—These hogs had been fed liberally a ration of shorts, skim milk, ground barley, and corn, and rape pasture. Manager Houseman states that excellent results have been obtained with rape as a winter pasture, drilling the seed in rows about September 1. This provides pasture for the fall pigs until June; and when supplemented with plenty of grain, makes quick and economical gains.

But good feeding is not all that makes the swine herd on this ranch a paying one. The housing system as diagrammed in our issue of April 15, reduced mortality to the minimum at farrowing time.

SIXTY-SEVEN PER CENT PROFIT IN 112 DAYS.

[By Harold Spaulding, Porterville, Cal.]

On February 19, 1916, the contest started. As each fellow had to weigh his pigs at the start, I got two little pigs into a small pen and weighed them in a barley sack.

I had chosen a registered Duroc-Jersey from a litter of eight and a Poland China grade from a litter of six. The Duroc-Jersey was four and one-half weeks old and weighed 39 pounds. The Poland-China was eight weeks old and weighed 54 pounds.

As the pigs were small, they did not require a great deal of feed, and I let them run awhile on alfalfa pasture. In addition to this, I gave them all the skim-milk they would drink. In a couple of weeks I took them off the alfalfa and penned them up. I made a self-feeder and fed rolled barley, dry. Besides the skim-milk now, I fed a great deal of green barley. When they became tired of this diet, I started feeding middlings and rolled wheat. The rice middlings were mixed with milk and the wheat was fed dry in the self-feeder. The rice middlings were mixed into the milk, one part of rice to four of milk. As time elapsed they grew

tired of rice middlings, milk, and rolled wheat, so I got some tankage. They gained perceptibly on this feed until the close of the contest. Following is my account with the pigs:

Original value	\$ 5.50
Cost of all foods given	10.50
Cost of pasture	10
Caring for pigs (15c. per hr.)	2.80

Total cost	\$18.99
Final wgt. 425 lbs. @ 7½c.	31.87

Net profit\$12.88
[Harold Spaulding will receive a registered bred sow for this work in the Porterville Boys' Pig Club.]

CORN AND HOGS ON FRUIT RANCH.

[Written for Pacific Rural Press.]

Among the orchardists of Napa who are growing purebred hogs as a by-product is the firm of H. E. Boudier & Son.

There are 30 acres in the ranch, ten in young orchard, and the balance in use for hay, pasture, and alfalfa.

Corn, pumpkins, and alfalfa are the principal crops grown on the ranch for hogs, both the corn and pumpkins being interplanted in the young orchard. Big yellow dent corn is planted and yields on the average one and a half tons to the acre. Last year pumpkins were planted in the corn but did not yield as well as expected, probably due to the shade of the corn, so this year they have been planted in a separate field.

Only two acres are in alfalfa, this being irrigated by large sprinklers on account of shortage of water. It is cut green to be fed during spring, and fall, with corn, ground barley, shorts, and either tankage or skim milk.

During winter when the green alfalfa is not available, pumpkins furnish succulent feed. By this system 40 to 50 purebred Durocs of all ages are kept.

SMUTTY WHEAT FOR HOGS.

To the Editor: Is wheat with smut in it safe for hogs if boiled?—J. P. T., Roseville.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

[Smut in corn is generally considered rather dangerous if animals get much of it. It is not uncommon for smut in the various grains, especially wheat, to contain ergot, and this is likely to cause abortion. However, where wheat is well mixed and particularly boiled, there should be no undesirable results from feeding it.]

GRAIN SORGHUM SILAGE.

[Written for Pacific Rural Press by D. L. Schrader.]

Feterita and Egyptian wheat, both badly frosted, were used by Claus Popp of Stanislaus county last fall to fill his silo. Cows cleaned up the feterita in good shape, but refused the Egyptian wheat, perhaps because it was frost bitten.

Barley was planted on the feterita land this season. There was no trouble plowing, for the feterita rows were three feet apart; and a 12-inch moldboard plow turned the roots completely under. The barley hay showed only an occasional bunch of roots. Mr. Popp planned to plant the piece to Indian corn to fill his silo this fall.

Grapewild Farm Berkshires

Grand Leader 2nd.

WORLD'S FAIR GRAND CHAMPION Berkshire Boar is bred in Champion lines—won championship honors in one of the greatest Berkshire shows ever held—sires champions, and we have championship material for sale. WORLD'S CHAMPION BEST, 127963, The World's Greatest Living Boar.

His sons have never been rivaled in the show ring. His daughter, Rival Lady 33rd, was for 3 years Grand Champion of America, and during her career produced two litters per year. At the Panama-Pacific International Exposition show the blood of this great boar won for Carruthers Farms the Premier Exhibitors' banner.

40 head of the 47 offered in the sale are either sons or grandsons, daughters or granddaughters of the Great Boar. One of the leading breeders of the Middle West has pronounced this sale the greatest Berkshire Sale made by one breeder in recent years.

State Dairymen Invited to Humboldt.

[Written for Pacific Rural Press.]

A SUCCESSFUL DAIRYMEN'S ASSOCIATION.

If dairymen have any doubts as to the advantages of co-operative associations they should visit Humboldt county and get in touch with the work that has been done since 1912 by the Humboldt County Dairymen's Association.

The original objects of the association as set forth in the by-laws were: to increase the quantity and improve the quality of dairy products; to encourage the use of purebred sires; to co-operate in purchasing seed, feed, fertilizers, etc.; to study needs of soil and increase productivity; to protect health of stock; to promote sanitation in dairies; to hold regular meetings to discuss matters of interest to dairymen; to occasionally engage speakers from abroad and to promote in all possible ways the interests of the dairymen of Humboldt county.

R. H. Flowers, of Ferndale, secretary of the association, points out that the association has done its biggest work in the purchasing of seed for its members—better seed than they formerly bought locally, and at a price much lower.

Each month a meeting is held at which anything of importance to the dairymen of the community is considered; and at the annual meetings a banquet is given and new officers

elected. These frequent gatherings, with the annual picnic in the summer, in which speakers from other parts of the State participate, serve to keep the members in touch with both local and State-wide conditions, such as feed, markets, legislation, and breeding.

While originated by the creameries, the association has lent its support to the campaign against turnip feeding in order that Humboldt county butter might not gain a bad reputation in the large markets. Through their organization they have been able to instruct the members of the legislature from their district in regard to all State dairy legislation; and have played a prominent part in local dairy legislation.

Last year, members of the association, with the local creamerymen, were instrumental in getting the California Creamery Operators' Association to hold its 1916 convention at Ferndale. In order to further strengthen their own association, invitations have been extended to dairymen all over the State to be present at the September convention in order that plans may be discussed and action taken in the formation of a State Dairymen's Association. Doubtless leading dairymen from all dairy sections will be present, as an association of this kind would be very desirable.

Breeding 300 Pound Heifers.

[Written for Pacific Rural Press.]

Although he has been using registered bulls over 20 years, and now has a herd of dairy cows that he expects to average 400 pounds of fat this year, J. W. Coppini of Humboldt county is of the opinion that the "most remarkable improvement in a herd comes from the first cross of a purebred sire on mongrel cows."

The heifers from this cross often do better with their first calf than their dams. While he has been able to work a gradual improvement in his herd by use of registered Jersey bulls, he has never been able to make such large increases in succeeding crosses, partly because there is not so much room for improvement.

But registered bulls are not the only factors in building up a high producing herd of dairy cows, according to Mr. Coppini. For the last 12 years he has been weighing and testing his milk and by this means he has been able to keep boarders out of his herd. During the last three years he has been a member of the Ferndale Cow Testing Association, his highest average being 367.5 pounds of fat per cow.

Mr. Coppini makes two cullings in his foundation cows, the first one being made in the calf lots, when the heifers from the highest producing

cows are selected and the others disposed of.

After selecting the most promising ones, they are fed whole milk for a time and gradually the ration is changed to skim milk and pasture. As soon as the carrot and beet crops are ready to harvest in the fall the calves are fed a liberal ration of those with hay and pasture, the object being to always keep them growing.

After freshening they are entered in the cow testing association; and unless some unfavorable condition arises, they are expected to produce 300 pounds or better during their first lactation period of ten and a half months. Mr. Coppini believes that a cow should have six weeks rest between calves. Those not coming up to this mark are disposed of, for Mr. Coppini says "I can't afford to feed a cow that won't make better than 300 pounds of fat a year."

A large portion of the present herd are purebreds, three registered cows having been secured in 1902 and their number gradually increased by breeding since then.

To demonstrate the practicability of his system with herds composed entirely of grade cows, he points to the results secured with another herd of 65 cows of which he is part owner.

This herd was established three years ago at which time the average was 280 pounds of fat. Since then they have been entered in the cow testing association and bred to purebred sires. Last year the average for the herd was 305 pounds of fat. This will be still further increased by breeding and selection.

You need a new DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or settling process of creaming---

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE TIME IS OF GREATEST value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE WORK OF AN improved De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind---

BECAUSE THE LOSSES OF THE poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are greatest at this season.

for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE THE DE LAVAL Separator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

BECAUSE AN IMPROVED DE LAVAL is so much simpler and more easily handled and cared

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

H. L. & E. H. MURPHY, Perkins, Sacramento Co., Cal.

With the Livestock Men.

SWINE AND SWINE BREEDERS.

S. S. Southworth of Napa recently sold three registered Duroc gilts to H. V. Du Bois of Napa and a service boar to the State Reformatory at Yountville.

"Feeding and Management of Hogs" is the name of a new circular by Prof. J. I. Thompson. It may be had free by addressing him at University Farm, Davis.

J. P. Daggs of Modesto recently sold a Duroc boar and 12 sows to Mrs. Cliff Collins, Phoenix, Ariz., and a boar and 6 sows to Geo. Conkle, Imperial, Cal.

C. T. Lynn of Modesto writes that he has decided to devote all of his time to Poland China hogs and will therefore dispose of his choice foundation herd of Holstein cattle.

Pig club work has been carried on during the year by the U. S. Dept. Agr. in connection with agricultural colleges of Ala., Ark., Cal., Ga., Ind., Ky., La., Okla., Ore., and Texas.

The Hopland Stock Farm has recently imported a two-year-old Rival Champion boar from Iowa Farms that will be used as a herd sire at the Hopland ranch.

Carruthers Farms reports the sale of two Berkshire sows and a boar to H. H. Gable of Woodland, one boar to Willowmoor Farm, Redwood City, and one sow to A. Bache of Hollister.

Nate Hauck of Alton, Humboldt county, advises us that he will make his first showing at the State Fair this fall. Mr. Hauck is one of the oldest breeders of large-type Poles in the State but has been at a disadvantage heretofore in making the fairs on account of lack of transportation facilities.

Frank Brush of Santa Rosa has started to fit his Berkshire hogs for the State Fair. This is Mr. Brush's first show at Sacramento and he expects to have a good-sized herd entered. The P. P. I. E. grand champion sow, Riverby Princess, farrowed a litter of pigs, sired by Grand Leader 2nd last week.

A sale of registered Duroc hogs will be held at Mossdale Farm, near Stockton, July 15. J. E. Thorpe, on whose farm the sale will be held,

will act as manager, consignments having been made from the following named breeders in Stanislaus county: John Daggs, J. K. Frasier, Guy H. Miller, W. J. Hackett and L. D. Collins. The sale will not be held under the auspices of the Stanislaus Duroc Breeders' Association.

DAIRYING AND DAIRYMEN.

The Wallace dairy of Ukiah is a new one selling certified milk.

The Napa Valley Creamery Co. has leased the Winters creamery and will begin operations July 1. The ice plant will not be run.

The U. S. Navy will have Prof. O. M. Simpson of the Oregon Agr. College to inspect its butter receipts during the summer. Prof. Simpson's headquarters will be in San Francisco.

During summer months more children die of intestinal diseases than during the rest of the year. Most of these are caused by drinking dirty milk, says the Cal. State Board of Health, which calls attention to the fact that the new law does not go into operation until Oct., so individual care will be necessary this summer.

CATTLE AND CATTLEMEN.

Grass fires last week destroyed over 1800 acres of dry-feed cattle ranges in Merced county.

Beef cattle, 500 head, were shipped from Athlone district, Merced county, to San Francisco last week.

The cost of producing meat is unnecessarily high according to U. S. Dept. Agr. due to waste of feed, mostly of stover or by losing its full value because concentrates are not fed with stover.

HORSES, SHEEP, ETC.

Only 301 purebred horses were imported to U. S. in 1915 as against 1210 in 1914.

Faught & Meek recently shipped nine carloads of horses to Utah and returned to Tulare to get as many more. U. S., France, and Italy are buying horses in the big horse market recently opened in Ogden.

Frank Meacham's flocks and herds will not be dispersed on account of his recent decease. Mrs. Meacham and son Harrison have worked with Mr. Meacham many years; and having been fully acquainted with his aims and methods, will carry on his work. The flock contains 3000 ewes. Sixteen rams from among P. P. I. E. prize winners were added to the flocks last fall. Ten Shropshire rams from the East are coming. Recent sales include a carload of Shropshire Merino ewes to S. Williams, Lone Pine; carload Shropshire bucks to Stevens Bros., Woodland; a carload of Red Polled bulls to Wm. Russ, Eureka; two Red Polled bulls to T. M. Burns, Bridgeville. Five hundred prime wethers were recently sold at \$6.65 on the place.

A small girl was told by her mother that she must not be afraid to stay in the dark and go to sleep, as the angels would watch over her. She left the room, and as the window was open a few mosquitoes had made their way in. The mother was rather startled to hear a little while after leaving the room the little girl crying for her to come. "Come quick, mother, because the angels are up here, singing, and one bit me."—Sent by a Montreal Reader.

LIVESTOCK DIRECTORY.

Rates in this directory. 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

JNO. P. DAGGS, Modesto, California.—Breeder of the leading strains Duroc Jersey Swine. The best blood that can be had in the world. None better in the Daggs herd today. Daggs gone out of business, because he did not show at Fair. I should say not. He was just taking a little layoff; just a little rest from the hard work of the show ring. But not a rest from raising prize-winning Durocs and buying the leading strains of the world to improve his herd. So don't fail to write or come and see the Daggs Durocs before buying elsewhere.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

REGISTERED DUROC-JERSEYS—Fall boars and gilts. Weanlings sired by an excellent son of the 1020-pound Royal Munde. We have pigs sired by this boar weighing 240 pounds at 7 months, and out of line bred Golden Model, Crimson Wonder, Orion, Chief, and Colonel sows. For information write Haden Smith, R. 1, Box 84D, Woodland, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. F. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sex. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

REGISTERED DUROC-JERSEY—Weanlings, shoats gilts and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BARGAINS IN CHESTER WHITES—Few excellent bred gilts, \$30; sows, \$35. Service boars, \$20 and up. Weanlings, \$10. Best blood lines. Only good individuals shipped. Dallas Bache, Hollister, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

UNUSUAL BERKSHIRE SALE.
[Written for Pacific Rural Press.]

The announcement of Carruthers Farms that a sale of Rival's Champion Berkshires will be held at Mayfield, Santa Clara county, early in August has created more than ordinary interest in swine circles, according to W. M. Carruthers, proprietor. This is largely attributed to the fact that it is the first large sale of Berkshires ever held in California by an individual breeder. While Mr. Carruthers realizes that he is apt to sacrifice some good hogs at this, his first annual sale, he is cataloging 40 head of Rival's Champion Best blood out of the total of 47 to be sold.

To Berkshire breeders in the West this will undoubtedly mean a great deal; as it is not only the first time that this breeding has been offered in such large quantities at public sale in the West, but in the East as well. The feature has been considered by Mr. Carruthers in making up his offering; and as a result he has included a choice lot of boars as well as sows, with the expectation that many California breeders will want to buy new herd sires.

For those who are in the market for foundation female herds, he will offer about 30 sows ranging from under year to senior yearlings. Some of them will be bred, but most of them will be open, this being a requirement breeders usually demand. As all of them will be entered at the California State Fair, the sale offers an unusual opportunity for strengthening show herds.

NAPA DUROC BREEDERS ORGANIZE.

In line with the progressive spirit of Napa county livestock men the Duroc breeders of that county met at Napa, June 24, and organized a county Duroc breeders' association. The meeting was called by Farm Adviser H. J. Baade, a fair delegation of the 17 breeders in the county being present.

After thoroughly discussing the need of such an organization in raising the standards of the Duroc breed in the county, and of advertising Napa county as Duroc breeding district, C. E. Durell was elected president and S. S. Southworth, secretary-treasurer. At a future meeting, a vice-president and board of directors will be elected and by-laws and constitution adopted.

PROGRESS OF SAN FRANCISCO SHOW.

A meeting of prominent livestock breeders and allied interests was held in San Francisco, June 26, to decide on the feasibility of holding a livestock show in that city next fall.

After a great deal of discussion, it was decided by those present that it would be possible to hold the show at the tentative date set, November 22-28, so far as fitting the stock was concerned, but it was thought advisable to have a larger working capital than the \$10,000 previously suggested.

To bring out an exhibit of stock worthy of San Francisco's patronage a fund of \$20,000 was deemed necessary. Ten thousand of this has already been promised by merchants of San Francisco, and an effort will be made to secure \$10,000 from the livestock and allied interests. Those in charge of raising this sum will report at another meeting July 6.

Sheep in U. S. numbered 2,500,000 in 1914 and 2,450,000 in 1915; but the average price of sheep of all ages increased from \$4.50 to \$5.17 per head according to U. S. Dept. Agr.

A BIG TWO-YEAR-OLD RECORD.

We have just received word from Mr. F. Stenzel of San Lorenzo that the junior two-year-old Holstein, Marie Clothilde Pontiac Creamelle, has just completed a seven-day record with 22.52 pounds of butter.

Although authentic confirmation has not yet been received, Mr. Stenzel states that Miss Hill, in charge of the official test work at the University of California, believes this to be the highest record ever made in the State by a two-year-old. That the heifer is well within the junior two-year-old division is shown by the fact that she is not quite two years and two months old.

AGE FOR BLACKLEG VACCINATION OF CALVES.

To the Editor: At what age should one use blackleg vaccine for calves? How long will germs of blackleg live where all dead animals are buried or burned and how long where the carcass is left exposed?—S. A. M., Gridley.

[The safest method, where blackleg has been or is in the neighborhood, is to vaccinate at 3 or 4 months old and again 6 months later, according to the Cutter Laboratory. About 21 per cent of deaths, where blackleg occurs at less than 5 months of age, are before 3 months of age, but the immunity gained by vaccination under 3 months is so questionable that a false sense of security often results. Spores, which are the "seeds" of the bacteria, live several years unless all of the bacteria are burned or otherwise destroyed.]

HOG CHOLERA PREVENTION

An ounce of prevention is worth ten thousand dead hogs, providing you vaccinate your hogs with Inter-State Vaccine Co.'s hog cholera serum, made under government supervision, licensed No. 25. We guarantee your hogs immune against cholera. Have your banker ascertain if our guarantee is good. We teach the farmers free, how to vaccinate their hogs. Write us for free book on "Hog Cholera." Costs you 22 cents per head to immune your pigs for their natural lives when three to ten days old. Address L. V. Green, Mgr., or Dr. W. E. Embree, V. S., 429-30 Bryson Bldg., Los Angeles, Cal. Inter-State Vaccine Company, Kansas City, Mo.

1/2 Labor Cost
1/4 Power Cost
of Silo Filling

Grip Hook Feed Table puts feed into cutter automatically, saving day wages and board of at least two men on big outfits.

Blower built independent of the cutter. Fan speed can be increased or decreased without changing speed of knife shaft.

Patented, low-speed, one pulley, chain drive blower operates Smalley with one-fourth less fuel than other machines. Extension table on hopper prevents accumulation of litter.

Smalley Silo Filler
7 SIZES

Bevel-edge, whirling blades slice like a lawn mower, cutting feed fine and even. No chunks. Better feed and greater tonnage in your silo.

Patented recutting attachment makes dandy Alfalfa Chop for fattening cattle, sheep, hogs and poultry. Handles leaves, stems and all without waste or injuring color of the hay. Sell your No. 1 hay and mill off-grades for feeding. Make combination feeds from clover, rice straw, bean straw, pea vines, oats and rye, or dried cornstalks. Capacities 1200 to 2700 lbs. per hour. Recutting attachment on Junior Mill makes 500 to 800 pounds of meal per hour with 5 to 8 H. P. engine.

Powerfully built. Steel in castings. One-fourth heavier with a wonderful record for long service. Blue Ribbon Winner at Panama Pacific Exposition.

Send for illustrated FREE book and see how you can save labor and power cost and cut your feeding cost in half.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R. R.? Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet—Vacation—1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Northwestern Pacific R. R.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

DOG HAS TICKS.

To the Editor: My 6-months pup has woodticks which suck blood and swell up big as a grape.—T. B. D., San Francisco.

[A little coal oil applied to the ticks will cause them to release their hold. They breed in old wood and decaying vegetation of all kinds.]

PIGS COUGH.

To the Editor:—Month-old pigs have a bad cough.—Sub., Live Oak.

[Give these pigs 3 drops fluid extract belladonna 3 times a day. See that their surroundings are dry and sanitary.]

HEIFER TWIN STERILE.

To the Editor: Three weeks ago a cow had twin calves, a bull and a heifer. Will the heifer breed?—H. T. C., Campbell.

[This heifer is what is known as a "freemartin." Such a heifer twinned with a bull is almost certain to be sterile.]

MARE CANNOT GET UP.

To the Editor: Last February my 16-year mare became unable to get up when she was down. The veterinarian said it was kidney trouble. I changed feed from alfalfa hay to wheat hay with crushed barley. Her appetite is good, and she is sleek and fat. Gave her two doses of medicine which cost \$3, though the drug-store would put it up for 30 cents. Am 15 miles from a doctor.—A. A. K., Sanger, Fresno county.

[In this case follow the doctor's directions. Ask him for a prescription if you don't like the price he charged you for the drugs.]

TEAT STOPPED UP.

To the Editor: To get milk from a back teat of one of my cows, must insert a tube two inches, and then in a certain way. Sometimes blood comes with the milk.—H. P. S., Wasco.

[There is no drug or treatment which will give the effects you are after. An operation by a qualified man is the only remedy for the trouble.]

HENS STRAIN—BLOODY DROP-PINGS.

To the Editor: My best laying Leghorn hens are dying. Eggshells thin. I am now giving hard slaked lime and oyster shells. Feeding Sperry's Surelay reduced with one-third bran, wheat and Egyptian corn night and morning, a lot of sprouted barley and fresh skim-milk. Hens first have a soiled vent—seem to be straining all the time. Other hens notice the blood and nearly eat the affected hens alive if not removed. Many eggs streaked with blood.—T. H. H., Walnut Creek.

[Your trouble appears to be caused from a lack of lime salts for egg production. However, the blood mentioned leads the writer to suspect coccidial enteritis. A more complete description of symptoms and anatomical changes might lead to

discovery of the cause of your trouble.]

COLT NAVEL RUPTURE.

To the Editor: After I had lost two fine colts with navel rupture, I learned how to fix it, and cured two that I sold for \$500 when three and four years old.

Take a piece of leather or heavy canvas 6 or 8 inches wide and long enough to reach around the colt, put straps with buckles on it so it can be tightened or loosened. Take a round potato 3 inches or more in diameter, cut in half, fasten 1/2 of the potato to the canvas belt so the round side will fit over the rupture. It can be fastened to the belt by putting another piece of canvas around it and riveting it to the belt. Push the rupture in and fasten the belt around the colt with the potato over the rupture. To keep it from slipping back put a breast harness on the colt with straps and buckles to adjust it. Keep it on until well.

Sonora.

W. J. Davis.

CURING CALIFORNIA CHEESE.

To the Editor: In the issue of May 13 is an article about cheese-making by P. Domenigoni. We can make cheese, but do not know at what temperature to cure it, or how long it takes.—C. C., Brentwood.

[Answered by P. Domenigoni, Heber.]

[Keep the cheese at 65 to 70 degrees F. Must have no draft (in Imperial valley climate). It will take about a month to mature the California cheese and about two weeks for the Monterey kind. It must be turned upside down every day. If it leaks whey or water, it is because it was not cooked enough or not pressed tight enough. To cure the leaking cheese, it must be dried with a cloth twice a day. I have had 10 years' experience in cheese-making.]

MULBERRY LEAVES FOR STOCK FEEDING.

To the Editor: I have a large mulberry tree. The cattle, sheep, and hogs eat the leaves very readily as they fall, also green. Have they any feeding value?—Subscriber, Tuolumne County.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[Mulberry leaves are used to a limited extent for stock feeding in regions where there are large mulberry plantations which for some reason or other are not used for feeding the silkworm; for instance, in certain parts of Syria and Palestine. They are considered a valuable feed, especially for fattening sheep. The air-dried leaves contain, on the average, 12 per cent moisture, 16.3 per cent protein, 4.1 per cent fat, 49.6 per cent N-free extract, 6.9 per cent fiber, and 11 per cent ash. Chemical analyses showing the amounts of various groups of substances present in plant materials do not give any information as to the palatability of these; but when a feed is eaten readily by stock and analyzes high, it must possess a high feeding value, and practical feeding experience in foreign countries has shown this to hold true of mulberry leaves.]

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. PRINCE GELSCHE WALKER, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen; and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by KINTYRE LAIRD, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality the herd is unexcelled in the West.

At the head of the herd is BANKER'S BOY, junior champion and reserve grand champion at

Goats and Dogs in Tuolumne.

[Written for Pacific Rural Press by D. L. Schrader.]

When we were in Tuolumne county over three years ago, very few goats were being raised; but now, we notice that wherever a rancher has some rough pasture land covered with under brush, he generally has 20 to 100 goats. The Angora seems to be the most popular. Two of the requirements for successful goat raising are tight fence around the pasture and a well-trained dog. Ed Minners, who has a nice herd near Sonora, has trained two dogs very successfully. He has found the black shepherd the best breed.

Just after the pup is born and before his eyes are opened, he is taken away from his real mother and a nanny goat that has just kidded becomes his foster mother. Sometimes she objects very strenuously, and has to be thrown and held while the pup is allowed to get his first taste of goat milk. A comfortable box is fixed up in the corral where the goats sleep at night, and the kid and puppy sleep together. After a time the nanny adopts her foster son, and it is very interesting to see a beautiful kid on one side of the mother; and on the other, a little black-nosed pup. The pup grows up with the goats, and when they go out to pasture he goes with them.

It is particularly interesting to note the affection that the dog has for this adopted mother even after he has been weaned for months. He is ready to take her part in any scraps that she gets into; and if a coyote or other varmint appears, he is right there to put up an awful fight for his band.

The dog becomes inseparable from the band and will howl and mourn for days if taken away from them. As goats always come home at night, the dog has a chance to be fed well both night and morning. His feet are well looked after to see that no foxtails or bronco grass are allowed to cause them to fester.

One goat man told us that his dog was worth two men, as it was almost impossible to get a man to stay with stock. The dog keeps them together much better; and doesn't allow them to scatter off in different bunches.

SHEEP ON GRAIN FARM.

[Written for Pacific Rural Press.]

From a flock of 157 ewes and their lambs, N. L. Tomlinson of Stanislaus county marketed \$1,000 worth of wool and mutton two years ago, hav-

ing grown them largely on what would otherwise have been waste.

Mr. Tomlinson has a large acreage of grain land, through which laterals of the Turlock Irrigation District run. It is primarily to clean up the ditch banks that the sheep are kept.

During spring months the sheep are pastured on a small piece of alfalfa; and this is also headquarters for them at night during the balance of the year. Besides cleaning up the ditches they are pastured on grain stubble in summer and fall, taking care of themselves without a herder.

With this arrangement of feed the lambs mature rapidly, lambing usually being done in January though delayed till March this year. The local butchers always furnish an outlet for the lambs because Mr. Tomlinson has always kept good rams, mostly of the mutton breeds.

To begin with he had Merino ewes. These were bred to a Dorset buck, the ewes from this cross being bred back to a Merino buck. The next buck was a Shropshire and last year an Oxford Down buck shared honors with a Shropshire. Each buck is used on the flock two years. This cross-breeding has developed a fine band of ewes, it being Mr. Tomlinson's custom to select only the best ewe lambs for his breeding flock. While only a side line of his farming, sheep on this ranch are more than paying their way.

RESEARCH AND REMINISCENCE.

To the Editor: It is with much pleasure and interest that I have read your article in the "Pacific Rural Press" on "What Sheep Did for California." I had a more or less hazy notion of the sheep kept at the Missions and in early days, but your account of the matter, giving dates and other interesting facts, will be of great benefit to me in tracing the character of the forage which existed previous to that time and comparing it with the present condition of the ranges and pastures. Your study of agricultural conditions in early days makes your articles of great benefit to us newcomers who are trying to fathom the whys and wherefores of present conditions. Because of your long and broad experience in this state you are much better able to treat this subject interestingly than any one else.

P. B. Kennedy.

University of California.

[We are certainly very glad to interest Professor Kennedy. We get much pleasure from looking backward once in a while and in digging up things beyond our memory. That it may be useful is another and a higher consideration.—Eds.]

The cholera ordinance of Tulare county as passed last April provides for quarantine of sick or vaccinated hogs (if with virus) restraint of dogs, etc., where cholera exists, keeping quarantined hogs out of irrigation ditches or streams, cremation or burial of carcasses, and inspection and disinfection of all hogs imported to the county.

Cook in a cool Kitchen

All the heat is concentrated where it is needed—keeps you cool and makes for better cooking

NEW PERFECTION OIL COOK-STOVE

Why not cook with a modern oil stove this summer and be comfortable? Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate.

Better cooking because the long bluechimneys give steadier, more evenly distributed heat, under perfect control—like gas. No smoke or smell. In 1, 2, 3 and 4-burner sizes, ovens separate. Also cabinet models with Fireless Cooking Ovens.

LIMBERNECK AND OTHER TROUBLES.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

Limberneck is very largely a summer trouble, it is not a disease, but a symptom that must be recognized or the fowl will die. While the main cause of limberneck is ptomaine poisoning, I have known cases with all the symptoms of limberneck that came from sunstroke. One case especially was that of a pullet about 4 months old that had been accidentally shut out of her yard and had not sense enough to seek shelter from a blazing hot sun under nearby trees. I was away all afternoon and when I went to feed found this pullet at the gate with neck outstretched and as limber as possible. She got exactly the same treatment as though she had come by her trouble from poison except that she was held in a pan of cold water with the feet well covered while water as hot as could be borne was poured over her head. Then she was given a dose of medicine and put in a cool place. When morning came, she was scratching around as lively as ever.

But, the main cause of limberneck is poison caused by fowls eating decayed animal matter. It is usually supposed that if a fowl eats worms, bugs, and maggots that these things die immediately they are swallowed by the hen. This is not so, however, the hens' craw is just a hiding place for these things, it is warm and well supplied with moisture, air, and other requisites for continued life for certain things and if the maggots are old enough to contain poison as is the case when they come from decayed animals, the poison in them simply paralyzes the digestive tract in the fowl; and unless relief is soon given the fowls die.

To prevent limberneck then, all we have to do is to see that no dead or dying animals are left where fowls can have access to the remains. This is a big job when fowls are out on the range, but is easy when they are yarded. Still, on range it is in the rancher's power to keep track of everything except gophers and field

mice. There should be occasional days when the premises can be looked over for them. All dead animals should be buried deep, or better cremated, for no matter how deep they are buried, dogs will dig them up; and then the fowl are in danger. In cold or cool weather the danger from ptomaine poisoning is very little because the carcasses of animals do not decay rapidly enough to poison the maggots, so that even though a hen may eat numbers of them they would still be safe.

If a hen or several hens in a flock should be taken with limberneck it is well to put them in a pen by themselves, not because it is contagious, but because they are better kept on a very slim diet. Nothing at all except water is better, but anyway the feed must be easy of digestion.

For a bad case of limberneck give two teaspoonfuls of oil of turpentine and one teaspoonful of olive oil at one dose and no feed. Medicine, except just one dose, will do little good. What they need is to get the poison out of the system, and this is best accomplished by fasting.

For small chicks, give five to ten drops of the turpentine and oil according to age. If no turpentine is on hand give a pill made of lard, cayenne pepper, ginger or even mustard, anything that will act as a stimulant to hurry the condition away.

Broken Feathers.—My chickens look like they do in the fall when molting. The feathers are all split and broken. They are very dumpy, have almost stopped laying, and four have died. I feed wheat, green alfalfa, and onion tops, have not seen any lice. Mrs. H. P. A., Bieber.

[Your ration is too narrow, the feathers have no life in them because you do not feed any animal food to keep them wiry and elastic. Get them some beef scraps, fish meal, or some form of animal food, ground bone or anything you can; even a jack rabbit thrown to them after the good man has shot it, will be appreciated and used for feather making. All kinds of poultry are carnivorous and must have animal food; yet many treat them as vegetarians; and a few even as fruitarians, with the result that they lose money on their chickens.]

Chickens on Shares.—Would you please tell me what would be a fair lay out to give a person to raise chickens for you. I own the place. He is to board himself and chickens, I furnish housing for him and the chickens and range to run them on. What percent of chickens or income should I have?—A Subscriber, Oakdale.

[If I understand aright, the man owns the chickens, does all the work, furnishes all the feed, you simply furnish housing and bare range. You certainly cannot expect a large share, having nothing to lose. The land will be enriched by the poultry droppings and I should judge if you get ten per cent of the profit you would be all right, provided your range is bare. If it is alfalfa or any kind of green feed, you should be paid more. This kind of questions is hard to answer satisfactorily to all parties; and this is merely my own personal opinion so must not be considered as final.]

Fertility of Eggs.—How long after

a rooster is taken from the yards are the eggs fertile and how long before they are fertile after a rooster is put in with hens.

[I would not use eggs for hatching where the male had been more than two days away from them. While some of the eggs would be all right there would be quite a number of infertile ones. It depends on where the egg was when the male was removed and no one can tell these little things that happen in the passage of the egg from the place of starting until laid.

After putting a male into a yard it requires ten days for the eggs to be fertilized. I have tried them at all stages and found that a few would be fertile at eight days; but to make the hatch a success, ten days was required.]

Feather-Eating Ducks.—I have a pen of white Pekin ducks that have the habit of feather picking until their backs are bare. Do I put enough beef scrap in their feed or is it fresh meat they need? Is there something I can put on their back to break them of the habit? E. L. S.

[Feather picking can best be cured by turning the ducks out, or at least giving them more room. Mix black distillate and grease together and smear the bare places. That will help new feather growth and stop the picking. Put a teaspoonful of salt to one quart of water and give to drink just the one dose; no more for two weeks anyway.]

U. S. WOMAN WOULD USE LONDON PARKS FOR HENS.

London, May 25.—Give the hen a chance. With eggs at seven cents each, Mrs. Lionel Guest, daughter of the late John Bigelow, American

ambassador to Paris, is urging a plan here today to turn London's public parks into poultry farms. An enthusiast on poultry breeding, Mrs. Guest has started a crusade to give the hen a chance. She is telling the authorities that every public park should have its chicken farm with a woman expert in charge to show the public how to get the best out of biddy.

Green Park and St. James' Park, near Buckingham Palace; Hyde Park and other expanses of public green-sward have been selected by the American woman as the best locations upon which to try the poultry experiments.

Mrs. Guest declares she has proved her theories by successful poultry farming in Canada and emphasizes that British hens are equal to the task of providing sufficient eggs if enough people would become interested in hen culture.

She has expressed her willingness to keep poultry within the yards of her own house near the fashionable Marble Arch district, police regulations permitting.

Cleveland, May 25.—Mrs. S. T. Brixley put up an elaborate four-apartment bird house in her back yard in Euclid Heights a few weeks ago. She was puzzled when half a dozen or more birds loafed on the roof of the house but built no nests. She finally figured out the situation.

"While their wives were nesting elsewhere, the men birds have been using my birdhouse as a club," said Mrs. Brixley indignantly.

Self feeders for hogs are recommended by the University.

California Poultry Practice

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

FRESH EGGS STALE.

[Written for Pacific Rural Press by Geo. H. Croley.]

It is not such a very uncommon thing for hens to lay stale eggs, particularly if they are old hens and very fat. In that case many of them will retain the eggs in the egg sack for from 2 to 4 days after it is complete and, under ordinary circumstances, should be laid. The consequence is that the eggs have started to incubate.

There are a number of other reasons for classing absolutely fresh eggs as stale eggs; for instance, the careless use of disinfectants will sometimes taint the eggs and give them a stale flavor; sometimes they take up the odor from some certain nesting material, and sometimes it is caused by something that is eaten by the fowls. Your express agent may be careless and let the eggs stand all day in the sun, and then when they get shaken up on the cars they go to pieces.

RABBIT FEEDING AND EAR SCAB.

To the Editor: I would like to give you a slight call down on your extravagant method of fattening rabbits. In your issue of March 4, you recommend feeding oatmeal, which if followed would drive any rabbit raiser at the present prices of rabbit meat to the poor house. We are feeding between 3 and 4 hundred, and find that we get the best results for the least cash expended, in the following diet: Commencing at the cradle, we feed a doe with young a couple of handfuls of bran mash, just wet enough to hold together, and seasoned with condition powder, recommended by S. F. Streaner in a Sept. Press of last year. A slice of golden tankard beet, and hay complete the day's ration. The mash is fed in the morning. After the young are taken from the mother, we feed beets and hay until about three weeks before time to market them when corn is added to this diet—on the cob preferred. When fed that way about one large cob to 3 or 4 bunnies. If shelled, 6 or 7 lbs. to about 60 rabbits. Now if that won't make them fat, I'll eat them. We do feed some rolled barley by way of a change.

Also on your remedy for scab ear in this week's issue: 5 cents' worth of flour sulphur and a little sweet oil mixed very thin and poured into the ear will cure the worst case with two applications. Taken in the early stages will do the work over night. In either stage it will not be necessary to poke at it or sponge the ear out; the rabbit will attend to that part of it. J. F. Quant.

Sunnyvale.

No Pit

is required with the

Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

Chrysanthemums that were planted out in early May should have stakes by this time. Singles and pompons that you are growing for the sprays, should have a mulch 1 to 1½ inches thick, of rotted manure or manure that most of the heat has gone out of. Exhibition varieties, and those that you are growing to a single flower, will make a bud this month. It is called the "June bud." This will not make a flower. As soon as the bud forms, side shoots will start from every joint. These should be rubbed off. Toward the top of the plant, select one shoot to make your flower and cut the others off. The sooner you do this after the bud has formed, so much the better, as the plant then makes very little waste wood.

Carnations.—Your benches being filled, give them a good watering, and meanwhile give the plants that are intended for moving into the house, a thorough watering. These should have been planted out in March, and kept headed so no flower shoots form. If there are any flower buds when you start to move them into the house, cut them off. I select a cloudy or cool day to do my transplanting. The greenhouse is thoroughly shaded with whitening. I move any time from August to middle of September; but the earlier the better.

In digging the plants I try to get all the roots. I shake off all the soil, dip the roots in water and the tops in the lime sulphur fungicide to kill all red spider, and the spores of any of the fungus diseases to which the carnation is heir. In planting in the benches I spread the roots out carefully and do not plant deeper than they have been growing in the field. Stem rot is caused by too deep planting. As soon as I have planted six or eight rows, I let the water run on them slowly and thoroughly soak them, so water runs through the bench. After the house is all planted I do not give much ventilation, but spray the tops two or three times a day—to prevent evaporation in the foliage. I also wet all absorbent surfaces, walks, etc., to give out a moist atmosphere. In about two weeks the plants will have made new feeding roots, and started into growth. I then wash all shading from the glass and open the ventilators wide, both top and sides. Leave them open night and day, but continue spraying the plants for another week or two, wetting the soil as little as possible. This causes the plants to make more root growth. When they are well established, I give a 2½ inch potful of hydrated lime across a four-foot bench, this is scratched in and the soil leveled on the benches. I water when the plants dry a little. I give a 12½ inch potful of bone meal across a four foot bench, and at the same time put on about an inch of thoroughly rotted manure, the soil in the benches having settled about an inch. I do not disturb the surface soil after this, as the feeding roots run up into the mulch. After middle of October do not wet the foliage, for by so doing you are liable to start fungus growth.

GERMAN APPLE CAKE.

This appetizing and cheap form of bakery goods for tea-time use is made as follows: Sift one pint flour and 1½ teasp. baking powder and ½ teasp. salt together, rub 2 tablesp. butter into it and then add one beaten egg and enough milk to make a very thick batter. Spread this an inch thick on a greased pan. Have ready several peeled, cored and sliced apples, press the pieces into the batter to nearly cover the top; sprinkle thickly with sugar and a bit of powdered cinnamon, and dot with tiny lumps of butter. Bake this in a hot oven. Sliced peaches or apricots or any other kind of fruit may be used.

FRIED MUSH.

Have the corn meal well cooked, then pour into a square or brick shaped pan rinsed in cold water, or use cocoa cans. Let it stand at least ten hours, then cut in even slices. Beat one egg with two tablespoons of milk and dip each slice of mush in the egg, then into flour, making sure that the surface is well coated. Have the fat deep and smoking hot and fry in a basket not more than four slices at a time. Two minutes will be long enough for the cooking. Serve with maple sirup or honey.

MAKING TRAYS.

Old picture frames of wood, if not too large, can be utilized by making trays out of them. There will need to be a tolerably solid back of wood and on this should be pasted flannel or other soft goods, so that the tray will not scratch a polished surface. Under the glass can be used either gay cretonne, a pretty piece of silk or lace. Metal handles can be screwed to the ends to lift with.

POTATO CROQUETTES.

To a quart of cold mashed potatoes, add one egg, ½ cup milk, ½ cup flour, ½ teaspoon baking powder and a little salt. Mould into cakes and fry until they are a rich brown. The same recipe may be used for rice croquettes.

KITCHEN WALLS.

When the kitchen walls need freshening, have them painted instead of tinting, if you want a wall that will be durable and can be readily kept clean with soap and water.

An appetizing variety of sandwiches may be made from mixtures of shredded meat and chopped boiled egg, cheese and pimentos, nut meats and raisins, lettuce and salad dressing or egg and lettuce.

Use newspapers freely in the kitchen having a convenient place to keep them. Wipe out frying pans and any greasy tins with crumpled paper before dishwashing. Use newspaper for rubbing off the stove after a meal. Spread newspapers on kitchen table when cleaning silver or brass.

RICE WITH STRAWBERRY SAUCE.

Steam cook one cup rice until soft, using one-half water and one-half milk, and serve hot with strawberry sauce made in the following manner: Work one-half cup of butter until creamy, using a wooden spoon; then add gradually while beating constantly one and one-half cups powdered sugar. Wash and hull one quart strawberries, cut in halves, and let stand 15 minutes. Add to butter and sugar mixture and beat until well blended.

HOW TO SERVE LUNCHEON.

To the Editor: I wish to entertain a young lady, a friend of the family, at luncheon, and will serve chicken, mashed potatoes, peas, hot rolls, olives, fruit salad, salted nuts, and suet pudding, if you do not think that too heavy a dessert. Will you please give me directions as to setting the table and serving the meal?—Mrs. E. J. W., San Jose.

To have your table look well, put a good pad under the table cloth; the linen always looks nicer, when it is smoothed over it. In setting your table, place the knife to the right of the plate, with the spoons needed next to it—all an equal distance from the edge of the table. The fork, or forks, go to the left, with the prongs turned up. If you have plenty of silver put all that is necessary on at first; but if you have not, remove the forks and wash them between courses so that you have fresh silver for each course. The water glass which is filled just before the announcement of the meal, is placed above the knife; and the bread and butter plate opposite it on the left over the forks. The napkin, folded in a square, is placed to the right of the place.

As to butter, if you have never made butter balls, cut small neat squares of butter and place them on the bread and butter plate to obviate passing. Also place the roll, very hot, on the plate.

The olives, salted nuts and jelly may be put on the table then also. The jelly to be passed with the chicken, the olives and nuts saved for the salad course; that is, in regard to the nuts if you are not going to use the little colored paper cups which are used to help to carry out the color scheme for decoration; passing them with the salad, however, is perfectly correct.

Broiled chicken is usually served a half to each person; and if that is your plan, serve that course of chicken, mashed potatoes and green peas on a plate hot from the kitchen. The gravy can be passed, and the jelly also, with this course.

As to salad, I would certainly serve it in a separate course, as one's dishes get disarranged and the table looks "cluttered" when too much is on it at one time. A fruit salad would be delicious, but have it dainty, crisp, and cold. Crackers (dainty chips they are called) which are long and narrow are flakier, saltier, and daintier; and if a little grated cheese were melted on them, would make even nicer. The olives and salted nuts come with this course.

For your dessert, I would choose the suet pudding, if you especially excel in the making of it, for that will make your luncheon seem individual; and as this is a family affair, I would let the personal element come into it. It would be nice for you to serve the dessert at the table, and also the coffee then. You said nothing about coffee, but if you were to serve it with the meal, this is the place for it. The fashionable way of course, is to serve small cups of black coffee after the dessert. The lump sugar and cream could be placed when the table is set, before your plate and remain there during the meal so that you would not have

ARTISTIC VASES.

Simple designs in bowls and vases are much more artistic and also at present much better style than the more ornate designs. A simple crystal vase, to be used for one perfect blossom makes a much more beautiful and natural looking bouquet than a combination of many varieties of flowers that are not harmonious in colorings. Baskets in brown colorings are wonderfully beautiful for many flowers—some of these baskets have a tin lining that will hold water. If not, a tin can of the right height will serve to keep the flowers fresh.

WASHING RAG RUGS.

Rag rugs grow dusty and soiled looking after use and if they are not greasy, a good and easy way to freshen them is to spread them on a lawn, wet thoroughly and scrub them with a broom. Keep using plenty of water and then hang on the line and let drip dry. If they are greasy, you will need warm water and soap and a good scrubbing brush, but there is more danger of the colors running then.

TEACHING HOME PURSUITS.

This is a rapidly progressive age. One sign of it is the new attention being given to vital subjects in the schools.

In New York, for instance, teachers are being taught everything from the care of infants to the feeding of husbands.

This is so that the teachers will have a broader knowledge to apply during the instruction of the juveniles in their charge; will be able to pass along to them such facts and suggestions as may seem advisable for them to learn during their school life.

"Well, George, are you perfectly satisfied?" asked his uncle, after the Christmas party was over. "No, uncle, I ain't," was the plaintive reply. "Bless my soul, how's that?" "Why," replied George, "auntie told me to eat as much as I wanted, and I couldn't."

Saucepans that have been burned can be cleansed by boiling a solution of lye in them for a few minutes.

to think of it. You know that it is a cool, calm, and collected hostess rather than the food which makes any dinner or luncheon party a success. And your guest will enjoy talking to you more, I am sure, than she will to see you get up for forgotten things.

After this generous luncheon, fruit really is not necessary; but a prettily arranged basket or glass dish of assorted fruits would be nice, placed on the table with the dessert.

ROSABELLA BEST.

THE GOLDFINCHES' NEST. (A True Story.)

The goldfinches had built in one of the young castor bean bushes, on a swaying branch; and the children had taken almost as great an interest in the nest as the birds themselves. Day by day they watched it and when the four tiny bluish white eggs hatched into little clamoring birds their delight knew no bounds. Even Ruth, who was fourteen and a freshman at high school, spent hours watching the nest. Billy and Betty, the nine-year-old twins, were full of speculations as to the fate of the little nestlings. The parent birds soon became accustomed to being watched. They flew back and forth attending to the wants of their family, with slight regard for curious eyes.

The nest seemed out of the reach of cats and everything looked promising, until one day a dreadful thing happened. A strong wind blew the nest to the ground. After a careful search the children found all four nestlings, still alive, but looking very limp and forlorn.

Ruth ran to her room and soon came back with a small basket. In this the nest was placed and it was carefully tied to the branch. The little birds were put into the nest again and then the children waited to see whether the parents would come back. But all afternoon there was no sign of them. Ruth could not help crying when she was alone in her room and that night she put a black mark in her diary under that day.

The next morning the children were busy working in the garden, when they heard a great deal of noise from the direction of the nest. Surely such a sound could only come from young birds being fed, and when they hurried to the place, the children found that the parent birds had really come back.

The young birds grew very fast after that and it was not many weeks before the last one flew away, but Ruth kept for a long time the basket with the little cup-shaped nest.—Olive Day Thacher.

To keep the Dover egg beater in good condition, do not put to soak after using. Rinse immediately and dry quickly.

Keep a pair of kitchen scissors on hand. They are fine for shredding lettuce, preparing grape fruit and so forth.

Kill All Flies! THEY SPREAD DISEASE

Placed anywhere, DAISY FLY KILLER attracts and kills all flies. Nest, clean, ornamental, convenient, and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Ask for

ABBIE BEN ADAMS.

Abbie Ben Adams, may her life be spared,
Awoke one night, and felt a trifle scared;
For on her shirt-waist box, cross-legged, sate
A Vision writing on a little slate.
Exceeding nervousness made Abbie quake,
And to the Vision timidly she spake.
"What writest thou?" The Vision looked appalled
At her presumption, and quite coldly drawled,
The list of our best people who depart
For watering places sumptuous and smart."
"And am I in it?" asked Miss Abbie.
"No,"
The scornful Vision said. "You're poor, you know."
"I know," said Abbie; "I go where it's cheap:
I can't afford mountains or prices steep,
But, ere you leave, just jot this item down,
I never leave my cats to starve in town."
The Vision wrote and vanished. Next night late,
He came again, and brought his little slate,
And showed the names of people really best,
And, lo! Miss Abbie's name led all the rest!

—Carolyn Wells, in Life.

SOFTENING HARD WATER.

To the Editor: I saw in your June 10 issue where some one wanted to know how to soften water. I have found a washing powder that is fine, and does not fade the clothes unless they are the fadey kind. It is called Hippo Washing Powder. It does not hurt the hands and you can use any kind of soap with it. I use Fels Naphtha—have good luck with it; makes the dirt roll out.—Subscriber.

[In softening water for spraying purposes, E. Ralph de Ong of the University Farm School, writing in the monthly bulletin of the State Commission of Horticulture, says that hardness of water may be either "temporary" or "permanent." The former is generally caused by bicarbonate of lime and may be settled by boiling the water or adding quicklime. "Permanent" hardness is due to other mineral salts, and must be treated with some chemical which will unite with the minerals in the water and cause them to settle. Ordinary lye, or sal soda, should be tried. If they fail, add one to three pounds fish oil soap per 50 gallons of water. This unites with the lime, magnesia, and many other salts found in the water, to form an insoluble soap, which may be skimmed off. If this fails, try potash soap. With alkali water use soda ash phosphate.]

After Old Mose had been given a job, says the Lippincott's Magazine, the foreman saw him comfortably on the sand he was to shovel, directing another dusky laborer. "Why, Mose," he exclaimed, "I did not hire that man. What's he doing here?" "I got him er-doing my wuk, sah," replied Mose. "Who pays him?" "I does, sah; I pays him a dollah a day, sah." "Why, that's all you receive, Mose. How do you profit by the transaction?" asked the amazed foreman. "Well," replied Mose, "I gets to boss de job, doan' I?"

A little boy six years old was boasting that he worked in a blacksmith shop. "What do you do there?" he was asked. "Do you shoe horses?" "No, sir!" he answered promptly. "I shoo flies."

Ready for the fair.

Every activity on the farm is worth a

KODAK RECORD

The growth of stock and crops, the condition of orchards and buildings, the things you see at the fair, at the farmer's institute—the Kodak can help you get value received from every one of them.

And its capacity for increasing your enjoyment of your auto trips and other outings is equal to its value in a business way.

Ask your dealer or write us for our illustrated booklet, "Kodak on the Farm." It's free.

Established 1867 Louisville, Ky.

San Francisco, June 28, 1916.

WHEAT.

Offerings of new crop wheat still scarce, and business quiet here, with no strong buying interest. Prices rather easy, and a decline on northern grades expected.

Northern Club\$1.70 @ 1.72½
Calif. Club, ctl. Nominal
Northern Bluestem. 1.82½ @ 1.85
Northern Red 1.80 @ 1.90

BARLEY.

Quite a lively demand for future barley this week, and this is partly responsible for a stronger feeling in the spot grain, though a more direct cause is a heavy rail movement to the East, which helps somewhat to relieve the shortage of ocean shipping facilities.

Shipping, ctl.\$1.35 @ 1.37½
Choice Feed, ctl. 1.30 @ 1.32½

OATS.

Little new stock has come in so far, and with old grain getting scarce, red feed has been marked up a little. Good cleaned stock is held at even higher figures, but little is moving.

Red Feed\$1.40 @ 1.45
White 1.50 @ 1.60

CORN.

Eastern is steady at the recent advance, but there is no great movement here, most of the stock coming in on orders from milling interests. Egyptian, etc., find about the normal demand in outside markets, with only limited trading locally.

Eastern Yellow, ctl.\$1.85 @ 1.87½
Milo Maize 1.40 @ 1.45
Egyptian 1.45 @ 1.50

BEANS.

Beans have this week made the most sensational advance in a long time, everything on the list being marked up sharply. The sudden advance is attributed to a heavy buying movement in the border states, owing to the Mexican situation; as the East and Middle West have been taking only about the normal amounts. Offerings, however, were light, and most varieties are now in very scant supply, with holders anxious to conserve stocks for their regular trade. Small whites are now held as high as \$11, and all white beans are far above all former records, with practically nothing on hand. Bayos and Pinks also have made a remarkable advance, and limas are very strong, with a close cleanup expected. Horse beans are practically nominal, with old stock all gone, while blackeyes are still in fair supply. The acreage in white beans is said to be larger than last year.

(On wharf, San Francisco.)

Bayos, per ctl.\$6.25 @ 6.50
Blackeyes 3.25 @ 3.40
Cranberry Beans 6.00 @ 6.20
Horse Beans 3.25 @ 3.40
Small Whites (south) 9.75 @ 11.00
Large Whites 9.25 @ 9.50
Pinks 6.96 @ 7.25
Limas (south) 6.50 @ 6.75
Red Kidney 8.00 @
Mexican Reds 5.50 @ 5.60
Tepary Beans 4.50 @ 4.75

HAY.

No. 1 and medium grades of the new crop hay are now coming in freely, but the arrivals have not been very greatly in excess of current needs, and prices are well sustained throughout the list, all offerings being readily disposed of. Fancy red oat hay is especially strong, but is expected to decline as more is offered. The larger dealers here state that they are buying little for future requirements, feeling that the future tendency of prices is likely to be downward rather than upward. The amount of grain acreage cut for hay is said to be above early estimates, which will materially increase the tonnage. Export trade is rather light, and coastwise shipments are tied up by the water front strike. Alfalfa is in strong demand, and is quickly bought up, though arrivals are increasing.

Wheat, No. 1\$12.00 @ 13.50

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, June 26, 1916.

There is practically no change in the Eastern situation and the demand continues active on all varieties. There has been an occasional slump on peaches due to unseasonable weather.

Eastern states are now shipping peaches—Alabama, Georgia, Oklahoma, Texas—but in no section is the crop heavy.

Estimates of shipments of Georgia peaches for the season are as follows: For the week ending June 24, 100 cars; July 1, 300 cars; July 8, 650 cars; July 15, 900 cars; July 22, 1000 cars; July 29, 300 cars; and light shipments the fore part of August.

The following prices have ruled for the week:

New York. — Royals averaged

No. 2 9.00 @ 11.50
Tame Oats 11.00 @ 14.00
Wild Oats 10.00 @ 12.00
Barley 10.50 @ 12.50
Alfalfa 10.00 @ 13.50
Stock Hay 10.00 @ 13.00
Straw, per bale25 @ .40

FEEDSTUFFS.

There is nothing new in feed prices, the consuming demand being fairly active for this time of year, though the local movement is of no exceptional volume.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton ..\$22.50 @ 23.50
Alfalfa Meal, per ton. 17.50 @ 20.00
Alfalfa Molasses Meal, per ton Nominal
Bran, per ton 28.00 @ 29.00
Oil Cake Nominal
Cocoanut Cake or Meal 23.00 @ 25.00
Cracked Corn 40.50 @ 41.50
Middlings 35.00 @ 36.00
Rolled Barley 28.00 @ 29.00
Tankage 45.00
Rolled Oats 29.00 @ 30.00

VEGETABLES.

Numerous lines of summer vegetables are now coming into the market in large quantity, causing a general easing of prices, though on the whole values are fairly high for this time of year. Cucumbers have dropped again, and further weakening is expected. String beans hold steady, and choice peas are well maintained, though off lots are cheap. Summer squash, eggplant and bell peppers are all lower, and tomatoes are rapidly getting down to the midsummer level, though offerings are not yet over-large. Rhubarb is about gone, while asparagus is in liberal supply. Green corn has dropped sharply, with rather large arrivals of fancy stock.

Cucumbers, lugs75 @ \$1.00
String Beans, lb 4 @ 7 c
Summer Squash, lugs... .90 @ 1.00
Peppers, bell, lb 8 @ 10 c
Asparagus, box 1.25 @ 2.00

Peas, lb. 2½ @ 4 c
Tomatoes, crate 30 @ 60 c
Green Corn, sack 1.25 @ 2.50
Okra, lb. 5 @ 7 c

\$1.64; Tragedy plums. \$1.73; Formosa, \$1.66; Climax, \$1.55; Santa Rosa, \$1.65; Burbank, \$1.36; Clyman, \$1.10; Abundance, \$1.27; Triumph peaches, 94c; Wilder pears, \$1.98; R. Anne cherries, \$2.05.

Chicago.—Climax plums, averaged \$1.22; Tragedy, \$1.52; Burbank, \$1.22; Santa Rosa, \$1.62; Formosa, \$1.48; Royal cots, \$1.55; Triumph peaches, 75c; Hale, 62c; Alexander, 62c; H. B. Comet pears, \$1.50.

Boston.—Climax plums, \$1.37; Tragedy, \$1.80; Burbank, \$1.30; Formosa, \$1.42; Santa Rosa, \$1.30; Abundance, \$1.32; Clyman, \$1.18; Triumph peaches, \$1.10; Alexander, 97c; Royal cots, \$1.25; H. B. Wilder pears, \$1.45.

[Total shipments to June 27, 1675 cars as against 1096 to same date 1915.]

POTATOES AND ONIONS.

Everything in this line is quite firm. Oregon potatoes are about out, and new local stock is in some demand for shipment, besides being in rather light supply. Prices show a wide range, fancy upland stock from Los Angeles doing best, while off-grade River stock is easy. Some of the local dealers say the crop is very short, partly due to the frost, but more to a reduction of Delta acreage. This they attribute to the system of absentee ownership and farming by Oriental labor on shares, under which much of the Delta potato land has been ruined; and say there is need of a reliable class of growers, who will work on scientific principles and make a fight on diseases.

Onions are still very strong, with a demand for shipment both north and south, and high prices are paid without distinction of grade or variety, growers getting \$2.15 to \$2.35 on the bank. The crop is unusually late, and prices are expected to get down to normal within the next month.

New Potatoes, ctl.\$1.45 @ 2.25
Onions, red 2.25 @ 2.50
Yellow 2.25 @ 2.50
Garlic, new crop, per lb .. 6 @ 7c

POULTRY.

Young stock continues to arrive in excessive quantities from nearby egg districts, with a good many carloads from the East, and values continue easy. Fryers have been shaded a little, other lines standing as before.

Broilers, 18 lbs. to doz. and less, lb. 20 @ 21c
do, over 18 lbs. to doz. .21 @ 23c
Fryers 23 @ 27c

DECIDUOUS FRUITS.

Most lines of berries show a further decline, fancy strawberries, raspberries, blackberries, and currants all being in liberal supply at easy figures, while logans are slightly firmer. New apples are more plentiful and the old stock will soon be crowded out. Pears are, still scarce, but the quality does not warrant any fancy prices. Offerings of cherries are limited to Oregon stock, which is firm; while apricots are easy, with plenty of good stock arriving in lugs. Values, however, are held pretty well up to the quoted range, with nothing given away. Peaches are lower, and a good deal of cheap stock is appearing in lugs and baskets. Black figs are weak, with heavy supplies. Most lines of plums are lower, though some fancy stock still brings high prices. Cantaloupes are rather firm, and watermelons have not yet gotten down to the midsummer level. Grape offerings are limited to Thompsons, which are easier.

Currants, chest \$3.00 @ 4.00
Loganberries, chest 2.00 @ 3.00
Gooseberries, lb 3 @ 6 c
Blackberries, chest 3.50 @ 4.00

Grapes, Thompson, crate 1.00 @ 1.25

DRIED FRUITS.

The only new feature of much interest is the establishment of a firm figure of 6c for new crop peaches. Large contracts on this basis have been made at Vacaville, Fresno, and other places, and there seems to be nothing obtainable under this figure. Old peaches are about cleaned up, and a good many are said to have been bought at over 5c. The trade no longer shows any reluctance in taking hold of the new crop, and a considerable tonnage has already been moved. Apricots are extremely firm, and offers of the top price quoted have brought out only a limited amount of fruit, as much of the crop is being used for canning and shipping, and holders of dried fruit feel warranted in keeping off the market for the present. Packers are still not inclined to meet the growers' figure of 6c for new prunes; and business in this line is slow,

Special Livestock Market Report.

Cattle.—The week may be characterized as one of the poorest ever encountered by killers so far as outlet is concerned; and this naturally reacts on prices in the country. The whole situation may be summarized by the statement, "plenty of cattle offered but little buying."

Sheep.—There is very little activity in sheep, largely due to high prices which are restricting consumption. A few choice Nevada lambs were received during the week, but otherwise few lambs have arrived.

Hogs.—Limited quantities are arriving and those of poor quality.

This is giving packers a chance to clear their storerooms of last spring's pack. No large receipts are now expected till the stubble hogs appear in the fall. The biggest announcement for the week is that two packing houses are to be built at once in Idaho and Utah to consume the Idaho hog supply. Offices will be opened in Los Angeles and San Francisco in an attempt to market the finished product. If successful this move means the elimination of the Idaho live hog in California markets.

Wool.—There is a lack of activity locally, quotations remaining the same as last week.

though there is some buying to take care of early requirements. Figs are as firm as ever, with California practically the only source of supply. The Associated Raisin Company has named export prices, 10 per cent above last year, and new figures on seedless are expected shortly.

Apples, old crop	5 1/2 @ 6 c
Apricots, per lb., 1916	12 1/2 @ 13 1/2 c
Figs, white, 1916	6 1/2 @ 6 3/4 c

CITRUS FRUITS.

On June 26 Valencias, with 35 cars sold, were lower in New York, averaging \$2.80 to \$4.60; lemons averaging \$2.15 to \$3.85. In Boston, 16 cars Valencias averaged \$3.55 to \$4.15 and lemons \$3.25 to \$4. In St. Louis 9 cars sold at \$2.05 to \$3.70 average for Valencias and \$2.65 to \$3.60 for lemons. This season 28,580 cars of oranges and 4,772 of lemons have been shipped from Southern California to June 26.

In San Francisco navel oranges are now all cleaned up, and Valencias are in fair demand for this season, fancy stock bringing a slight advance. Grapefruit and lemons are moving well, and the top figures in both lines are higher.

Oranges, Valencias, ...	\$2.75 @ 3.25
Grapefruit	1.50 @ 2.75
Lemons, box	1.75 @ 4.50
Lemonettes, box	1.50 @ 2.00

HONEY.

So far the new crop has been extremely light, and while the most pressing trade needs locally have been supplied, there is still quite an active demand. New comb is coming in fairly well, but water white extracted has been practically cleaned up for several days, and a small lot just arrived is held at 9c, none having been sold as yet.

"THE FARM MORTGAGE."

Like most city real estate owners, farm owners operate their properties on a mortgage basis either to finance the purchase of more land, or to pay for improvements and developments that may be expected to pay more than interest on cost.

But unlike the owner of city real estate the country borrower, through lack of established facilities, has had to pay excessive rates of interest for his loans.

After a thorough study of conditions affecting the security of farm mortgage loans, I have convinced some of the large financial interests of San Francisco that to put their funds into loans to farmers at fair rates is the safest kind of an investment.

I am now prepared to receive applications for loans of any amount on good money-making farms and ranches. While there is over a million dollars available at this time, the small loans will be considered as carefully as the large ones.

Send full detailed description of the property and the loan wanted.

HORSES.

The principal feature at present is buying for the U. S. Army, bids having been taken Monday for 26,550 mature cavalry horses, 15,900 mature artillery horses, 192 light drafters, 8,100 each lead and wheel mules, and 4,000 pack mules. It is expected that California will furnish less than 10,000 of the animals wanted. In the local bidding, the cavalry horses were offered at about \$180; pack mules at \$140, lead at \$175, and wheel mules at \$200. With this inquiry on top of the recent European buying, horses are getting very scarce all over the country; though some stock that will not classify for army use is rather slow of sale, the local demand being light. It is predicted in some quarters that the horse market will be strong for a long time, owing to the need for farm stock in Europe after the war.

HORSES.

Publisher's Department

The demand for our newest book "Second Thousand Answered Questions in California Agriculture" continues brisk as ever. Have you sent for a copy? Ask for the special offer we make (to subscribers only) on this useful book of reference.

During the past week, as is our custom at this season, we have switched our subscription men from the valleys to the mountain and coast sections. Naturally some time was lost making the changes and our gain for the week dropped to 147 new subscribers; but with invigorating sea breezes and refreshing mountain air, we shall not be surprised to see them make up the shortage within a few days.

A hyperimmune serum to stop progress of blackleg has been perfected by the Kansas State Agricultural College.

AVOCADO TREES for sale, fine field-grown budded or Budded Avocados. Newberry-Sherlock, E. F. D. 2, Pasadena, Calif.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

WANTED.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. K. Humphrey, Principal, Stockton, Cal., Box 704.

SITUATION WANTED ON FARM by married man with family. Qualified by experience to handle almost any kind of place. The man you are looking for if you need a competent and dependable superintendent. Address Box 34, Santa Fe, New Mexico.

WANTED—Superintendent to take charge of farming operations on large ranch in Oregon. Address, stating age, if married, size of family, experience, references, and salary commanded heretofore. Pacific Rural Press, Box 1.

WANTED—Experienced man and helper to care for 40-cow dairy. Milk with machines; make some butter; must give good reference. Box 220, Pacific Rural Press.

YOUNG MAN, well educated, wishes position on farm to learn practical farm work. Box 217, Pacific Rural Press.

LAND FOR SALE

COLVILLE INDIAN RESERVATION, WASHINGTON, OPEN FOR SETTLEMENT—Drawing July 27th. About 500,000 acres. Fruit, Farm and Dairy land. Complete Sectional Map and Description. Postpaid, \$1.00. Soldiers, sailors (or their widows) of the Civil or Spanish Wars may register by Agent. Write us for blank forms, which we will furnish free. SMITH & McCREA, Room 108, Eagle Bldg., Spokane, Wash.

STATE LAND NOW coming on market for first time. Lists any three counties and services until 1917, \$5. COUNTY Sectional MAPS showing GOVERNMENT Land. \$2.50 ANY County. STATE Map showing 600,000 acres SCHOOL Land, \$2.50. June Booklet, FREE. JOSEPH CLARK, Sacramento.

SUPERINTENDENT soon open for engagement. Very large farm or orchard preferred. Practical and technical. Years of experience. Shaping up new or run-down propositions a specialty. Address Box 222, Pacific Rural Press.

FOR SALE—120 acres bean and alfalfa ranch near Shafter, Kern county. Good buildings. Irrigation plant, orchard and vineyard. Price, \$15,000. Wm. S. Fay, Shafter, Cal.

FOR SALE—By owner, good fruit ranch in Happy Valley, Shasta county. Healthy climate. Good market. Address Wm. De La Rosa, R. 1, Box 65A, Redding, Cal.

FOR SALE—Relinquishment Coachella Valley; cleared, level soil, no alkali. Dates, figs, olives, almonds, grapefruit. Early gardening. Box 57, Palm Springs, Cal.

WANTED to hear from owner of good ranch for sale. State cash price and description. D. F. Bush, Minneapolis, Minn.

The Price of **FISK** Non-Skids Is Less

Than the Plain Tread Styles of
Several Other Standard Makes.

NO tires will give you greater mileage returns or make your tire money go farther. Put them on all four wheels—that's the ideal tire equipment for road conditions as you find them.

The Fisk Tire Service Policy (for the benefit of motorists and 35,000 Fisk dealers) is absolutely without comparison—125 Direct Fisk Branches throughout the country.

THE Fisk Tire Service Policy is most liberal and complete. The 125 Direct Branches cover the entire country and make Fisk Service quickly available to our dealers, and to you. Through your dealer you are sure of the promptest attention of the Fisk Branch in your vicinity—and if you are handy to that branch, you can make use of **Fisk FREE Service** to motorists **whether you use Fisk Tires or not.** Dismounting, inspection, inflation, re-assembling, inspecting wheels for alignment and so on, all Free. No charge made except for actual repairs and supplies. No tire service policy means so much to tire users—or is so easily accessible.

Improving Rural School Conditions.

What Organized Effort on the Part of Farmers in Napa County Has Done Toward Improving the Rural School and How it Came About.

[Written for Pacific Rural Press.]

THE rural school as seen in most of the older settled agricultural communities is the acme of standpatism in educational matters and, strange to say, is one of the last of the farmer's problems to receive recognition by the progressive farming interests.

Anyone at all familiar with farm life, is acquainted with the country school. It has lost none of its individuality since it first became popular in song and story; and, except for a more antiquated appearance, inside and out, it presents the unpleasing architecture of 30 years or more ago.

Of the 51 school districts in Napa county, 48 are essentially rural and consequently filled the above description for a number of years. Two years ago they were no better or worse than the average in the State. Now they are better than the average and the work has only commenced.

Parents Dissatisfied.—It all came about through the monthly meetings of the various Farm Centers in the county. Before the establishment of the Napa County Farm Bureau, Napa county parents had a vague idea of conditions at their district school. "As soon as parents become acquainted with conditions they demand better ones," says Farm Advisor H. J. Baade. And the Farm Center meeting each month impressed the parent with the poorly equipped school house. In other words, familiarity soon bred contempt; and contempt demanded improvements.

Because of this the County Farm Bureau appointed an Educational Committee in November, 1914, to investigate all of the rural schools in the county in regard to equipment, light, sanitary conditions, etc.

This committee made their first report April 10, 1915, stating that conditions were worse than had been anticipated. Later this committee reported that the sanitary conditions were very poor, that most of the school houses had cross light (windows on both sides of the room) and that but very few districts provided fresh drinking water.

Through the efforts of the committee, a meeting was held in May consisting of the County Superintendent of Schools, the clerk of each board of school trustees and the school trustees and teachers in the northern part of the county.

At this meeting an organization was perfected to take up the financial problems and to devise a Standard School score card for the county, in order that each school might know how it stood in the matter of sanitation, lights, general appearance, etc.

Condition of Schools.—After two months' work of the enlarged organization, a joint meeting of the Napa County Board of Education, representative of the Napa County Farm Bureau, and School Trustees was held.

At that time, the original Educational Committee reported that but two schools in the county had modern drinking fountains; that of the 51 schools, there were 22 where the water was either unfit or no water at all on the school premises, necessitating the carrying of water from adjacent farms; that with but seven exceptions every rural school house had cross lights; that the outbuildings were a disgrace to the community in a majority of cases; and that school buildings were in bad condition as well as the grounds.

This enlightening report brought results. Besides outlining the qualifications of a "Standard" or "All Star" school, as given on another page, a method of securing the necessary funds was evolved.

Those with experience in securing funds for rural school improvement will appreciate this feature of Napa county's school story, for the financial problem is always an important one.

Getting the Money.—In this case the suggestion came from the County Superintendent of Schools, who recommended that an application be made by trustees of the various school districts, to the County Superintendent for funds, secured by special tax in the districts to be benefitted (in excess of moneys derived from State and county funds); an estimate

of the required amount being submitted, in accordance with Section 1840 of the Political Code of California. This application also requested the County Superintendent to approve this estimate and submit it to the Board of Supervisors, who in turn would levy a special tax in the districts benefiting.

This took the improvement of rural schools largely out of the hands of the taxpayers, it is true, for it did not allow public voting as to whether the tax would be raised or not. But this proved a decided advantage, as it made improvement possible in face of the taxpayer who

is always opposed to additional taxation. The net result of this joint meeting was the filing of 22 applications by as many districts for a total sum of \$17,741.50. These were granted by the supervisors and raised by special tax.

The uses to which this money was put were various, each school spending the money on the features deemed most necessary. This naturally called for various sized funds. One district that spent \$850, used it for the following purposes: Pump house and tank, motor and pump, two toilets, septic tank, pipe and plumbing, shed for horses, heating appliances, changing lights, houses for toilets, flag and pole, and painting, inside and out.

Spending Wisely.—That this money might be wisely spent, score cards of what was considered a "Standard School" were printed and hung in each school room, thus acquainting parents and children, as well as the trustees, with the qualities of a model school.

To create rivalry and at the same time show what each school was lacking, the County Superintendent pasted small gold stars opposite all requirements as fast as each one was complied with. Thus the schools have come to be known as "Star" schools, the rating being based on the number of stars secured.

(Continued on page 31.)

THE WEEK.

BOTH Uncle Sam and the bad small boy who has been twiddling his thumb over the south fence seems to be getting to a better understanding of each other, and it may be that a diplomatic spanking will be all that settlement will require. Carranza seems to be most anxious to save his face: it does not seem to matter so much to him what happens elsewhere. If it does stop short of war the experience of the last two weeks will be roundly profitable as a maneuver, for it will show what we could do in massing troops, munitions, and supplies in a moment, if a real occasion should arise. It will give to those who attend to such matters very concrete suggestions as to what we need to do to be safe. It also furnishes some practical demonstration of what those goodly persons, the professional peace-makers, can be expected to accomplish when mankind gets its mad up. The peace-maker seems really to be situated as was the neighbor who interfered when a man was trying to beat his wife—and we are glad they are a thousand miles away from the border. We would grieve to lose our peace idols, even though they are chiefly gilt on wood. We shall be very glad to learn all we can about war, without getting into it, and that seems to be the present prospect.

And there is another good line of consolation—or of warning against being over-scared before we are hurt. Just run over present indications of activity in fruit shipping and preservation and prices which are being paid, and then remember all the sobs which were sobbed by commercial fruit shippers last winter when they saw an abundance of embargoes and such a scarcity of ships that they thought fruit could not possibly be worth picking up from the ground this summer! And now they are running around paying almost as much per ton for fresh fruit as they feared they could not afford to pay for dried! But those whose business it is to buy are not to be blamed. If anyone is to be blamed it is the one who is scared into selling before there is any crop to sell and before anyone can tell what the warrant is to be for buying.

WHAT WILL THE EMBARGOES DO?

WE DOUBT if there is any real reason to be scared by embargoes. If the war goes on, as now seems most unlikely, it must be remembered that embargoes do not apply to supplies needed for the armies. They must have dried and canned fruits and we imagine this fact has something to do with the enlargement of buyers' views and the splendid activity of their establishments. And that seems perfectly safe, for if peace stops the war demand, it will also open ports to supply millions of famishing people who have been on short rations for months, and even years, and any hungry man can realize what such people will do. Fear is also expressed lest certain exclusive trade policies talked of by France and England, after the war,

should operate against our products. Such discussions may be well enough to keep non-combatants thinking they are doing something patriotic, and after the war people will do what they like, and more of it because they have been so long under restraint. Our Canadian cousins are getting some consolation from the hope that some special privilege will give them a better market for fruit jams such as they can produce. We hope it will be so, but they should remember that jam will not satisfy everyone. We read the other day that George is not content unless Mary sets out canned peaches from Sutter county, California! George is right: he is full of practical statesmanship.

RURAL CREDIT ARRIVES.

ALTHOUGH there were interesting utterances on the subject earlier, six years ago formal discussion of organized rural credit, as a lending method different from all lending methods hitherto prevailing in this country, began with an address before the Ohio Bankers' Association by Myron T. Herrick in 1910. Four years ago (in April 1912) David Lubin proposed to the Southern Commercial Congress that about a hundred special students, appointed by the general and state governments, should make a long tour of study and observation of rural credit in European countries, and this was accomplished in 1913. Four years ago (in June, 1912) the conventions for presidential nominations of republican, democratic and progressive parties placed demands for rural credit provisions in their national platforms. Three years ago (in July, 1913) the students sent abroad for rural credit investigation returned and presented their report, which was published by Congress. Two and a half years ago credit by congressional enactment began to appear in both houses of congress and it is said that something like sixty such bills were introduced and committees of both Senate and House began formal consideration of the subject. One and a half years ago (Feb. 16, 1914) the committees of both houses in joint session began to hold hearings and recorded 964 printed pages of testimony which was printed by the government. Last year (1915) the committees boiled down the bills referred to them into substitute bills of their own and favorably reported them. Later in the year these bills were considered in joint committee and after months of debate they reported a new bill during the early months of 1916. As the bill of the joint committee underwent amendment in both houses, it became necessary to consider these amendments in conference committee and agreement was reached so that the same bill passed both houses and was sent to the President last month. Now the announcement comes that the President will sign the bill and soon make the federal appointments which are provided to make it operative.

HOW IS THE NEW CREDIT TO WORK?

THERE is so much variation in the outlines of the new law which come to us that we are not at the moment sure of its specific provisions and must wait a little until we receive an authoritative copy. This much is clear that no money can be forthcoming until intending borrowers organize themselves into what the law calls "national farm-loan associations" and they must be organized as directed by the law and by regulations to be issued by the Federal Farm Loan Bureau which will be organized in the Treasury Department in Washington. Therefore nothing can be done until the machinery at the government end is installed and put in operation. It can be seen, however, that the initiative is in the local association of intending borrowers. There is no way by which an individual borrower can approach the source of funds except as he associates himself with others in his vicinity (who also wish to borrow) in a "loan association"—unless he may become associated with them by a bank, which by complying with prescribed conditions, may share in the dispensation of rural credit. When the borrowers form loan associations, as prescribed by the law, the latter start onward to membership in district land banks (which

can issue bonds upon the mortgages of the loan associations) and onward to connection with the United States Treasury, which by furnishing funds may participate in, and must regulate, the operations of these land banks.

As the way to begin is naturally most interesting to those thinking of applying for rural credit loans, we take a few provisions from the latest copy of the law we have received and which are probably reasonably the same as in the final enactment:

Ten or more persons who are the owners, or about to become the owners, of farm land qualified as security for a mortgage loan, may unite to form a national farm loan association: the loan desired by each person is not more than \$10,000 nor less than \$100 and that the aggregate of the desired loans is not less than \$20,000; each person desiring to borrow shall subscribe for shares of stock in the association to an amount equal to 5% of the desired loan—such subscription to be paid in cash upon the granting of the loan. Shareholders shall be individually liable to the extent of the amount of stock owned by them at the par value thereof in addition to the amount paid in and represented by their shares. No loan shall exceed 50% of the value of the land mortgaged. No loan shall be made to any person who is not at the time, or shortly to become, engaged in the cultivation of the farm mortgaged. The time for loans to run shall be from five to forty years and cancelled by amortizing payments, but more, even to the whole obligation, may be sooner paid on proper notice.

The interest on the loan shall not be more than one per cent greater than the interest paid to the holder of bonds issued on the mortgage, and heavy penalties are prescribed if any officer of an association should receive any commission, fee or perquisite for making a loan.

Thus it appears that the first thing to do to get rural credit is to get together. This will be much easier through existing rural organizations wherever they exist. In any local grange, union, farmers' club, fruit exchange, etc., etc., those who desire loans for farm equipment, land purchase or improvement or other legitimate farming purpose, can move towards rural credit by gathering such intending borrowers into suborganizations which can comply with the rural credit requirements. The way to begin would be to set the subject for general discussion, in the course of which those personally interested would disclose themselves to each other. As soon as a local farmers' organization gets into action on this live topic its affairs will command new interest in the community and desirable additional membership can no doubt be had, which will help the society in all its undertakings. We have an idea that rallying farmers around the subject of rural credit will awaken new interest in co-operative endeavor generally and give new force for the solution of marketing and other problems which are now presenting themselves for concrete action. What group of our readers will move first along this line and write to us that they are on the way?

FACTS WHICH WILL GOVERN.

OUR esteemed contemporary, the California Fruit News, goes at it, to the width and depth of a page of type, to demonstrate the horrible danger there is in the well-capitalized, corporate organizations of producers to protect and promote the sale of California products. Our esteem for our contemporary rests upon its editor's manifest disposition to state facts carefully and conscientiously, and we are not surprised to find ourselves perfectly in accord with him in his statement of the following facts, viz:

First: Any one can buy stock in these corporations.

Second: If growers who make contracts to sell their products are the same who own the stock, the thing is fine, but this need not be the case and if it is so in large part at one time it need not be at another time.

Third: It is among the possibilities that contracting growers may find themselves on the outside and only looking in at the institution which was built up at their expense.

Fourth: There is a difference between the ownership of the stock of these institutions and the ownership of the product. They should be identi-

cal, otherwise it is not a growers' co-operative institution.

Fifth: These organizations are being built up in such a way that the operators may be one thing and the growers another, and they may or may not be the same in large or small part. When growers' contracts expire the brands and the business belong to the corporation and not to the growers.

We acknowledge that these are facts, and they have alternative consequences all the way from high good to low evil and the jack of chicanery can jump in if the growers do not watch out and hold on to the game. Now "calamity howling" consists in seizing upon the worst possibilities and making bogey-men out of them, and at the same time ignoring the facts which make the best possibilities practically sure of realization. That is what our contemporary is doing. And what are the facts which will really govern in the conduct of these organizations? We will try not to indulge in argument, but simply state facts so great, glorious and illuminating that our contemporary will be ashamed of the little black devils which make him shiver with fear:

First: The great, shining and illuminating fact is that growers' preponderance in ownership of such an incorporation notably increases as success is demonstrated. This is the experience of the raisin growers' corporation and the fact has 100 per cent efficiency, because it is the only fact there is to demonstrate growers' attitude in this type of organization.

Second: All non-producer stock-owning in the raisin association, and all stock subscriptions in newer corporations which will follow its example, are by organizations and individuals who consider their interests identical with the growers' interests and believe their own prosperity and patriotic satisfaction lie in backing the growers to the attainment of their fullest requirements and amplest rewards. This is a declaration of noble purpose on the part of these outside stock-owners, which a calamity howler impeaches at his own peril.

Third: These supporting stock-owners are acting as trustees for public opinion and their action is the most concrete and emphatic demonstration possible of what that public opinion is. Public opinion is most glorious to reflect: it makes a man's heart swell. Public opinion is most dangerous to defect: it is calamity howling.

Fourth: Without the public-spirited co-operation of individuals and institutions of financial power and patriotic influence, capable organizations could not begin their beneficent work. To prescribe a form of organization which could not draw its first breath because of the hostile atmosphere of existing commercial environment, is economic infanticide. To successfully float an organization resting upon community interest, pride and satisfaction and to see that organization grow in growers' support and in mastery of its world-job of fair trade is a constructive economic policy.

Fifth: The only fact there is bearing upon the fact of possible perversion of good will, trade brands, etc., to hostile corporate ownership, is that thus far growers have tightened their hold upon these valuable things and to anticipate other action on their part is to impute foolishness to them.

Thus we have admitted the five facts which our contemporary chooses as the basis for his contention. Thus we have presented five greater facts for his careful and conscientious consideration.

Transplanting Olives.

To the Editor: Is it best time to plant olives when rooted one year, or is it better to leave them in the nursery until they are two years old?—Reader, Valley Center.

Trees which have made a good free growth in the nursery at one year old are all right to plant out. Those which have done little may be allowed to stand another year where they are; or, if more convenient, be replanted in nursery row for another year or more. Olive trees transplant readily at greater age than common fruit trees, if the roots are not allowed to dry. The best time to

plant is after the cold weather and heavy rains are over and the ground is warm and moist. This occurs, in different parts of the State, from February to April according to situation and local rainfall.

Irrigating Figs.

To the Editor: Please advise me whether or not irrigating Calimyrna figs at this time, or later, would tend to sour or split the fruit or otherwise work any injury. The trees are from 12 to 14 years old, fairly thrifty and the land has a heavy tendency though a trifle sandy.—Grower, Tehama.

Irrigation must always depend upon the character of the soil and the condition of the trees when carrying fruit. If they show signs of needing water its application should be moderate so as not to cause a marked change in growing conditions which might produce bad effects when fruit is nearing maturity. Two light irrigations would therefore be safer than one heavy one, because likely to produce more gradual changes in sap-flow, especially on a heavy soil. But in Fresno on deep light soil they irrigate freely in July, flooding as copiously as they do in irrigating alfalfa, with good effects.

Deep or Shallow Plowing for Grain.

To the Editor: I have a piece of good fair land, almost no alkali and only small sage brush, twenty-five miles west of Bakersfield, which I want to put in grain. My belief is that fairly deep plowing—around 10 inches—would be of great service in conserving moisture, but I am told by the surface-farmers of that region that deep plowing there means no crop. My own observation is not very extended in that region, but so far as it goes it does not confirm this prejudice against deep plowing for grain. I have found the largest Kafir corn, etc., on deep plowed land; and moisture enough in the under-soil to finish up a good crop. What basis is there for the belief that the upper five inches of soil must not be disturbed by turning in and mingling with the 5-inch layer immediately below it?—J. E. C., Bakersfield.

If you intend to clear off this land and get in grain for next winter's growth we certainly advise you not to plow deeper than five inches. If you break it up this fall for a summer fallow during 1917 as a foundation for future cropping deep plowing would be rational, but whether it would pay you for the extra work and the delay we do not guarantee. Your land is new and has presumably been acted upon by natural mellowing influences for a long time. All you need to do is to provide surface cultivation. If you plow deep you must settle the land by deep harrowing or sub-surface packing or wait for the rainfall to melt it down, because both wheat and barley demand a reasonably firm soil to root into and are quickly ruined, in a region of light rainfall, if there is too much open soil under them. This is why your neighbors say you will get no crop at once on deep plowing, and they are probably right. Sorghum is less sensitive to a loose bottom, but whether it likes it better because it can more successfully root through it or whether it is so much more drouth resistant than wheat and barley that it can show success while they fail, is a question. It is not a matter of the first or second five inches of soil, it is a matter of plant-habit and moisture movement to the roots.

Sprinkler or Ditch for Fruit Trees.

To the Editor: What is the best way to water young trees, especially fig trees, on sloping land? At present I loosen the ground with a hoe and then apply the water to the tree for about half a day with a lawn sprinkler, the water coming through a half-inch pipe. The water spreads nicely and does not run off. I am told that I was doing more harm than good as this encourages the growth of surface roots which the plow will cut the next spring and cause suckers to grow. If I take off the sprinkler the water will run off unless I am there to watch it. Kindly give me your idea about the sprinkler. The ground is a medium light loam, no hardpan.—A. O., Wrights.

Probably the best way is to basin around the trees a little and connect the basins with a ditch or furrow running across the face of the slope, nearly level so the water will run very slowly, and then use a small stream from the pipe so the water will be soaking in a long time. If you prefer the

sprinkler method go ahead with that—following with a good cultivation, several inches deep, as soon as the surface dries enough to work well. This wastes some water by drying out, but if you do the cultivation well you need not fear much surface rooting. If you sprinkle, let the surface bake and then sprinkle again, it is not a good way.

It Needs Good Farming.

To the Editor: What would you suggest as a good soil builder on a hill ranch near Pleasanton, reddish sandy clay loam top soil, and sandy clay subsoil? The hardpan is apparently more than four feet below the surface; up to that depth I have not encountered it. Some of the land is quite steep, some of it is adobe, and all of it has suffered from erosion and neglect. Would a combination of soil blasting, liming and cover crops be the best method to adopt, and would the result warrant the expense? Oats, barley, nuts, some of the small fruits and vines do very well in this locality without irrigation; also potatoes and corn, dry farmed, do well in some places; but vegetables, alfalfa and root crops do not amount to much unless irrigated. Is there a way to sow my hills to natural pasture, that is to grasses which when sown will reproduce themselves from year to year?—L. A. B., Oakland.

The best soil-builder for you is good diversified farming: good tillage, plenty of manure, reasonable investment in commercial fertilizers, lime and cover crops. As you seem to have a free soil to a greater depth than four feet it would be a question for a practical test to see how blasting affected it. Shoot a little and watch. Most vegetables and root crops would do well if planted in the fall, as soon as the soil is well wet with rains. Alfalfa would also probably do much better than you think, if started in the fall, and would probably give you good pasturage after you have used up wild pasturage in the spring. Wild oats and bur clover will be good things to sow on steep parts and will keep coming if you give them a chance to seed in the spring. Get some stock on the place if you have land enough. They will help you do other things.

Suckering Thompsons.

To the Editor: Should Thompson Seedless vines be suckered? They have been suckered 18 to 24 inches above ground. Does it hurt them?—S. S., Kingsburg.

Viewing the whole vine as a vegetative concern, the removal of suckers may be regarded as reducing foliage which would contribute to the strength of the root and therefore a loss to the vigor of the vine. But viewing the vine as a concern for producing fruit which must have its fruiting wood properly placed and properly nourished by the root, suckering must be done or the vine cannot do what you expect it to do. You have apparently prepared for this by suckering already to the height you mention. You must continue to protect the effective form of the vine by suckering away shoots which appear later where no canes are desired. Removing suckers which may break out in the head or arms of the vine and which are usually called "water-sprouts" or "adventitious shoots," usually indicate that the vine has more vigor than the bearing wood you have left is able to employ and suggest that on such vines you should give more length of cane at the winter pruning, or arrange for more spurs on the arm. As a rule it is probably better for the vine not to remove these top-suckers. They can often be cut back for additional spurs.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., July 4, 1916.

STATIONS	Past Week	Rainfall Data		*Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

Los Angeles	0	0	0	80	56
San Diego	0	0	0	74	58

*Temperature data include 3rd only; i. e., for 6 days.

Statewide Uniform Fruit Inspection.

Lack of uniformity in inspection of fresh fruits for interstate shipment, and no inspection at all in some districts, is one of the few weaknesses of the present law.

[Written for Pacific Rural Press.]

The fresh fruit standardization law in action has shown up some few defects.

Lack of uniformity in inspection and enforcement of the law is chief of its weaknesses. A fertile source of irritation is the fact that counties having no horticultural commissioner may ship any old kind of fruit unless 25 resident fruit growers petition the county supervisors for inspection and enforcement of the law.

One of the principal early fruit shipping counties in the State has had no inspection this year, and any sort of fruit has been shipped, that the growers or shippers there cared to get rid of. This has worked a special hardship on the fruit districts in the adjoining county. So-lano people have shipped immature fruit which has been gobbled up at high prices as usual for the first shipments of each kind of fruit; and they have had a highly prosperous season.

Meanwhile, Yolo fruit growers must keep hands off the highest prices and see their neighbors injure their markets.

Consolidation Carloads.—Much of the Solano early fruit is shipped in small lots at through carload rates to Sacramento or Newcastle, where it is consolidated with other fruit into carloads for the East.

In inspecting this at Newcastle, the inspectors have avoided as much as possible having local growers around when the fruit was exposed. Those who did see it, made such a righteous fuss, that finally all three Newcastle companies handling such consolidation fruit, co-operated with the inspectors in ultimatums, the last of which was delivered June 17, stating that such fruit would thereafter be summarily condemned. To condemn such fruit would cause loss of the local freight rate which might have to be paid not only on the condemned fruit, but also on whatever good fruit was included in that shipment. Condemnation would throw the immature or poor fruit onto the California markets to bring whatever price it could.

Other counties also have shipped immature fruit to Newcastle for consolidation. This was sometimes to avoid being unduly hard on folks to whom the law was new, but who seemed willing to improve when shown.

It also occurred partly from lack of adequate inspection due to the cost of enough inspectors, whose salaries are supposed to be paid by the counties.

Part of the lack of uniformity of fruit shipped this season under the law is due to the various judgments of the various inspectors all over the State.

Part of the trouble lay in ranch packing houses so widely spread that no reasonable number of inspectors could do them justice.

Instances of Difficulty.—F. B. McKevitt says of the grape packing last fall: "In the Tokay section, I am unable to report as good results as in Fresno. This was largely due to

more of the Tokays being packed by farmers. Where they are packed in commercial shipping houses, it is easy to watch and get results. I believe that the results in Fresno are such that there will hereafter be no difficulty in getting enough inspectors, especially in the Lodi district, to get as good results as in Fresno."

Imperial county this season felt unable to pay enough cantaloupe inspectors, so the shippers' inspectors were appointed by the county and they served well.

Each of the three fruit shipping houses in Placerville has an inspector who was under direct supervision of the Standardized Fruit Alliance, but is now in charge of county horticultural commissioner J. E. Hassler.

Placer county shippers' inspectors are helping the county inspectors.

Fresno employed her own, and also a chief inspector to standardize the work of the others. Inspection was further made uniform by weekly meetings of the inspectors early in the season. "As the season advanced, the work of inspectors and packing houses became more uniform," writes horticultural commissioner F. P. Roullard. "There were fewer trouble calls, and the chief inspector was enabled to cover the Fresno houses."

Last year there was much grape mildew; and stem-mildew was allowed to pass. This year there is little; and none will probably be allowed to go East.

It is difficult to get suitable results on some ranch packing houses due to lack of vigilant supervision of packers, also to poor light in packing sheds, etc.

Difficult to Prosecute.—Enforcement of the law now being in the hands of the local commissioner, puts him in a bad fix. D. F. Norton, horticultural commissioner of Nevada county, says, "This is one of the weak and objectionable points of the law, as it would be next to impossible to get a jury to convict; and very few horticultural commissioners would relish the job of swearing out a complaint against a fruit grower."

"It should be made a misdemeanor for any common carrier to accept for interstate or foreign shipment any fruit not passed by an inspector and stamped 'Standard Fruit.'"

It would probably be easier to convict a railroad of a misdemeanor! Mr. Roullard had a grower convicted, but the case was appealed.

Remedy Suggested.—A plan suggested by the State and county horticultural commissioners, the State Market Director, and certain shippers and growers, to overcome all the above objections to the greatest degree possible, is to make the law apply to the entire State, place its enforcement in the hands of the State Market Director, let him hire and pay all inspectors and fire them on petition by local growers or shippers if reasonable objections are shown. Let the State Market Direc-

John Deere Implements

John Deere Plows for Light Tractors

With High and Level
• Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.

Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.
2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.
3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

A Farm Book For The Asking

BETTER
FARM
IMPLEMENTS
AND
HOW TO USE THEM

A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152. Write for your copy today.

tor issue uniform rules for enforcement of the law, employ enough traveling supervisors to insure uniform inspection, and have frequent conferences of these supervisors with himself. Let him promulgate, after suitable hearings, rules for the building and management of packing houses.

Stamp for Standard Fruit.—Have a stamp for each package of inspected fruit, as the State has for apples. A stamp costing ½ cent goes on every State inspected standard box of apples. It is made attractively and is a good advertisement as well as paying all expenses of inspection. For fresh fruits under the law, it

would preferably read something like, "This package is one out of a lot — per cent of which have been inspected by the State." It is impossible and undesirable to inspect every package. If any poor fruit slips through, it would thus not completely damn the State label. The apple stamp has increased the value of such apples 10 to 20 cents per box, according to F. S. Jerome.

Let the Market Director either enforce the law by fining or imprisoning the guilty grower, or do it by the easier method suggested by Mr. Norton.

A maturity standard will be discussed later.

Candied and Glace Fruits.

[Written for Pacific Rural Press by W. V. Cruess, University of California.]

Most manufacturers regard their processes as more or less secret. The methods given in this article have been used at the University successfully for citrus fruits, but have not been tried with other fruits. The same principle should apply in both cases, however. It can probably be safely assumed that the method given will give good results with deciduous fruits because it is simply a modification of a method given in the U. S. Consular Report 343 for 1909 by the Consul at Marseilles, for all kinds of glace fruits and nuts.

Candied Fruit is preserved by the large amount of sugar that it contains. The sugar must permeate the entire fruit or the untreated portion will spoil. The juice in the fruit must be made to contain finally 65 per cent sugar to prevent spoilage; that is to say, if a piece of candied fruit be pressed and the syrup from it analyzed, it will be found to carry at least 65 per cent sugar.

In order that the sugar or syrup can penetrate, the fruit must be softened by heating to break the tissues, and make channels for penetration of the syrup. Ordinarily, boiling the fruit slowly in water or dilute syrup until a darning needle will penetrate easily to the core or pit will be sufficient. The skin should not be badly broken and the fruit must not be boiled too soft.

If fresh fruit is boiled at once in a rich syrup, it will shrivel and become very tough. The most important point in the whole process is impregnation of the fruit by gradually increasing the amount of sugar in the syrup used on the fruit from day to day. The process can not be rushed without disastrous results.

The process consists in softening the fruit in boiling water, transferring to a weak syrup of 20 to 25 per cent sugar, drawing off the syrup at intervals of twenty-four to forty-eight hours thereafter, boiling it down until it is about 5 per cent stronger in sugar each time, returning fruit to the hot syrup till next day, etc., for succeeding periods of twenty-four to forty-eight hours until a syrup of 65-75 per cent is reached. This will take ten to fourteen days. It gives the syrup time to penetrate, and gives a product of uniform texture. Too rapid increase in the sugar of the syrup results in shriveling. The fruit must not be boiled in the syrup but simply covered with the boiling syrup in a jar or crock and allowed to cool by standing 24 to 48 hours.

Where large amounts of the candied fruit are to be made, a series of jars or crocks, each one containing a syrup about 5 per cent stronger than the preceding one can be used. Then the syrup need not be boiled down to increase the syrup 5 per cent each time, but need only be heated to boiling and poured on the fruit. The fruit can be transferred from one container to the next on each day until the end of the series is reached at 70 per cent sugar.

Fruit Sugar Needed.—Pure cane sugar as the fruit dries out would crystallize and set the fruit into the form of rock candy, whereas a well-made candied fruit should resemble in texture the original fruit and should not contain crystals of sugar in the flesh. When the syrups are made by boiling down, the boiling will change enough of the cane sugar into "invert sugar" to prevent formation of crystals in the fruit. If the series of crocks or jars is used and the syrups are not boiled to any great extent, about 25 per cent of the sugar used in making the syrup should be glucose, which does not crystallize so readily as cane sugar.

When the last syrup, 70 per cent, has been used, the fruit is placed on suitable coarse wire screens and the excess syrup drained off. The fruit should be allowed to dry a short time before coating with sugar. One of the following ways may be used:

Crystallized Fruit is made by placing the drained fruit prepared as above in a very concentrated hot cane sugar syrup which is almost at the crystallizing point. This syrup should be made by adding a very small amount of water to a large amount of sugar and heating to boiling. It should not be boiled very long or "invert sugar" may be formed which will not crystallize. The fruit is left in this syrup until well coated with crystals. It is then removed, drained, and dried.

Glace Fruit is made by taking the drained fruit from the 70 per cent syrup and dipping it quickly in a very rich hot cane sugar syrup—this syrup should contain so much sugar that it will set solid when it cools. The fruit must be dipped and removed instantaneously so that it does not heat appreciably. The cold fruit chills the thin coating of syrup so that it forms a thin transparent glaze—in this case it must not be allowed to form crystals on the surface of the fruit.

Anderson Combination Dipper, Perforator, Grader and Spreader

Send for new CATALOG of Packers' and Dryers' Machinery.

REVISED JUNE 6 1933 OCT 1 1935 SEP 16 1938

The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1916 CATALOG.

It illustrates and describes the entire Anderson-Barngrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

Anderson-Barngrover Manufacturing Co., 320 West Julian Street, San Jose Cal.

SAN JOSE, CAL.

Compare the Cost

TWENTY years ago a farmer borrowed \$1,000.00 at 6 per cent straight on the old fashioned loan plan. He has renewed the loan at intervals with constant expense of renewal commissions, abstract charges and recorder's fees, and he still owes the principal sum of \$1,000.00

He has paid \$60.00 interest every year for 20 years, a total of 1,200.00

Total cost to farmer, including \$1,000 still unpaid.....\$2,200.00

Under the amortized rural credit plan, his total interest and principal payment would be \$90.76 a year for 20 years, or..... 1,815.20

A saving on a loan of \$1,000 of.....\$ 384.80

The following table shows the amount of INTEREST SAVED by borrowing on the amortized or rural credit plan:

Amount Borrowed.	Annual Payment Amortized Loan.	Total Payments. 20 Years.	Straight 6 per cent for 20 years and Principal Repaid.	Interest Saving Amort. Loan.
\$ 1,000	\$ 90.76	\$ 1,815.20	\$ 2,200.00	\$ 384.80
2,000	181.51	3,630.20	4,400.00	769.80
4,000	363.02	7,260.40	8,800.00	1,539.60
8,000	726.05	14,521.00	17,600.00	3,079.00
10,000	907.56	18,151.20	22,000.00	3,848.80

We think this amortized loan which can be paid off any time is the best loan, for the farmer, being offered in California, but if preferred, will make 10 year loans, annual interest and favorable prepayment options. Both types, each being for a long term, offer a big advantage in selling a farm, for each gives buyer longer time to pay out than sellers or other loan companies generally grant.

Full information given on request without obligation to borrow.

† Horticultural commissioner has insufficient information for a report.
 ‡ Not grown commercially. h Harvested.

* Less than 2 per cent of State's normal crop grown in county.

Figures for this table are furnished to Geo. P. Weldon, chief deputy State Commissioner of Horticulture, by the various county horticultural commissioners, who seem in better position to give accurate unbiased estimates than anyone else. They base their estimates on observation, reports of their local inspectors, growers, etc., by mail, conversation, and telephone.

Under each fruit are two columns: the first represents the percentage, grown in that county, of the total State output of each fruit (not the per cent of bearing acreage). These estimates are based on the normal crops of previous years, as indicated by the best and most widely corroborated statistics which Mr. Weldon could find. That they are very nearly accurate is indicated by the fact that in the case of oranges last season, the county horticultural commissioners reported to Mr. Weldon the production of each county, which was unknown to the Cal. Fruit Growers' Exchange by counties. The total, however, was almost exactly the same as the Exchange's State total.

The second column under each fruit shows the estimated condition of the crop on the basis of 100 as normal. Comments below apply only to the principal producing counties.

Almonds lower than last month in Butte and higher in Contra Costa, same as last month elsewhere.

Apple estimate increased to 100 per cent in Sonoma, no change elsewhere.

Berries better in Sonoma, no change elsewhere.

Figs no change in estimates.

Olives light in Butte account drouth and wind.

Peaches look 10 per cent better Fresno, no change elsewhere.

Pears, 8 per cent better Lake, no change elsewhere.

Plums late varieties 5 per cent lower Placer, same elsewhere.

Prunes 5 per cent improvement Santa Clara and Sonoma.

Walnuts 30 per cent better Santa Barbara, no change elsewhere.

OLIVE PICKLING POINTERS.

To the Editor: How can I remove bitterness from olives before preserving?—M. T., Moraga.

[Four hundred olive pickling tests were made last season by Prof W. F. Oglesby of the University of Cal. It was found that only potash and soda lyes could be used to destroy the bitterness. Lyes of two to four per cent strength gave best results. Weaker lyes acted so slowly that bacteria injured the fruit. Stronger lyes softened it.

To darken and equalize the color two lye treatments are necessary, the first penetrating one-fourth, and the second three-fourths of the way to the pit; each followed by twenty-four hours exposure to the air.

Economy of material and improvement of quality was found to follow the continued use of the same lye, a little potash or soda being added each time to replenish that neutralized by the olives.

Frequent stirring during the lye treatment was found necessary for evenness of color. Rinsing for five minutes after the lye treatment and before aeration, gave a blue-black color with ripe fruit.]

DRYING FIGS.

To the Editor: Please give a process of drying dark blue figs.—Mrs. J. M. H., Oakdale.

[As you probably do not have

many, sweep the ground clean under trees, let the fruit fall, lay it on fruit trays in partial shade if convenient, until they are well dried but not hard. This will take a week or 10 days. One big Fresno fig grower dips them in salt water 10 to 30 minutes and dries them in the stack; but his country is hotter than yours. Prepare to keep birds off. If you sell the figs in bulk, do not dip them in anything after drying. If you wish to pack them yourself, dip in boiling 5 per cent salt water or very thin boiling syrup for half a minute or so to sterilize and give them a bright color, then grade, cull, and pack.]

EVERY WEIR NEEDS ONE

The Sentinel Recording Weir-Gauge

Automatically Checks and Records Every Variation of the Flow Over Your Weir, and the Time it Occurred.

Easy to install, Simple in Operation, Durable in its Construction, Positive in Results.

END the Morning Glory PEST with Nonpareil

"We have given Nonpareil a very good trial and find that it destroys not only morning glory but also horse radish. We consider it a thoroughly satisfactory weed exterminator."

—Luther Burbank.

If you want full profits from your crops you should use Nonpareil. It is easy to apply and economical to use—one gallon is sufficient to kill 250 plants. It does not injure the ground but acts as a tonic. It is the most successful weed killer known. Write today for interesting folder.

Improving Rural School Conditions.

(Continued from page 25.)

Of the 51 schools in the county there is at present just one "All Star" school. This is in the Soda Canyon district and was constructed

the competitive spirit has led to three additional features: a flag pole, septic tank, and running water, all of which had been omitted in the

A STANDARD SCHOOL

NAPA COUNTY, CALIFORNIA.

FLAG—Must be flying, weather permitting, also one must be displayed in each school room at all times during the school sessions.

SCHOOLHOUSE—Property lighted with light from left side of room (or from left and rear) through window space at least one-fifth of floor space in area.

EQUIPMENT—Teacher's desk and 2 or more visitors' chairs; desks should be individual, separate, adjustable, clean; suitable blackboard; window shades in good condition; recitation bench (the latter not essential, but nice); library table; a modern fire extinguisher of some sort to be provided each school; flies and mosquitoes excluded absolutely by thorough screening of schoolhouse.

HEATING AND VENTILATING—Jacketed stove properly situated, minimum requirement; window boards or some other approved method of ventilating.

ROOMS—Attractive at all times.

STANDARD PICTURE—One new one, unless three are already in the room, framed.

GROUND—To be clean, free from paper, etc. At least three features

of play apparatus. Walks if necessary.

SANITATION—Pure drinking water; either drinking fountain or covered tank and individual drinking cups; individual family or paper towels.

OUTBUILDINGS—At least two good ones, to be sanitary at all times and free from marks. They should be thoroughly and effectively screened.

TEACHER—Must maintain good order at all times, supervise the playground; have her work well prepared; follow course of study; take at least one educational journal; have programme posted in room; keep register in good condition; be neat in attire.

LIBRARY—Good selection of books from county list. Case for the books. Books kept upright in good condition and recorded according to rules specified by California School Law.

ATTENDANCE—Average 95 per cent for year and not to exceed two per cent in tardiness for year.

LENGTH OF TERM—Not less than nine months of school each year.

TRUSTEES—School visited once each term by Trustees.

THIS CARD IS HUNG IN EVERY SCHOOLROOM

Each requirement earned is marked with a star. When all requirements are fulfilled a suitable pennant or certificate is awarded by County Superintendent. Standard raised yearly.

Adopted by the Napa County Farm Bureau, Committee of School Trustees and Napa County Board of Education, July 2, 1915.

before the present movement began, along modern lines, as shown in the accompanying illustration.

But even this school has been benefited by the new movement; for

original plans. Needless to say, it is the envy of every other Napa county school district, and the kind that all will have before the farmer-parents will be satisfied.

POISONING FIELD MICE.

To the Editor: How can we eradicate field mice?—J. C., San Francisco.

[Answered by Prof. H. C. Bryant, University of California.]

[Meadow mice or field mice are most easily destroyed by poison. The U. S. Dept. Agr. advises the following formula:

"Dissolve an ounce of strychnia sulphate in a pint of boiling water; add a pint of thick sugar sirup and stir thoroughly. The prepared sirup may be scented by a few drops of oil of anise or rhodium, but this is not essential. A half ounce of borax is said to keep the mixture from molding.

"The above quantity (a quart) of sirup is enough to poison a half bushel of wheat or corn. If after thorough mixing the solution is not sufficient to wet all the grain, add a little water. After standing over night, if the grain is too wet, a little dry corn meal will take up the excess moisture. If oatmeal is used as a bait, when the mass is wet throughout with the sirup, it may be used immediately."

When meadow mice became exceedingly abundant in Nevada in 1907-8, chopped alfalfa soaked in a

strychnine solution proved the most effective poison.]

EGYPTIAN CORN PRICE.

To the Editor: Why is Egyptian corn lower than the average at this time of year (June 8)? Is the price likely to rise soon?—Sub.

[Answered by John Cook, Moore-Ferguson Co., San Francisco.]

[The value of Egyptian corn is governed to a great extent by the cost of wheat, which is quite low at present. In previous seasons at this time of the year stocks of Egyptian corn were small; while now a large quantity is in growers' hands, which adds to the depression. Unless wheat should advance I do not anticipate much improvement in the value of Egyptian corn.]

Fifty thousand ladybugs to eat prune aphids in Kings county orchards were recently sent from the State Insectary.

CUT FLOWERS

Cut out the Middleman. Buy direct from the Grower. All varieties of cut flowers in season direct from the plants, sent by parcel post or express. Also floral work of all kinds. Try a sample order. 40 varieties of ferns in 4-inch pots now ready, 25c each.

It's Good-by Pests

Why be bothered with pests when "Corona Dry" is so easily and cheaply applied? Eliminates every known garden pest swiftly and surely. Use "Corona Dry" first—before the bugs get busy. The most convenient, efficient and economical insecticide on the market. Used by the most successful commercial growers and planters of the nation. No spraying necessary—it is applied in dust form. For corn dust on silk—no damage to ear or fodder. Free booklet "Garden Pests and Their Control." Ask your dealer for "Corona Dry."

Germain Seed & Plant Company
326-328-330 So. Main St., Los Angeles.

If you use "CORONA DRY"

One of the many styles and sizes of Fruit Trucks I manufacture. Sixteen years of experience has taught me how to make trucks that will stand the hard knocks and that will last. For prices and particulars, address

BROEDEL ORCHARD TRUCK CO., 552-556 South First St., San Jose, Cal.

GOLDEN GATE WEED CUTTER AND MULCHER

Farmers, order early if you want the Golden Gate Weed Cutter and Mulcher, as the demand this year will be great, as it not only cuts weeds, but kills them, and leaves finely pulverized top soil. Cuts any depth. Prevents evaporation by working under the soil without disturbing soil on top. Write for circular.

C. G. SIGURD,
Capitol Avenue and McKee Road,
San Jose, Cal.

Mechanical Power on the Farm.

BERMUDA AND SALT GRASS. LEVELING EXPOSES DEAD SPOTS.

To the Editor: We have a 60 h. p. wheel tractor and disk plows. Is it a good plan to disk salt grass and Bermuda sod several times in July and plow it about the last of August, or to plow and randall it lightly at first and plow it deeper afterward. Does land leveled with an engine scraper need a rest before planting alfalfa or vines?—G. R. Mc., Selma.

This does not show tractor implements; but it shows cultivators such as have been used successfully in killing Bermuda and Johnson grasses.

[Plow deep at first and as soon as you can get to it, then stir the roots deeply every four days until everyone you can find has turned brown clear through. David Porter of Hanford did this with a Planet Junior cultivator, like those in the picture

but with seven sweeps overlapping each other.

It took three months to kill his Bermuda and Johnson grass but it took only half a day each time to cultivate five acres with a team. With your tractor and a tractor implement you could handle larger acreage. You might as well do it deeply and all at once.

Land leveling where two or three feet of top soil are taken off, leaves exposed, spots that are likely to be

"dead" except in very light soil. Bacteria which are essential in making plant food available and which must have air, must be given time to become established in the exposed subsoil before it can become reasonably productive.]

ALFALFA MEAL GRINDING.

To the Editor: What is the right time to grind alfalfa hay into alfalfa meal? Can this be done at any time and is baled hay all right for the purpose or is it better done immediately after harvesting, as then the hay is in its most brittle state? Will alfalfa meal deteriorate materially with age? Can it be kept in bulk in large bins or must it be kept in sacks?—E. L., Chico.

[Grind your hay whenever you can get to it, provided it is dry—the drier the better, if you can grind at the stack, without losing leaves by hauling.

Alfalfa meal is always stored in sacks as far as we know, but for home use, we see no reason for not using small bins if it is and can be kept dry. Chopped alfalfa is often stored in hay mows, but exerts such pressure that special bracing is necessary, or else stacking with space next to walls.

Age has no practical effect if kept dry. A big commercial alfalfa meal grinding company in the San Joaquin Valley is not expecting to run much this year, because its raw product costs so much that with profit, expense of grinding, sacks, and freight added, the meal would have to sell at a price that would enable mill feeds to compete.

On the other hand, as a rule, we would say that whenever it pays to feed alfalfa hay, it pays better to feed meal, for most of the alfalfa that he feeds to cows; and all of what he feeds to hogs and chickens except as pasture.

The meal is always more valuable for feeding these animals than the hay, because it is practically all saved and eaten. This makes the biggest

difference with the first and last crops which often are foul with weeds.

Coarser Meal Desirable.—We have a report from Washington State that on several cows that died, autopsies showed hard balls of powdered alfalfa meal. Several mills there have quit running for this or other reasons; and it is said that they simply ground the meal too fine.

Where it is really ground, there is an objection that it is injured by sort of cooking. There are various means of chopping or cutting alfalfa hay on the lawn mower style. Two companies have attachments which they put onto their silage cutters for finely chopped alfalfa.

On the Acme, a screen with holes of the size desired, encloses the cutter on all sides except the entrance. Thus the revolving knives carry it over the cutter bar repeatedly until it is fine enough to go through the screen.

This machine is built in six sizes. The smallest is figured to cut 1000 pounds of meal per hour with a 5 to 8 h. p. engine. The largest size is built for 3500 pounds per hour being run with 15 to 20 h. p. The same machines without the attachment will cut 4 to 6 and 16 to 30 tons respectively, of green corn silage per hour.

Two points are noted in connection with this cutter: (1) the small diameter of the revolving knives, requiring less power to do the cutting which of course comes at their circumference with less leverage; (2) the bevel edge of the cutting knives is on the side of the blade opposite the cutting bar. Whenever they get nicked or dull, they can be sharpened

Every Imaginable Style and Size

Layne & Bowler Pumps are not limited to any particular style. We manufacture pumps of practically every approved style and size, and each embodies our high standard of quality. We manufacture over twenty different kinds of pumps, including Low Lift, Medium Lift, and High Duty Turbine Centrifugal, Horizontal Centrifugal Pumps, Plunger Pump Heads and Deep Well Cylinders. We also build to order special pumps to meet any condition. Therefore, no matter what your pumping conditions may be, there is a Layne and Bowler pump to do the work, and do it at the very least cost.

Write at once for our new Catalog No. 25. It describes different pumps and gives information invaluable to prospective water users. Contains 125 new illustrations. Write today.

REDWOOD TANKS—SILAH.

Thirty-five years in this Business in Stockton.—A 500-gallon tank, \$8.00. A tank 6 ft.x2½ ft., \$7.50. Other tanks equally cheap. I deal direct with the consumer. You will save 10% to 25% by dealing with me. All sizes in stock. Clear dry redwood. Direct from the mill by vessel. Write latest improved machinery. Doors, Windows Frames, Mouldings. Phone 2957. **F. F. WILSON, STOCKTON, CAL.**

by anyone by grinding on the beveled side. If this leaves the edge irregularly curved, it still fits close to the cutting bar and cuts the feed rather than shredding it.

There are special points of excellence on all machines, which should be investigated soon now.]

HOW MUCH HORSEPOWER?

To the Editor: My well is 25 feet deep, the tank 50 feet from the well and 16 feet off the ground. I want to put a gas engine and 1½ inch centrifugal pump at the bottom of the tank. How much horsepower will be required?—Sub., Guinda.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[To determine the friction head against which you must pump, it is not only necessary to know the length of pipe but also the size and number of elbows and valves. This, however, is not important, so long as the pipe is large enough. If we should estimate a friction head of 9 feet, then the total head made up of this and a suction lift of 25 feet and a forced lift of 16 feet will be 50 feet.

Referring to a manufacturers' list, I find that a 1½ Gould single stage centrifugal pump, operating at 1800 r. p. m. will discharge 70 gallons per minute and require 2.6 H. P. This provides for the loss of power in the pump. This size of pump is not efficient in your case.]

BLASTING STRAIGHT DITCHES.

The force of an explosive always goes in the line of least resistance, regardless of direction up, down, or sideways.

In blasting out a ditch the idea, of course, is to excavate the earth in a straight line. To insure this, experience has shown that it is well to make the line of the ditch the line of least resistance by plowing a furrow, or two furrows, where the ditch is to go. This is particularly desirable where there is heavy sod. When the explosions occur, the gases force the lower earth out right on the line of this furrow, and there is little tendency to gouge out twists or bowls. Two furrows can be used to advantage in sod that is likely to hang together and fold back over the edge, or even fall back into the ditch, instead of tearing loose and flying away. Make them as far apart as you want the ditch to be wide. The explosive will then throw out the material, sod and all, that is in the strip between the furrows. If the ground is too brushy, too swampy, or furrows can not be made for any other reason, it would be as well to cut the sod or ground with a shovel on one or two lines.

Of the 93,111 motor cars registered in Minn. up to Nov. 1, 1915, 46,562, or over 54 per cent, were owned by farmers.

A garden tractor to be operated like a lawn mower by a man walking behind it is being made in the East. Various garden tools may be attached as with the Planet Junior.

Do It Electrically

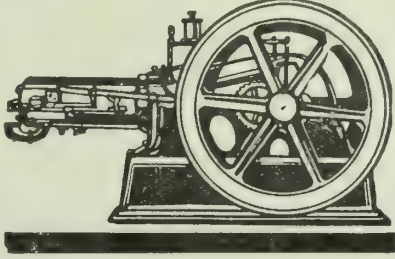

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers. **ELECTRIC APPLIANCES** include **CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS** and every other appliance that is needed in the modern home, not forgetting **ELECTRIC FANS.**

General Agricultural Review.

DECIDUOUS FRUITS.

Every peach in Tulare county is reported sold.

Visalia canneries are ready to begin the fruit run.

Bartlett pears from Sutter county started east last week.

Elberta shipments from Armona will start about Jul. 15.

California has shipped 265½ cars of peaches to June 27, while Ga. had shipped 334.

Dried apricots were being delivered the last of June to Kings county packing houses.

Shipment of the 500 tons Tulare county peaches recently sold to Pasadena canners, has begun.

Pear blight has been discovered in Paso Robles district which has hitherto been free of the disease.

A rest cottage and flower gardens have been fixed for the 400 women employed at the Selma plant of Libby, McNeill & Libby.

Total apple exports last season from North America were 1,437,587 barrels. The highest previous season was 1896-7, 2,919,846 barrels (including boxes at 3 per barrel).

The Sebastopol Apple Growers' Union reports many new members. Their Sebastopol and Stony Point houses began operations about Jul. 1. Graton and Forestville houses began earlier.

The California Peach Growers has bought a number of packing houses and warehouses in San Joaquin valley from the Associated Raisin Co. and is negotiating for some in the Sacramento valley.

An eastern apple buyer recently told Manager E. C. Merritt of the Sebastopol Apple Growers' Union that he could pay 25 cents more per box if no Gravensteins could come to his market except through the Union.

New York City exported 600,000 barrels of apples in 1880-81; 364,452 barrels 1915-16. Of the last season's total American exports Liverpool took 526,195 barrels; London, 373,882 bbl.; Glasgow 339,422 bbl.; others 197,928 bbl.

The National Standard Barrel law became operative July 1. Fruits, vegetables, and other dry commodities, for sale or shipment, unless sold exclusively by weight or numerical count, must be packed in barrels of 7,056 cubic inches interior capacity.

CITRUS, NUTS, SEMI-TROPICAL.

Increased almond acreage in Sutter county is expected to fill the vacancy caused by light crops.

Withertip has attacked practically every citrus orchard in Fla. Pruning it out in June and July is practiced.

Thinning out the pepper tree branches in the citrus belt at \$3 per tree is a remedy proposed for the citrus scales which breed in them.

The Capay Almond Growers' Ass'n on June 22 elected W. Naismith president and C. C. Barr Sec.-Treas. They took in nine new members at that meeting.

The June 1 estimate of the Florida citrus crop by U. S. Dept. Agr. is 68 per cent of normal and bloom scattered. Some orchards have been blooming for six months.

The Corning Olive Growers' Ass'n met last Sat. night to hear Market Director Weinstock's views on the proposed State Olive Growers' Ass'n. Jas. Mills also urged co-operation.

The Arbuckle-College City Almond Growers' Ass'n has let the contract for building the first unit of its new hollow brick warehouse. It is to be finished by Aug. 15 at a cost of \$2315.

Caprifig trees swarming with the wasps which are necessary to Smyrna pollination were about to be cut down by a grower in Merced county because the fruit was always "wormy." That is a most valuable characteristic of caprifigs.

Eighteen orange growers of the Palermo District have formed the Palermo Citrus Association, and will ship their crop this year through the Superior California Fruit Growers' Exchange, which is a member of the California Fruit Growers' Exchange. About eighty carloads of fruit are represented in the new Exchange. The Association has taken over the packing shed operated last year by the Butte County Citrus Association at Palermo.—Oroville Register.

GRAPES AND SMALL FRUITS.

The first crate of Fontainebleau grapes was expressed from Vacaville June 23 to New York.

More berries have been shipped from Sebastopol to date this season than to date any previous season.

Sebastopol Loganberries are estimated by I. N. Cable to have netted in the crate \$60 per ton, Mammoths \$70; outlook for Lawtons fine.

"Our association shipped 500 tons of Loganberries into Eastern markets, have delivered 350 tons to the cannery, 112 tons to the juice factory, and we have no doubt that the two other canneries buying in our district have obtained at least 200 tons."—Manager I. N. Cable, manager Sebastopol Berry Growers.

GRAINS AND FIELD CROPS.

Butte county rice growers seem to be troubled with dam tamperers.

Some 60 big harvesters have been operating in the Tracy section.

Bean supplies are running out three months before much of the new crop will come in.

California Garden - Making

August and September are the months to begin the ALL-THE-YEAR Garden Making of California Valleys and Foothills.

A START IN TIME SAVES NINE FAILURES.

It is all the same with Vegetables and Flowers; but you must know how to do it; and this is what Prof. Wickson's books are for.

THE BATES STEEL MULE IN OPERATION

The Bates Steel Mule

(One Man Tractor)

---"Does Everything But Balk or Bray."

THE BATES STEEL MULE will take the place of more than 12 horses, pulling strongly all the time. It is THE TRACTOR for all farm work and only one man is required to run it! Let us show you how THE BATES STEEL MULE will pay for itself in less than one year.

EVERY implement on your farm can be run by THE BATES STEEL MULE and the operation is so simple that a fourteen-year-old boy can do the work. Write for our FREE CATALOG, which tells further interesting facts about this wonderful machine.

BATES STEEL MULE COMPANY

of California.
320 N. San Pedro St., Los Angeles

Stockton grain warehouses have been shipping new barley to New York for export to England.

Kansas has issued a call for 700 harvest hands at \$2.50 to \$3 per day and good board and "sleeps."

Over 4,000 sacks of limas have recently sold at \$6.60 at Oxnard, the highest price paid in 30 years except for seed.

Use of Delta corn stalks as shredded fodder for the sheep brought there to winter, is being agitated.

Delta onion acreage is estimated at 4000; short of last year by 1000. 2000 acres are said to be contracted for seed.

A Yolo grower of 600 acres barley and 200 wheat recently bought 10,000 sacks. About 12½ sacks per acre average.

More choice hay had been reaching San Francisco June 30 than before, and several lots brought better than the market quotations.

On June 27, Cal. had shipped 3602 carloads of cantaloupes according to U. S. Dept. Agr. The nearest competitor was Ga., with 134 carloads.

Alfalfa cut when ¼ in blossom, contains more digestible nutrients and holds its leaves better than if cut later, says the Washington Expt. Sta.

An Oakdale grower recently shipped a car of onions to Stockton at \$2.50 per sack. He has three acres from which he hopes to net \$2500 this year.

Hay buyers in Livermore valley are waiting for lower prices while growers hold for higher. Their crop is reported of better quality than its usual fancy stock.

Wheat varieties especially promising in yield, stiffness of straw, and baking qualities have been developed and are being offered to farmers for experiment, by Ohio Expt. Sta.

The State Sealer of Weights and Measures has found that hay baled in July may lose as much as 200 pounds per ton by September. Therefore weights taken in July are unlawful for Sept.

The Sperry Flour Co. recently shipped to Stockton 500 tons of Northern Bluestem wheat from Portland for milling. They also bought in one lot, 760 sacks of bright local barley for feed at \$1.25 per cental.

California follows Colorado in beet sugar production. Our output has steadily increased from 95,000 tons in 1906-07 to 195,000 tons in 1915-16. Next year's output is expected to be greatly increased.

Hay should be cured slowly enough so the moisture from the stems will evaporate through the leaves. Such hay will have better color and hold its leaves better, but should be cured fast enough to prevent mold.—Wash. Expt. Sta.

On June 1, there were about 84,000 tons of barley available for sale in Cal., out of last year's crop of 600,000 tons. Of this, about half had been sold, but could not be moved for lack of transportation.

A Sacramento county Chinese labor contractor recently took contracts to pick over 500 acres of Turlock can-

taloupes at 16 cents per standard crate and 7 cents for flats. This includes making crates, labeling, and hauling to shed. The price is several cents less than white men have been working for. Over 300 Chinamen will be brought in.

MISCELLANEOUS.

A soil survey of Santa Maria valley, Santa Barbara county, is being made by the U. of Cal. and U. S. Dept. Agr.

The Calif. Manufactures Census Bureau announces over 10,000 manufacturing establishments in Cal. in 1914, producing \$700,000,000 worth of goods.

A public hearing to consider tenta-

tive boiler safety orders of the Industrial Accident Commission will be held in Los Angeles July 13, 10 a. m. Union League Bldg.

The Southern Pacific Co. has given its employes who are members of the militia, leave of absence with same job on return, and full pay while absent to married men, ¾ full pay to those supporting families, and half pay to bachelors.

The average value of farm land throughout the United States in 1910, aside from buildings, was \$32.49 an acre, according to the census. In 1916, according to the Department of Agriculture, this value had grown to \$45.50, an increase of 40 per cent. Since the

total value of farm lands, aside from buildings, was returned in 1910 as \$28,475,000,000, the total increment since then must be more than eleven billions. The total agricultural wealth production in 1910, according to the Department of Agriculture, was \$8,498,311,413. The entire production of that year would not even pay increase in land values for the six years since then, to say nothing of the inflated prices that prevailed during the census year. And it requires as much expenditure of labor and capital to make the land productive, as it did in 1910. Is it any wonder that farm tenantry is increasing? — American Economic League, Cincinnati.

MID-YEAR MODEL 73 New Ideas

Mitchell
SIX

\$1325 f. o. b. Racine
26 Extra Features

700 Improvements

Made by John W. Bate, the Efficiency Engineer

The Mid-Year Mitchell is the 17th model which John W. Bate has built. He has worked out in those models 700 improvements, and all are now found in this car.

A Lifetime Car

What he has aimed at is a lifetime car. His genius is efficiency as applied to machines. And he says that a car should last like a watch.

Instead of heavy castings he believes in light steel made three times as strong. There are 440 parts in this New Mitchell which are either drop forged or steel stamped.

He believes in Chrome-Vanadium steel, and he uses a wealth in this Mitchell.

He believes in making each part as strong as need be, and then adding 50 per cent.

He believes in utter simplicity—in a car almost trouble-proof.

One result is this: One Bate-built Mitchell has run 218,734 miles. Six Mitchells have averaged 164,372 miles each. That is more than 30 years of ordinary service.

He has certainly come closer to a lifetime car than anyone else ever did.

10,000 Savings

In our factory Mr. Bate has made 10,000 savings. He has reduced our costs 50 per cent in five years.

He has done this by building a model plant—a plant which covers 45 acres. He has equipped it with thousands of time-saving machines. He has invested in this factory about \$5,000,000.

No other plant in the world could build this New Mitchell at anywhere near our price.

That is why, years ago, we brought John W. Bate here. And why we paid him his price to make this factory and car represent the last word in efficiency.

26 Costly Extras

You will find in this Mitchell 26 costly extras—wanted things which other cars omit. Things like a power tire pump, reversible headlights, cane-handle control, cantilever springs, etc.

There are 26 of those extras—each something you want. In other cars they would cost you an extra price. In the Mitchell they are free. All are paid for out of factory savings.

257 Cars in One

The Mid-Year Mitchell is the latest model out. It was not completed until after the New York Shows. Our experts and designers there examined 257 this-year models. And all the best new ideas from all of them are combined in this single car. It brings out 73 new touches in body, finish and equipment. It is the most complete car on exhibit.

Mitchell dealers everywhere are now showing this new model. It is the only car with all Mr. Bate's ideas. It is the greatest value ever given in a high-grade car. If you don't know your Mitchell dealer, ask us for his name.

Determining a Sire's Good Daughters.

[Written for Pacific Rural Press.]

One of the greatest handicaps of the purebred sire is the fact that too large a percentage of dairymen expect all of his heifers to be outstanding producers, not considering the fact that a certain per cent of all breeding operations are misfits.

This misunderstanding restricts the practice of weighing and testing the milk from each cow, which is the final measure by which every cow has to be judged intelligently.

Probably each breeder will have to decide for himself what percentage of his heifers by purebred sires are misfits, owing to the different conditions of feed, climate, and the minimum fat standard he has set for his herd.

In this connection the experience of O. T. Willsie of Humboldt county is of interest. His present herd was established by a previous owner many years ago, having been purchased as calves from a dairy in which purebred Jersey sires had always been used.

In this way the foundation was already rich in the blood of purebred Jersey sires. To intensify this breeding, purebred bulls were used on the herd till Mr. Willsie purchased them about three and a half years ago.

During this time, selection had been chiefly done on dairy conformation, persistency, and good judgment of the owners. This had established an ideal type of cow and a supposedly high producing one since the returns from the creamery were highly satisfactory. The herd comprised 37 head when Mr. Willsie bought them.

The first year after securing them they were not entered in the cow-testing association; but the second and third years they were; and while one cow has produced over 630 pounds of butterfat in a year, 12 of the 37 fell so far below Mr. Willsie's minimum of 350 pounds of fat for aged cows, that they were disposed of.

Thus it was shown in face of the fact that purebred sires and good judgment in selection had been practiced for a great many years, that still nearly 33 per cent of the cows had not been sufficiently benefited to warrant their further keep.

It would be natural to suppose that by culling out the poorer cows, without adding others in their place, the herd average would be materially improved but the testing has been still more beneficial than that; as it has allowed more certainty in enlarging the herd.

While the herd has been increased from the 25 original high testers, to 40 head at the present time, the average has continued to improve; and during May 14 cows averaged two pounds of fat a day or better. This leads Mr. Willsie to expect a herd average of 400 pounds of fat or better during the present year, an increase of 11 pounds of fat over the best previous year.

GOOD UDDER AND TEATS.

[Written for Pacific Rural Press.]

It is true that many good cows have poor teats and udder development; but it is also a noteworthy

fact that the experienced dairyman is invariably impressed with the cow having good-sized, well-placed teats and a nice square udder, when purchasing for his own use.

The writer recently visited a district where this matter of good teats and udders has received unusual consideration by dairymen generally, with the result that no matter how large or how small a cow may be, she always has comfortable teats for the milker, and presents a nice square udder to the visitor.

By inquiry among the various dairymen, we learned that the condition is entirely due to years of selection and breeding, the same as for butterfat. Cows with poor udder and teat development are apt to transmit the fault to their heifers; and in choosing the annual supply of heifers, those from cows with good development are the only ones retained.

The bull is also an influencing factor and as one dairyman remarked, "I never buy a herd sire that doesn't have good rudimentary development; for one bull can do more damage in this respect, than years of selection with the dams can improve."

CROSS BREEDING COWS.

To the Editor: Have recently purchased a Jersey cow whose sire is purebred Jersey, dam unknown, now bred to purebred Holstein bull; will her heifer calf prove a good producer, generally speaking, and is the Jersey-Holstein cross a good one as a rule, for farm purposes? Which bull should this cow's heifer calf be bred to in order to preserve the good results of the cross, a Holstein or a Jersey?—L. A. B., Oakland.

[Your calf is theoretically $\frac{1}{2}$ Holstein, $\frac{1}{4}$ Jersey, and $\frac{1}{4}$ unknown. Practically, it may show more characteristics of one breed than another. She is likely to be a good producer because of the pure blood of dairy breeds behind her. But this heifer's calves will have far more than even chances of showing reversion to scrub type and low production than she had. Crossbreeding purebreds often results in fine producing milk and meat animals, but they are no good for breeding because their offspring will have much greater tendency to revert to unprofitable characteristics. If you prefer Jerseys, breed the calf to a purebred Jersey bull and continue purebred Jersey sires on all the offspring, to get your stock near-purebred Jersey in the shortest possible time.

You can get the highest grade almost purebred cows sooner, however, by consistently using purebred Holstein sires since the calf has twice as much Holstein as Jersey blood to start with. High grades of any one breed are always more satisfactory in the long run than crossbreds.]

SPACE PER TON OF HAY.

To the Editor: How much loose tame oat hay well cured will a space 20x14x14 hold?—L. A. B., Oakland.

[Hay occupies 400 to 500 cubic feet per ton when well packed and well cured. If your space is entirely filled, the hay will probably weigh about 9 tons.]

60 Duroc Jerseys 60

Mossdale Farm, J. E. THORPE, Manager FRENCH CAMP, JULY 15

SANTA ANITA RANCHO ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. PRINCE GELSCH WALKER, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by KINTYRE LAIRD, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality the herd is unexcelled in the West. At the head of the herd is BANKER'S BOY, junior champion and reserve grand champion at P. P. I. E.

Anita M. Baldwin W. H. TAYLOR, Superintendent.
Santa Anita, Cal.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

Why Lower Hog Prices than Chicago?

To the Editor: Why is the San Francisco hog market one to two cents lower on good hard grain-fed hogs than Chicago? In the country where the farmer is not in position to ship his hogs in carlots to South San Francisco, the price is not 8 cents, but 5 1/2 to 6; and you have to stand in with the butcher to get that. We would be pleased to get an explanation from a San Francisco packer.—M. A. R., Tucson, Ariz.

[Answered by F. L. Washburn of Western Meat Co., San Francisco.]

[There are a good many reasons why the hog market in San Francisco is lower at certain times of the year than in Chicago. At the present time (June 24), top hogs in Chicago are selling at \$9.80. Our quotation here for hogs is 8 1/2 c, for stock weighing 150 to 250 pounds; and on hogs that yield 78 per cent, we pay 10c per cwt. additional on the live weight, and 10c for every additional 1 per cent.

Seldom, if ever, do we get any hogs that are equal to the hogs which are being sold in Chicago at 10c a pound.

Our percentages of condemned carcasses on straight weeks' killing, have been running of late from 5 to 7 per cent; and I feel safe in saying that at no other point in U. S. are the losses from tuberculosis so bad as from those hogs originating in the dairy districts of California.

Ninety per cent of the people of our State, especially in the larger communities, have the idea that ham and bacon from California hogs is inferior. You will find that almost every retail dealer will tell his consumer that he is handling nothing but eastern pork products. As a result, we are unable to sell the meats from our hogs at anything like as high prices as those secured by the eastern packers.

Another important point is, that the people of California eat very little fresh pork or fresh pork sausage. When you figure that at least 30 per cent of the eastern hogs are sold fresh at good prices, you can realize what a difference this means, where we are obliged to pack almost our entire production, on account of the very small demand for fresh pork.

Furthermore, the big centers of population in the East are enormous consumers of sausage and miscellaneous edible products, such as the tails, trimmings, spare ribs, cheek meat, ears, snouts, jowls, neck bones, etc., whereas, on the coast, we are not able to market these miscellaneous products to the same advantage.

Should Co-operate to Ship Carloads.—I realize that the small hog raiser is at a disadvantage in being obliged to accept prices offered by the country shipper or speculator. This can be avoided, if the farmers will get together, mark their hogs, and send a good man in with them to see that they are weighed separately at the Stock Yards.

Consistent Grain Feed.—In the East, practically all the hogs received in the principal markets are corn-fed. Here the hogs may have been fed grain for two weeks, four weeks, or two months; and they might all look about alike, and the percentage of inferior hogs included among those, for which we pay our full quotation, is much larger than

an eastern packer would think of receiving. I dare say that a big majority of the California hogs are shipped in unfinished; and it is a constant fight with us to get the shippers to hold back on light weight hogs.

We are starting a plan to pay shippers of good hogs a premium on the basis of yield, and on any good grain-fed hogs that yield 78 per cent, we pay 10c per cwt. premium, and 10c per cwt. on every additional 1 per cent of yield.]

BEATING A FLUCTUATING HORSE MARKET.

"Prices of inferior horses are never very far above the cost of production; and frequently they are considerably below," says W. E. Carroll in Circular 18 of Utah Agricultural College.

In this circular he gives a chart which shows the number of horses and the price on farms of the United States since 1867. This shows that the number of horses is less subject to variation than is the price, but a comparison of the two curves shows that the number of horses is not entirely independent of price. "For example," he writes, "1879 marks a low point in the price of horses, which resulted in a falling off of one million in numbers in 1882. Again in 1897 horses were worth a little less than \$32 per head. This decline began about 1890. The decrease in numbers began about 1893 and continued to a low point in 1899."

It is natural, he thinks, that the falling off in numbers should be a year or two later than low prices, because men cannot go out of the business, all at once.

The point he makes is, that at each low point in prices those breeding horses become dissatisfied and many get out of the business. In a few years the supply gets down to normal again, the demand brings up the market and men buy in at advanced prices. He believes the only wise course to pursue when faced with such a widely fluctuating market is to produce a rather steady supply of a product of the very highest grade, rather than to jump out when prices are low, and in when prices are high.

UDDER CAKED — LOW MILK FLOW.

To the Editor: When our 8-year cow calved three weeks ago, her udder caked and we could get only a little bloody, thick, nasty milk for several days. We bathed her udder with hot water and rubbed with hot grease 2 or 3 times a day for two weeks when it got all right. Since then she has given 3 pints each milking—is healthy and a heavy feeder. Can I bring her back to normal milk flow? We feed alfalfa. She does not care for bran.—C. O. B., Manteca.

[Udder troubles are hard enough to handle in the early stages, to say nothing of a chronic condition such as you have. Try the following: black antimony sulphide 3 oz., sulphur 1 oz., anise 8 oz., salt 2 oz., soda bicarbonate 2 oz. Give 2 oz. of this mixture twice a day in the feed.]

Buy Good Berkshires

AT CARRUTHERS FARMS' AUCTION SALE.
MAYFIELD, AUGUST 2.

Rival's Champion Best, 12893, the Premier Berkshire Sire.

Berkshire breeders and judges have pronounced this sale the greatest sale of Rival's Champion Best Berkshires ever made as well as the **GREATEST BERKSHIRE SALE EVER HELD IN THE WEST**

In selecting this offering we have picked the tops from over 200 head and of the 47 head catalogued 40 are sons or grandsons, daughters or granddaughters of the great boar of all boars, Rival's Champion Best. Never before have breeders in the West been offered an equal opportunity of purchasing, at public or private sale, such a large and select lot of Berkshires as we will send through the ring.

DAIRYING AND DAIRYMEN.

A dairyman writes from San Jose that he is having to pay \$16 a ton for alfalfa hay.

Thunderstorms cannot sour milk if it is kept clean and cool, says Mo. Col. Agr.

Frank Helm of Fresno has been buying cheap alfalfa hay and chopping or grinding it into good feed.

To keep milk sweet and safe for children, it must be kept clean, cool, and covered, says U. S. Dept. Agr.

The milking barn stalls at the State Fair, made very cozy officers' quarters for the soldiers recently encamped there.

The Petaluma Co-operative Creamery at Petaluma reports a diminishing cream supply due to early drying up of wild feed in the foothill districts of Sonoma county.

The LeBaron Estate recently completed a modern sanitary milking barn on their ranch near Valley Ford, Sonoma county; and have established a choice herd of registered Ayrshire cattle.

Manuel Marshall of Ingomar is putting up a new stave silo and modern milking barn and other dairy buildings. He is milking 200 grade cows and expects to erect two concrete silos next fall.

Bum wheat markets and lots of chinch bugs made Green county the richest per capita in Wisconsin because the settlers had to turn to dairying. There are now 39,000 cows in the county.

Norman B. Hunter of the Two Rock district, Sonoma county, is just completing one of the most up-to-date dairy barns in Sonoma county. Mr. Hunter has recently established a herd of registered Jerseys.

The dairy department of the Napa State Hospital is experimenting in the manufacture of fine grades of cheese. About 140 cows are being milked, and it is Manager Duffey's intention to exhibit a small herd at the coming State Fair.

Through a technicality, the new dairy law cannot constitutionally apply to milk products such as butter, but only to milk to be used as such, for human consumption. The defect will probably be remedied by the next legislature.

Creameries in Humboldt county are paying as high as 27 cents a hundred for skim milk which is being manufactured into casein. This is the highest price dairymen in that county have ever received for this product.

The Woodland Creamery has sold some stock to Wood, Curtis & Co. of Sacramento, who have been its selling agents. The directors have decided to pay 3 cents for fat over San Francisco butter quotations, and 3 cents still additional for fat in sweet cream.

The Spreckels Sugar factory is going to put up a beet pulp drier this summer, and for the first time, will have dried beet pulp. This will increase the available supply considerably. An estimated 60,000 tons dried beet pulp produced in the State last year failed to supply the demand.

SWINE BREEDERS AND STOCK.

R. K. Walker of Peters, Lamson and Walker has gone East to buy Durocs from the best herds in Iowa, Ill., and Ohio.

O. L. Linn of Modesto has purchased the interest of his partner,

W. A. Porter; and is selling all of their registered Holsteins, so he may spend all of his time raising more and better Poland Chinas.

Several cases of hog cholera are reported from Dos Palos where Miller and Lux and other raisers have suffered considerably. It is thought that the disease has been spread by the irrigation canals.

Peters, Lamson, and Walker of Devore report sale the last two weeks in June of 41 purebred Duroc sows and boars in Perris Valley, Lancaster, Palmdale, Daggett, San Fernando Valley, Holtville, and Devore. Their herd numbers between 500 and 700 head.

M. Bassett of Hanford reports that he is about sold out of Poland China hogs. He has a fine lot coming on, and has promised to consign 20 head to the Kings County Poland China Breeders Ass'n second annual sale.

The third meeting of the Duroc-Jersey Ass'n of Stanislaus County was held at the Board of Trade rooms, Modesto, July 1. They will hold a sale at the Livestock Show and Exposition in Sept. Not more than 40 head will be sold, and all of these must pass previous inspection by a disinterested committee.

BEEF CATTLE AND SHEEP.

A rabid coyote bit a man sleeping in his tent in Nevada the other day.

Two Mendocino year's clips were recently sold at 31½ and 32 cents, respectively.

George Wapple of Yuba City recently lost two calves by blackleg, and vaccinated the rest.

Cattle near Marysville were recently found with an unknown ailment, supposed to be weed poisoning.

J. W. Browning of Maxwell recently sold 150 beef range cattle to Idaho buyers for shipment to Kansas City.

At Cloverdale's spring wool sale June 21, 12 months' fleece brought as high as 31 cents and 8 months' sold at 27.

Dr. W. J. Young of Stockton recently bought 3000 acres grazing land near his ranch east of Lodi at a reported cost of \$100,000; and is said to intend raising cattle on the whole place.

The Nat'l Wool Growers' Ass'n has appropriated \$10,000 to the American Red Cross, if war with Mexico shall be declared. It was suggested that woolen blankets be furnished up to \$10,000 worth.

The Fresno stockyards plan seems to be evolved into a proposal for the railroads to put up stockyards for concentration of stock for inspection and bids of San Francisco and Los Angeles buyers. Chas. Gatewood, P. M. Bostwick, and R. Pryor were appointed to sign up 200 stockmen before operations will begin.

HORSEMEN AND HORSES.

Since the European war opened, 1,500,000 American horses and mules are said to have been exported.

Local horse and mule buyers around Winters have been busy getting stock together for inspection of Government buyers.

A bill to appropriate \$200,000 to engage the U. S. Government in breeding cavalry horses, is proposed by Senator Pittman of Nevada.

Fifteen broncho busters for the European allies were recently called for, through the California State Employment Bureau. The "busting" is to be done on this side of the water.

"Horses for cavalry should be rather small, decidedly hardy, and intelligent," says Senator Pittman of Nevada. "Such can be obtained by crossing the thoroughbred on western plains stock."

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

REGISTERED DUROC-JERSEYS—Fall boars and gilts. Weanlings sired by an excellent son of the 1020-pound Royal Munda. We have pigs sired by this boar weighing 240 pounds at 7 months, and out of line bred Golden Model, Crimson Wonder, Orion, Chief, and Colonel sows. For information write Haden Smith, R. 1, Box 84D, Woodland, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sex. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

GEORGE TOURNY, Manager.

RECORD HOLSTEIN SALE.

(Written for Pacific Rural Press.)

The Charles Jay Welch sale of registered Holsteins held at Los Banos June 28 was probably the largest and most successful breeders' dispersal sale ever held in this State.

One hundred and ten head, including a considerable number of heifer and bull calves, brought a total of \$30,785. The cows averaged a little over \$360 and the heifers \$225. The highest price paid for any animal was \$1500 for the two-year bull, King Segis Wayne Pontiac. The highest price paid for a cow was \$675 for La Polka Pietertje Spotfoot De Kol, a three-year-old. There was such a demand for young bulls that a number not originally entered were included in the sale.

The interest in this sale and the prices paid were somewhat remarkable in view of the fact that this

herd has no official records. It is, however, one of the oldest Holstein herds in the State; and both the herd and its late founder had excellent reputations.

Well Advertised.—The sale was well advertised, and buyers from three states competed with a goodly number of local bidders. The sale was exceptionally well managed throughout. Auctioneer Benj. Rhoades was assisted in the ring by Jas. McAlister, Jr., T. H. Davis, and T. E. Getzelman. The 110 head were sold in a little over six hours.

C. R. Bicknell, the largest buyer, bought 27 cows, 4 heifers, and 5 bulls, including King Segis Wayne Pontiac. A. J. Zaballa of Salinas bid in 16 cows and 5 bulls to add to his purebred herd in Monterey county. Jas. McGillivray bought 13 of the best cows, including La Polka Pietertje Spotfoot De Kol, at an average of over \$400 per head. H. J. Long, who has a purebred herd at Longheart Ranch, Fallon, Nevada, bought 4 cows.

E. B. Church of Sierraville bought 3 heifers and 2 bulls as a foundation for a purebred herd.

The largest local buyer was M. A. Marshall of Ingomar, who bought 5 heifers and 2 young bulls. Mr. Marshall has a large herd of grade Holsteins and has now established a foundation for a purebred herd. The Simon-Newman Co. of Newman bid in 4 young bulls. Other buyers were Goodwin & Sons of Ripon; A. G. Prader, Geo. Johnson, and A. L. Long of Los Banos; G. E. Neiderhauser of San Bernardino; J. R. McCabe of Ingomar; Cross & Riddle, Merced; White & Sawyer, Gilroy; J. Hamilton of Snelling; and H. J. Vogel, a well known breeder of Fresno.

TO SELL GOOD BERKSHIRES.

(Written for Pacific Rural Press.)

Those who are looking for Berkshire breeding stock will surely have an unusual opportunity of selection at the first annual sale of Carruthers Farms to be held early in August.

In order to make the offering outstanding in individuality as well as in breeding, Mr. Carruthers, the manager, has picked only the tops from over 200 head for his first sale; and every one of the 47 to be sold is of show caliber.

The opinion has been expressed by Berkshire judges during the past

spring that the reserve brood sows on Carruthers Farms comprise the choicest large band in the West if not the entire United States.

With but one or two exceptions all of these matrons were bought from Rookwood Farm, owned by C. F. Curtiss, president of the American Berkshire Association, at Ames, Iowa, the object being to establish a herd of highly-bred Berkshires that would command unusual respect at the P. P. I. E. livestock show, which the awards show they did.

The present offering is almost entirely made up of young stock, out of these Rival's Champion Best sows, there being included in the sale five exceptionally fine young boars and sows out of Forest Grove Laurel 2nd, a young sow of great quality as shown in the accompanying illustration. Of this number, two are sows and three are boars, one boar in the lot being entered at the State Fair

Five Cent Gains on Feeder Hogs.

[Written for Pacific Rural Press.]

How much should it cost to produce a pound of pork under average conditions in California? This is a question that is receiving serious consideration by a great many hog raisers, for it is the basis of all future enlargement of the swine industry.

B. E. King of Stanislaus county has had unusual opportunities of finding out what it costs to add a pound of pork on hogs weighing 100 pounds or over when feeding is started, as he is in the business of buying feeders and finishing them for the market.

In the first place Mr. King has found a great variation in the feeders he has purchased. Most of his stock hogs have come from mountain districts of northern California. Usually the requirements demanded of these stockers are that they be thin in flesh, weighing around 100 pounds, of good frame and from cholera free districts.

Once or twice hogs in fairly good flesh have been bought, but it was not possible to get such economical gains with them as with the thinner ones. Great care is taken in shipping these hogs as well as in buying them, to guard against cholera. All corrals and pens are thoroughly disinfected before driving hogs into them.

When the animals are unloaded at the ranch near Modesto they are immediately put onto concrete feeding floors, in a house 100 feet long, divided into five pens, with a capacity of 20 hogs to the pen.

Each pen is supplied with clean drinking water, a concrete trough for milk, and a self feeder, the latter being placed on the division lines and serving two pens.

The entire house is roofed, and both the feeding floor and wooden sleeping floor are drained by gutters. These are hosed off and kept sanitary at all times.

The ration being fed and the one on which the cost of adding gains for hogs weighing over 100 pounds at the beginning is figured, is composed of Brown Egyptian corn, ground barley, rice middlings, and molasses, mixed in the following proportions: three sacks of corn, three sacks of barley, four sacks of rice middlings, and 100 pounds of molasses.

This mixture is well stirred before feeding, in a large churn which had been discarded at the local creamery and which is run by a gasoline engine. After thorough mixing, it is put into the self feeders where it and all of the buttermilk the hogs will drink constitute the entire fattening ration.

In feeding out a carload of mountain hogs on this ration the past spring, Mr. King secured an average gain of three pounds a day for 30 days; and in 60 days was able to put on an average of 150 pounds per hog. At this rate of gain, he figures the cost per pound at five cents.

But his average cost per pound of pork sold from the ranch is considerably under that figure as he raises pigs in large quantities himself; and these are brought up to the hundred pound mark for less than five cents.

At present he has 70 brood sows and two registered boars. Except

during farrowing time, these sows and their pigs are run on alfalfa or barley pasture. They get all the buttermilk they will drink, and a light ration of the before-mentioned grain ration. This shoots them along rapidly; and at 100 pounds they are transferred to the fattening pens. They weigh at seven months, 175 to 200 pounds.

By acting as his own commission agent and shipping in carlots, Mr. King has been able to market his hogs in San Francisco with no loss other than shrinkage and freight. As his hogs are all grain fed, he secures the top price.

SHEEP ON MEADOWS IN NORTHERN CALIFORNIA.

To the Editor: How many sheep can be run per acre on the native meadow grasses of northern California or on timothy and redtop meadows?—K. S. S., Davis Creek.

[Answered by G. R. Wales, Milford, Lassen Co., Cal.]

[A man with a bunch of sheep can do better than run them on good meadow land. Cheaper range may be rented here, and the sheep will do as well or better. They want a certain amount of "browse," preferably on upland.]

Sheepmen here don't pasture the meadows, which are more valuable for hay. They range them in the mountains in summer; and either keep them on valley farms or drive them to the desert for winter.

One meadow might produce a ton per acre while another produces four; so the number of sheep would be variable if desirable.]

A 603-POUND GRADE COW.

[Written for Pacific Rural Press.]

Rosalee is the name of a grade cow 10 years old in the dairy herd of J. W. Coppini of Humboldt county. During 1915 this cow was entered in the Ferndale Cow Testing Association, whose records show that she gave 603 pounds of butterfat in a ten and a half months' lactation period.

"Nobody can pick her out of the herd as being the highest producer," says Mr. Coppini; and as a matter of fact she is far from the best looking animal in the herd, but that only goes to show how necessary the weighing and testing of milk is.

Rosalee was sired by a registered Jersey bull and her mother was sired by a Jersey bull out of a Durham cow. She is a good-sized cow, having likely inherited her size from the Durham grandmother. Her average test last year was 6.5 per cent. Since she was milked only ten and a half months, she probably has one of the highest records of any grade cow in the State and is an example of the possibilities of well-bred grade stock in the ordinary dairy herd and with ordinarily intelligent care and feed.

George V. C. Bacon has recently received some purebred Berkshire swine at his ranch in Sunnyvale that are intended as the foundation of a herd of breeding stock. They are from C. M. Talmadge; and consist of two sows of Matchless Baron-Robinhood strain and a boar of Belle's Champion-Royal Violet blood.

CHEAP SHADE AND WALLOW FOR HOGS.

[Written for Pacific Rural Press.]

There are still those who contend that a mud hole is by nature a part of a hog's life; but the growing conviction of progressive hog raisers is that a mud hole is dangerous around the hog lot, because of its usual filthy condition. There are many farmers and breeders who do not believe a hog needs any kind of a wallow.

But if a wallow is necessary, one that can be kept clean is surely preferable. On the River Bend Farm at St. Helena both concrete and wood wallows are provided, though Manager W. W. Everett prefers wooden ones.

These wallows are built seven feet each way, being located on the division lines of the pens. In this way, they provide a wallow three feet wide and seven feet long for each lot.

They are made ten inches deep, the wooden ones being of 2x12 boards. Drainage is provided for each wallow so they may be easily cleaned. A board roof covers the entire wallow, the fence posts acting as the center supports. With this arrangement the hogs have access to both shade and wallow and the lots are kept free of mud.

PUREBREDS CURED OF FOOT- AND-MOUTH DISEASE.

[Written for Pacific Rural Press by
Jno. P. Irish.]

The terror of the foot-and-mouth disease, which attacks all split hoof animals, is its supposed incurability.

This terror has been emphasized by the habit of the scientific men who destroy all infected animals, always to the loss and sometimes to the impoverishment of the owners.

I had followed the history of the recent outbreak of this disease in Illinois and Iowa, and recently made a pilgrimage to a herd that had it and survived it.

This is the prize Holstein herd of Col. French on his farm near Davenport, Iowa. The animals were at a stock show in Chicago, when they were attacked and ordered slaughtered by public authority.

Col. French immediately secured an injunction against the destruction of his property. This did not restore the control of his cattle to him. They remained in official custody, quarantined in most insanitary conditions; but under treatment of the Colonel's own veterinarian; and they all completely recovered. When I saw them, the herd was worth a journey from the coast to see.

Now it seems to me that it is worth while for our breeders and beef and dairy men here to keep in mind Col. French's experience, and be prepared to isolate and treat their animals for recovery, rather than submit in a panic to their destruction.

I am sure that Col. French will gladly put his experience at the disposal of our breeders here.

IMPERIAL SHEEP POINTERS.

[Written for Pacific Rural Press by
Glenn F. Smith.]

W. A. Feeler of Holtville, Imperial county, sold his dairy cows and bought 150 Merino ewes. He has 30 acres of alfalfa and 10 of milo and barley, which keeps the flock in fine condition.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

He gives us the following pointers:
For the small farmer, a high grade of stock is desirable. Then by conforming to local conditions, fair success is assured.

Plenty of shade and fresh water

must be provided. Sheep here must be sheared about three times per year. Breeders find it unwise to have lambs dropped too late in spring. Late fall is generally accepted as the better time.

Farm Poultry for Profit.

CONSTANT SUPPLY OF EGGS FOR MAIL TRADE.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

To always have eggs on hand at all seasons and all weather, looks too big a job for some people; in fact this one item keeps the many from venturing into that field of business. This makes it all the better for the few that hold on and try to fill the bill. Now the fact is that the difficulty is not nearly so big as it appears to be. The first requisite for success along this line is forethought. The man or woman must be able to plan out a line of work and do the things in order as planned. The mail order business calls for even-sized eggs of moderate size and weight; no little undersized pullet eggs will fill such orders.

Hence there must always be hens of mature age. They should be selected both for good-laying qualities and for laying even-shaped eggs. Hens that have filled these conditions as layers for one year or 18 months should be used as breeders at least two years more; and every pullet that is raised from them should be tested for the same qualifications before being accepted as a layer. For the first six months of the usual pullet's laying, the eggs would be too small for mail order trade; but if bred from good stock that have been selected for the above qualities, the eggs would be all right after the first batch was laid out. Twenty-two ounces to the dozen is a nice-sized egg for mail order business; and whatever is started with should be strictly adhered to, in order to gain and keep the customers' confidence.

Hatch Some at Christmas.—The next in line is the time to hatch. It won't do to hatch one or two months and trust those chickens for a constant supply of eggs; because all hens need and will take a vacation at times. There should be some chicks hatched about Christmas time. If these pullets are well fed, they mature very early because of the season, but they should be held back until of a fairly good size. This can be done by moving them around from one yard to another. About the time they get settled move them again, but keep up the feed to make good growth. It will be all right to let them commence laying in late June or early July. Then by August or September the eggs will be fit for

your business. These pullets should carry you over a great part of the molting season for the hens; and before they think of molting, the early March pullets will be on hand. These March pullets will not molt if you feed them right, but beware of tinkering with the feed bill; pullets are about as touchy as pretty girls; they don't stand much nonsense, sometimes.

Then there should be a good hatch for September. Chicks hatched in September and October molt early the following year and are great to help out the fall supply of eggs.

The whole secret is in planning ahead and attending to such details as feeding right. If your hens are doing well, be satisfied. Don't try to cut something out to save a few cents and thereby lose several dollars. Some people cut the feed as soon as eggs go a cent or two below the usual price. Then the supply of eggs is cut in two, and perhaps eggs advance suddenly. Then these people go in a panic to stuff the poor hens with all kinds of feed to get more eggs. Don't do these things if your aim is a constant supply of eggs for your trade. Better to be regular in both quantity and quality of feed and get a regular supply of eggs.

TOE PICKING.

To the Editor: In your issue May 13 you have an article, "Good Luck with Chicks." What is the "balanced feed" which prevents toe picking?—G. N. M., Santa Rosa.

[We have never heard of a balanced feed that would prevent toe picking. The statement in the article reads, "The balanced feed, plenty of light, and scratch litter are held responsible for lack of toe picking."

We have talked with large numbers of large poultry raisers; and here is a theory summarizing their opinions: Chickens like worms, and toes look like worms in the semidarkness of most brooderhouses. Chickens also go crazy over blood and become cannibalistic. When they try to get the worms which are really toes, blood sometimes comes, and you had better get that chick out. Plenty of light and scratch litter prevents the delusion. Out of the stack of opinions, fancies, superstitions, observations, and theories of various people, we gather that the thirst for blood may be partly quenched by feeding meat scrap, milk, tankage, greens, and a judic-

ious amount of salt.

Mr. Hennings grinds his own feed and varies it from day to day to keep his chickens with good appetites. He grinds oats and sifts out the hulls for litter in the brooder house. This litter retains considerable feed, and makes the finest kind of scratching to keep chicks' attention away from each others' toes. He grinds corn, also cracks some; cracks wheat, grinds and rolls barley and oats, also oystershells, and chops greens. A little engine and grinder does all this. A feed mixer works the ground stuff up with bran, oil meal, beef scrap, bone meal, shorts, charcoal, etc., as determined daily. These are bought in quantities and kept handy near the mixer. The grains are made up mostly of carbohydrates which should comprise probably 4-5 of the ration. The mill feeds, milk and meat have a higher proportion of protein; greens and oystershells furnish necessary minerals. Balanced rations have been talked frequently in our columns during the past six months.]

SWOLLEN JOINTS AND CONTRACTED LEGS.

[By Susan Swaysgood.]

Something is the matter with my chickens' legs; they draw up; and when they walk they drag their tails on the ground. The trouble seems to be in the joint just above where the feathers quit. These joints become large and stiff. The chickens eat well and appear all right other ways. Am feeding Egyptian corn, rolled barley, alfalfa meal, cracked rice, and blood meal. Gave some milk that was not very well curdled; but have quit that some time ago.—Reader, Oroville.

[Your chickens have rheumatism. The feed is too much one-sided. If you could give them plenty of green feed and less corn it would be better. If the sleeping quarters are damp, remove the hens to dry quarters. Unless you know the right percentage of blood meal to feed, that may be the one thing that is causing the trouble. Beef scrap is a safer article for the average person than blood meal, which is usually very high in protein. I would advise you to discontinue the blood meal, and give all the sour milk you can; never mind about the curdling. Give the chickens fifteen grains of iodide of potassium in one quart of drinking water. This is all right for both young and old. Give it in small clean dishes so that it will not be wasted. You can give this for a week; and if you have plenty of green feed, or sour milk, your chickens will soon be all right. Rheumatism is seldom fatal.]

POULTRY NOTES.

Walter Smith of Corning, is selling day-old chicks and pullets to Santa Rosa and Redlands.

A fair-sized flock of purebred Silver Campines and Buttercups is owned by Mrs. Gardener of Concord.

A. W. Foster of Hopland is cutting green alfalfa for 9,000 chickens with a new Acme cutter. He says it works fine.

Poultry producers of the State are considering organization under the plan of the Associated Raisin Co., with modifications as suggested by State Market Director Weinstock and the Poultry Producers' Promotion Committee.

The San Diego County Poultry Producers' Ass'n recently organized and incorporated to buy feeds by the carload. They claim to have

saved \$500 on the first two carloads (bran and fish meal). O. J. Bradshaw of Pepper Drive is president and B. H. Howard, Santee, Sec.-Treas.

The Tulare Co-operative Poultry Ass'n shipped \$5,650 worth of eggs and poultry in May, 1916. This is almost 100 per cent increase since May, 1915.

A correspondence course announced by the University of California, Division of Agricultural Education of the College of Agriculture, should interest poultry keepers: Indian corn has not been very extensively grown in California, yet there are many sections where the crop would yield remarkably well. Professor B. A. Madson has prepared the course on Corn Culture, keeping in mind California conditions, and he clearly explains the proper conditions for growing this valuable grain and forage crop. Among the topics discussed are: soils, seed selection, planting, cultivation, harvesting, and the varieties best suited to different sections of California.

For the immunization of fowls against chicken pox a method has recently been developed at the University Farm Experiment station that seems successful in every particular. The University of California manufactures this vaccine and sells it at cost to bona fide poultrymen. The present cost is less than a cent per dose (1 c. c.) while the syringes sell at \$3.00. The vaccine is furnished in two lots, 5 days apart, by the Veterinary division of the University at Berkeley.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R. R.? Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trappers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet—Vacation—1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

All of the Rural Press office force are given a two weeks' vacation each year and I am taking the advice I offered you and am spending mine in the southern end of the State. The climatic conditions here in Los Angeles are very different from the bay section—much less fog and more heat. Naturally that calls for a different type of dressing on the street—instead of seeing practically everyone in tailor-made suits as you see in San Francisco, you see white dresses with sport coats, silk dresses with no wraps at all or suits of white cloth or linen. The hats are much more summery looking, too; of necessity they must be or they would look out of place with the dresses worn.

The bathing resorts of our state are very largely located here, extending along the coast from Santa Monica south. They differ in type, some of them having many amusements, dancing and band concerts, which appeal to the young people while others are quite little places where the mothers of small children can go and take their babies and live out on the sand all day long in perfect freedom from dress and distractions. These beach towns would appeal to those of you who live in the warm interior valley, for the bathing is invigorating and the ocean breeze is refreshing.

In the opposite direction from Los Angeles are many foothill towns, all of them interesting in their own way—Redlands with Smiley Heights and Riverside with Rubidoux Mt. and the wonderful Mission Inn; Pomona with Ganesha Park and Ontario with its wonderful avenue all have a charm that appeals to a dweller in another part of the state.

Most of these towns and many others are situated in the citrus belt and are surrounded by orange and lemon groves. There are perfectly wonderful automobile roads leading out to all surrounding districts and if you are not fortunate in having friends who will take you, you need not miss seeing the sights, for Southern California is a network of electric roads that make sight seeing a pleasure.

San Diego, even without the added attraction of a Fair, is a beautiful city that you will enjoy visiting and the Fair is another point of interest.

Perhaps the thing I enjoy most in this "Sunny Southland" is riding through the orange grove districts.

Nowhere else in the State have I seen miles of orchards so beautifully kept, the roads bordered with trees—many times palms—and flowers everywhere. I could not help but wonder if the fabulous prices the orange groves sell for were not due largely to the beauty that appeals to the eye.

Rosabella Best.

PEDESTAL LAMPS.

The really new thing in lamps are the pedestal lamps that are at least five feet high with large silk shade, really quite similar in style to the piano lamp of twenty-five years ago.

AN OLD FRIEND IN NEW GUISE.

Force hot boiled Irish potatoes through a potato ricer; there should be three and one-half cups. Season with three tablespoons butter, one and one-half teaspoons salt, and one-fourth teaspoon pepper. Add two-thirds cup hot milk and beat vigorously. Turn into buttered dish, pour over one-half cup heavy cream and sprinkle with three-fourths cup coarse stale bread crumbs. Bake until crumbs are brown.

BABY BASKETS.

The use of wicker clothes baskets for the bed for a small baby is quite general. They can be covered with Swiss or scrim over a color, and with a pillow in the bottom make a very good bed, with the added advantage of being easily moved from room to room. But their use need not be confined to the house. The space in the automobile between the seats will hold the basket nicely and his lordship can ride comfortably without having to be held.

MIDDY BLOUSES.

All ages seem devoted to the middy blouse this summer. The little people wear them with pleated skirts in white or stripes and they are developed for women in white, stripes and pongee silk. A very attractive house dress might be made of chambray or gingham, with gored skirt and belted middy.

WALNUTS IN SALAD.

Salads of many kinds are greatly improved by adding a few English walnuts. Mix equal parts of English walnut meats cut into small pieces with crisp celery cut into dice and moisten thoroughly with salad dressing to make a particularly delicious salad. Chopped walnuts are also a delightful addition to chicken, lobster, shrimp and Waldorf salad. As a pleasing change add olives and walnuts chopped fine to potato salad.

COLORED LINENS.

Tablecloths with colored borders are being shown in one of the good shops. These are in yellow and blue mostly and bath towels have taken on a note of color. Some of them are cross barred in stripes of different colors and are very effective.

TEA WAGONS.

A small table with wheels and handle to push, popularly called tea-wagons, can be of wonderful help in setting and cleaning a table. You find them in the stores of mahogany or wicker, but they could do just as effective work if they were made at home from a small table with casters set in the legs.

DO YOU KNOW THAT

Light promotes cleanliness?

A clean mouth is essential to good health?

Headache is Nature's warning that the human machine is running badly?

Bullets may kill thousands—flies tens of thousands?

SCHOOL NOTES.

There are 21,200 rural schools in the United States.

California stands third in attendance in the twenty largest universities in the United States. Chicago comes off with the first honors and Columbia University second.

All honor to the country school teachers for they certainly send forth their pupils with a clear understanding of what they have been over in their school work and a thoroughness that calls forth most favorable comments from the teachers of any new school, be it city or town, where they may be enrolled. A city teacher said to me not long ago, "I never worry about children from the rural schools, in fact, I am glad to have them, for, as a rule, their work is very thorough and they seem to have such a clear understanding in regard to their school work. I suppose the pure fresh air and the lack of a hundred and one things that are going on all the time to take the minds of the city pupils from their work is responsible for it in a measure.

HOUSEHOLD HINTS.

When jam has become sugary and hard, place it in the oven until the sugar melts. Take out and put to cool. It will taste as good as freshly made jams.

A saturated solution of epsom salts is a good remedy for burns. Apply as soon as possible, and keep wet continually until the pain ceases.

Your crochet work can be laid down or handled without any danger of raveling if you will put a small safety pin in the last stitch.

The housekeeper will find pure baking soda a great help in the household. Used with cream of tartar, it makes an excellent baking powder. A pinch of soda added to boiling green vegetables improves their flavor and helps to preserve their green color. A little soda added to beans when cooking makes them soft and sweet. A pinch of bicarbonate of soda put in the milk that is slightly soured will restore its sweetness. Tinware boiled with some baking soda will assume a fine brilliancy and will not tarnish so easily.

I often wonder why we don't make greater use of the nickel-plated towel racks that can be bought for fifteen cents, in our kitchens. They look neat and are so convenient for towels and to hang other things on as well.

TOWELING.

Japanese toweling comes in many patterns in blue and white and is very effective for use in a bedroom for dresser scarfs and side draperies at the windows. It washes beautifully and is very inexpensive.

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

Cannas.—Would you kindly give complete instructions about the raising of cannas. They are my most satisfactory plant; yet I know very little about them, and am at times in difficulty. Frequently the edges of the leaves turn very rusty and I do not know the reason, nor how to enrich the soil. I do give them a great deal of water.

Cannas are very gross feeders and require very rich soil. In preparing a bed for them, I would use some bone meal, one pound to the square yard, and a heavy coating of half-rotted manure. Spade the ground very deep, and work the manure and bone meal in thoroughly. The manure is for immediate use, and the bone meal is more lasting. Cannas like a sunny location, and an abundance of water at the root; but if you wet the foliage on a hot day, the water settles to the edges of the leaves, and the sun scalds them. This is probably what made the edges of the leaves turn brown.

The young divisions of the plants should be set out in early spring; or you can grow most of the varieties true from seed. The seed should be frosted or scalded; both treatments have practically the same effect.

I have had the best success by scalding. Drop the seeds in boiling water, and you will hear them pop. Use the seeds for planting that have popped. When you do it, you will understand what I mean. Another way is to cut through the outer shell with a sharp knife—but it is a much slower method.

Plant the seeds in rich sandy soil about one inch deep. After they are up large enough to handle, plant in the prepared blooming beds. Canna beds should be removed each year, the old plants dug up, the beds thoroughly enriched, and the small divisions replanted.

At this time of year if the beds were not enriched in the spring, I would scratch in around the plants, bone meal one-half pound to the square yard, and then mulch them with two or three inches of half-rotted manure, manure that most of the heat has gone out of. Water through this manure. You can also apply a light dressing of chicken droppings on top of the mulch after a week or two. Do not use much, as it is very caustic and might burn the roots.

PICKLED WALNUTS.

[Tested recipe secured by Miss Lillian D. Clark, University of California.]

Gather them when young enough to be pierced with a pin. Put them in strong brine, and leave them seven days, changing it every other day; then take them out, wipe them dry, and pierce them with a large needle in several places. Cover them for eight hours or over night with cold water, then drain and put in jars.

Take enough cider vinegar to cover and to each gallon allow 12 beads of mace, 1 cup sugar, 36 black pepper corns, 36 cloves, and 1 tablespoon allspice. Boil 5 minutes and pour hot on the nuts. Repeat twice, three days apart and tie up.

TOMMY'S ARITHMETIC.

Hippity-hop, hippity-hop,
Down the street to the candy shop,
Striped sticks in a big glass jar,
Tommy Taylor's favorite are.
"Six for five," said the candy man.
Tommy to subtract began:
"Six for five, and five for four,
Four for three," he counted o'er.
"Three for two, and two for one,
One for nothing"—the sum was done.
"Please, Mr. Candy-man," said he,
"You may give the 'one for nothing'
to me!"

And so surprised was the candy man,
He gave it to Tommy, who turned
and ran;
But should you try this trick, my
dear—
It wouldn't work out that way, I
fear.
—Dora Marchant Conger, in
Little Folks.

JUNIOR'S REVOLT.
(A true story.)
[By Mary Wells.]

Junior was ready for bed. It had
been a busy day. He had helped
mother water the flowers, trudging
up and down the garden paths with
his little red sprinkling pot. He had
ridden to the corner with the ice-
man, perched high on the seat be-
hind the big bay horses. He had
helped little Mary next door make
mud pies under the lilac-bush in the
garden. He had run races with old
Bruno until both he and the dog
were tired. Yes, Junior was quite
ready for bed.

The windows were open, so that a
little breeze stirred the white cur-
tains. The smell of the lilacs drifted
in. A robin chirped sleepily from
the elm-tree outside. Junior's clothes
were spread neatly on a chair be-
side his bed, his little sandals stand-
ing at attention beside the chair.
He had said his "Now I lay me,"
and with a sleepy yawn had turned
toward the little white bed, the side
of which was invitingly open, when
his mother spoke. "Run across to
the bathroom, Sonnie-boy, and wash
your hands. They're all sticky."

Junior looked at the dirty little
hands, then without a word kept on
his way to the bed.

"Didn't you hear, Junior?" His
mother's tone was surprised. "Go
wash your hands."

Already one knee was on the side
of the bed. Junior shook his head
so hard that every little curl bobbed
separately, then he opened his lips.
"No," he said firmly.

Just at this moment a step re-
sounded on the stairs, and his father
entered the room,—big, merry
father. He was quick to see that
something was wrong. "What's the
matter?" he asked. He looked from
Junior to his mother.

"Junior has refused to obey me,
Franklin. He will not wash his
hands." The tone was sad.

The father looked at his small son
gravely. "In this house, Junior, peo-
ple have to mind your mother.
What she says goes. People who
don't do as she says don't belong
here."

Junior hesitated. Slowly he drew
down his knee from the little white
bed; slowly he turned toward the
door. His mother looked toward her
husband with an expression of relief
in her pretty gray eyes. But Junior
did not go across the hall into the
bath-room. Instead, he walked
steadily down the stairs, through the
big hall below, down the piazza steps,
and out into the night.

The father looked at the mother.
"By Jove!" he ejaculated. "By
Jove!"

Out in the garden it was dark.
Shadows were everywhere, queer,
moving shadows, shadows where all
sorts of strange wild beasts might be
lurking, ready to spring out upon
little boys,—little boys who would
not wash their hands. Junior
trudged on. The gravel in the broad
path hurt his feet, and once he stum-
bled over a big stick. A lump came
into his throat. One dirty little fist
went to his eyes.

All of a sudden he heard stealthy,
creeping footsteps behind him. His
heart beat fast with terror. Then a
cold damp nose thrust itself into his
hand. Trembling with fright, Junior
looked down; then he gave a little
cry of joy. It was Bruno, his dear
old playmate Bruno.

But what was Bruno doing?
Steadily he tugged and pushed until
he had pulled Junior around so that
he faced the piazza steps. Then,
Bruno still guiding, the two went up
the garden path, Junior clinging with
both hands to the old dog's shaggy
neck.

At the foot of the steps the mother
was waiting with outstretched arms,
and Junior walked straight into
them. Two sticky little hands clasped
her close.

"I will wash my hands, mother,"
he cried. "I will."

The father patted old Bruno's
head. "Good old fellow!" he said;
then he put his arms around Junior
and his mother and the three went
up the piazza steps, while Bruno,
wagging his tail, trotted slowly off
to his kennel behind the house.

Half an hour later, in his white
bed, Junior was sleeping peacefully,
a smile on his face. In his kennel,
Bruno lay, his head on his out-
stretched paws. Now and then he
opened his eyes and blinked lazily
at the moon over the old elm. The
revolt was over.

INDIVIDUAL MEAT PIES.

In your Home Circle Page May 27,
was an article, "Another Pork Pie
Recipe," by An English Subscriber.
It should be good and those who try
it out will be more than pleased
with it.

I would like to ask the same lady
if she could give a recipe for making
meat puddings, individual ones that
are enough for one person, the same
that are sold in the cook shops in
the cities in England. A pudding is
made in a basin for a family, and
wrapped in a cloth and tied, then
placed in saucepan and boiled. Could
puddings be made in very small
basins enough for one person, and
steamed or cooked in some receptacle
that would do away with the cloth
wrapping? I have seen plenty of
them served in the cook shops, but
do not know how they were cooked.

A meat pudding properly made
and thoroughly cooked does not spoil
if hubby or the boys are detained on
the road; for the longer it cooks,
the better it is. The meat becomes
more tender and the juice is retained
in the pudding. It is another way
of utilizing some of the inferior cuts
of meat, such as beef chucks. When
a person has been working hard,
there is nothing more savory or sat-
isfactory, and should certainly be
listed among the good things to eat.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

San Francisco, July 5, 1916.

WHEAT.

New crop California club and Sonora wheat are offered in limited quantity on the spot at the figures quoted, with trading still rather slow. Northern grain is scarce here, as the waterfront strike holds up shipments.

Sonora Wheat\$1.67 1/2 @ 1.70
Northern Club\$1.70 @ 1.72 1/2
Calif. Club, ctl 1.67 1/2 @ 1.70
Northern Bluestem. 1.82 1/2 @ 1.85
Northern Red 1.80 @ 1.90

BARLEY.

There was no trading over the week end, but the spot market shows a little more strength, as a great deal of shipping and choice feed are going East by rail, some of it for export, and the decline of shipping rates gives a better outlook for export business.

Shipping, ctl.\$1.37 1/2 @ 1.40
Choice Feed, ctl 1.32 1/2 @ 1.35

OATS.

New oats are still in rather light supply, but there is not enough demand to cause any great firmness in the market. Some re-cleaned red oats, suitable for seed, are held at an advance over ordinary offerings.

Red Feed\$1.40 @ 1.45
White 1.50 @ 1.60

CORN.

There is very little feature to the local corn market, as trading in Eastern is limited, and no great amount of Egyptian, etc., is passing through this market at present. Values are unchanged.

Eastern Yellow, ctl..\$1.85 @ 1.87 1/2
Milo Maize 1.40 @ 1.45
Egyptian 1.45 @ 1.50

BEANS.

The only change in values this week is a rather sharp advance in blackeyes, which did not advance last week, but have gone up in sympathy with the general market. Everything on the list remains very firm, as the recent jump and the evident shortage have caused buyers generally to look out for their requirements for the rest of the season, and there is quite a strong demand. Sales, however, are falling off somewhat, as stocks are getting down to very narrow limits.

(On wharf, San Francisco.)

HAY.

Arrivals continue moderate, owing partly to lack of local demand and partly to shortage of cars, a good deal of the hay coming from Bay and river points by boat. Business is decidedly dull nearly everywhere at present; locally, consuming demand is less than at times in the past, and practically all export and coastwise shipping is stopped by the waterfront strike; and dealers, in an evident attempt to bear the market, say that the consumers are holding off in expectation of lower prices. The bearish tactics are also noticed in the country, as no buyers have yet appeared in several districts. This, also, may be partly due to the difficulty of shipping to other markets. Notwithstanding this dullness, the new hay is very firmly held in most parts of the country, where the shortage of the crop is well realized, and in many places good hay is held at much higher prices than those here quoted. Several prominent districts, such as Sonoma county and the country between Livermore and Tracy, have a very short crop; while in San Joaquin county generally the crop is poor. The feed everywhere is extremely short, as a result of which most stock and dairy districts will have to buy a great deal of feed. Napa and Humboldt counties are already in the market. Alfalfa finds a

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, July 3, 1916.

The Eastern movement of Bartlett Pears is at its height and the fruit is of excellent quality and bringing good prices. The market should remain steady; as the pear crop is not over 70 per cent and only about half of it will be shipped East, the balance having been sold to the canners at \$45 to \$52.50 a ton.

Sacramento river Bartletts will be pretty well cleaned up by the 15th of the month and Placer County, with the exception of Colfax, will probably continue to ship until July 20 or 25. The mountain Bartlett crop is light and of good quality and as the Washington and Oregon pear crops are also light, late California Bartletts should bring fancy prices.

Thompson Seedless and Malaga grapes are moving from Imperial Valley. The quality is only fair, berries being not up to the usual size.

The following prices have ruled for the week:

ready market at high prices, and grain hay is expected to be unusually firm as the season advances.
Wheat, No. 1\$12.00 @ 13.50
No. 2 9.00 @ 11.50
Tame Oats 11.50 @ 14.00
Wild Oats 10.50 @ 12.50
Barley 10.50 @ 12.50
Alfalfa 10.00 @ 13.50
Stock Hay 7.50 @ 9.00
Straw, per bale25 @ .40
Nicholls Loomis Company quote hay to producers at the following prices: according to quality, f. o. b. Los Angeles, June 29.
Barley Hay..\$10 to \$14.00 per ton
Wheat 10 to 14.00 per ton
Tame oat... 12 to 16.00 per ton
North'n Alf... 11 to 13.00 per ton
Local 12 to 15.00 per ton
Stock Hay ... 6 to 9.00 per ton
Straw 5.00 per ton

Prices to consumers \$1 to \$3 per ton higher according to quantity ordered, delivery, etc.

FEEDSTUFFS.

No beet pulp is offered at present, and alfalfa molasses meal is out of the market, as alcohol distillers are taking all the molasses. Some extra fine middlings have come in and are held at an advance, and rolled barley also is a little firmer.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet pulp, per tonNominal
Alfalfa Meal, per ton. 17.50 @ 20.00
Bran, per ton 28.00 @ 29.00

DECIDUOUS FRUITS.

Arrivals before the holiday were rather light, and with some extra buying the market was quite strong. While more stock is coming in now, some lines still show some firmness. Currants and blackberries, and the best lots of strawberries, are somewhat higher, though a good deal of ripe stock has had to be sacrificed. New apples are arriving more freely and in greater variety, and have found a very fair demand. A good many crabapples are also appearing. Choice wrapped Bartlett pears sell readily as high as \$2 per box, and some other varieties bring \$1.50. Attractive apricots are in light supply and firm at an advance, and peaches also show some firmness, though much of the stock is moving in large packages. Figs also are higher, with lighter offerings of the black variety. Nectarines are beginning to come in. Plums and prunes of various kinds are offered freely at lower prices. Watermelons are easing off a little, but cantaloupes have advanced sharply, with light arrivals. A few Fontainebleau grapes are offered.

Currants, chest\$3.50 @ 4.50

DRIED FRUITS.

The top figure on new crop prunes has been marked down a little, as most of the local packers are unwilling to pay over 5 1/2 c., though apparently they are getting little fruit at that figure, and there are probably some sales being made at 6c. Aside from this there has been no change in the local quotations, and the market as a whole remains decidedly firm, with apricots and peaches in too much demand for canning or Easter shipment to warrant any concession on the dried fruit, even though the consuming demand may be curtailed. There is little doing in apples and pears at present, but the old stock is pretty well out of the way, and the decline is expected. Any figs available are in great demand, as the country is depending on California

Special Livestock Market Report.

Cattle. The local situation has not improved in retail consumption; and a consequent reaction is still felt in buying circles. The country demand for dressed meat is also depressingly short, country butchers finding it easy to pick up plenty of cattle cheap and consequently doing their own killing. Some few feeders are being bought; but so far, range conditions have not warranted any large offerings. The Portland market has been somewhat improved, values running fully 25 cents higher than the week previous.

Sheep. Plenty of sheep are arriving to take care of the none too brisk trade, a few Nevada lambs finding their way to market occasionally.

Later in the month there will be plenty of lambs arriving from Red Bluff and other Tehama county points. Values remain as quoted last week.

Hogs. Market here unchanged except a slight falling off in receipts. No heavy runs are expected now till October 1; and packers are continuing to empty their cellars. Portland reports a "snappy" market, closing strong last week.

Wool. Prices stand as for some time past, being quite steadily held. Local dealers say the spring clips are pretty well cleaned up, and there is little interest in the market until the fall shearing starts, which will be in a few weeks in some sections.

or its entire supply this year, and normal requirements are about three times as large as the crop. New seedless raisin prices should be out by the time this appears. The New York Journal of Commerce says:

"Thus far it seems to be a standoff between the packers, growers and jobbers in all lines of dried fruit, with if anything the advantage slightly in favor of the growers. California prunes are very firm and in some instances a trifle higher in price. Buyers have not yet interested themselves in futures to the extent of anticipating their requirements, but, according to the belief among members of the trade here, the time is not far distant when they will have to place their orders. The chief opposition to prices comes from jobbers who fear that the retail trade will be seriously curtailed by high prices."

20-lb. box, 1916 2.75
Bulk, layers, 50-lb. box, 1916 2.75

CITRUS FRUITS.
Valencias in New York with 19 cars sold July 3 were slightly higher than last week, averaging \$2.80 to \$4.75; grapefruit \$2.25 to \$3.40; lemons \$2.40 to \$3.75. Boston took even cars Valencias averaging \$2.60 to \$3.40; grapefruit \$3.85; lemons 3.20 to \$3.30. St. Louis handled even cars Valencias averaging \$2.80 to \$3.75; lemons \$3.40 to \$4.90.

Lemons and grapefruit are moving well in the San Francisco market, with oranges quiet as usual at this season. The latter have been marked up a little, however, in sympathy with other markets; and the inside figures on lemons and grapefruit also are somewhat higher.

Oranges, Valencias \$3.00 @ 3.50
Grapefruit 2.00 @ 3.00
Lemons, box 2.75 @ 4.50
Lemonettes, box 1.50 @ 2.00

HONEY.

There is no quotable change in values as yet, as shipments of the new crop are coming forward very slowly, and there is a good demand from the trade. Fancy extracted is very scarce, and the quotation is firmly held; and water white comb also is quite strong.

Water White, comb 13 @ 15 c
Amber 10 @ 12 c
Water White, extracted 9 c
Light Amber, new 4 @ 6 c
Dark 4 @ 4 1/2 c

NUTS.

During the week the first prices on new crop California almonds were quoted to the eastern trade. One party offered Nonpareils 18 1/2 c.; I X L's, 17c.; Ne Plus, 16c.; Drakes, 14 1/2 c. Immediately following this quotation, other shippers quoted Nonpareils, 18c.; I X L's, 16 1/2 c.; Ne Plus 15 1/2 c.; Drakes, 14c. Still another party quotes at slightly under either of the above.

It is generally understood that these prices are 'feelers,' as the trade seem to be waiting for the California Almond Growers Exchange to determine their prices, which according to the Exchange, will not be done until market conditions warrant, and possibly as late as September.

HORSES.

A few rather attractive lots of hunks and light drafters have ap-

PEARLED IN THE LOCAL MARKET WITHIN the past week, and received more attention than for some time past, though the market cannot be said to show any great animation, as the large local users are only moderately interested at this season. The demand for cavalry and artillery stock is of course strong, but most of the buying is done in the country. The general range of values shows no quotable change.

(Approximate values in San Francisco, based on auction sales.)
Drafters, 1700 lbs and up \$ 250
Drafters, 1550 to 1650 .. 150 @ 200
Chunks, 1350 to 1500 lbs 150 @ 175
Wagon horses, 1050 to 1350 lbs 110 @ 150
Green Mountain range horses, 950 to 1200 lbs 20 @ 75
Farm workers 50 @ 100

LIVE STOCK.

(Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F.)
Steers, No 1 6 3/4 @ 7 c
No. 2 6 1/2 @ 6 3/4 c

Imperial Valley, 7 mos. 14 @ 15c
Nevada 21 @ 23c

Dr. B. J. Cady recently advised Alameda county hog raisers not to depend on cholera serum entirely, but to clean up and keep clean, using disinfectants.

Almonds

Prices to the eastern trade on new crop California almonds are now being quoted by various speculative interests. One shipper came out with a price which was promptly cut by another, and as we write, we hear of a third price, somewhat different than the others.

It is the almonds of the growers who are not members of the Association that are being used to create this confusion and price-cutting—all of which has a tendency to lower the price level for all California almonds.

California Almond Growers' Exchange
311 California St., San Francisco.

Publisher's Department

"I find the edition of 'Second Thousand Answered Questions' simply crammed full of such interesting matter that no person interested in agriculture should be without this. Frederick G. Duncan, Dunedin, New Zealand." Mr. Duncan has been a subscriber to the Pacific Rural Press for a number of years. We have a special offer on this valuable book to subscribers only. Ask for it.

It pays to advertise in the Rural Press: "It may interest you to know that on checking up the sales at our auction on May 6, 80 per cent of the stock was sold to people who had corresponded with us before the sale as a result of the ad. we were carrying in your paper." Rancho Dos Rios, R. E. Watson, lessee, (Jersey cattle).

"Text-Book of Land Drainage" by Joseph A. Jeffery, has just been issued by The Macmillan Company, 66 Fifth Avenue, New York. Goes very thoroughly into matter of low yields of farm crops, too frequently to be traced to either over-drainage or the extended presence, at some time during each year, of excessive amounts of water, with the resultant sickly full stands, half stands, no stands, and drowned areas. The author gives a treatise on soils and comprehensive systems of proper drainage and maintains that if all lands on the farms were properly drained and given a chance to do their best, total yields and averages would be enormously augmented. Cloth bound, 256 pages, 95 illustrations. Price \$1.25.

"Fertilizers" by the late Edward B. Voorhees is another work just issued by The Macmillan Company, 66 Fifth Ave., New York. It explains the source, character and composition of natural, home-made and manufactured fertilizers, and suggestions as to their use for different crops and conditions. Cloth bound, 365 pages. Illustrated. Price \$1.50.

A recipe for raviolis, regular Italian style, is asked by F. M. J., Galt.

Bumper Grain Crops

Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa. No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels. Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription.

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

1 or 2 Row Beet Plow

**KILLEFER
QUALITY**

**KILLEFER
EFFICIENCY**

Was designed for the smaller grower where traction power was not available for handling the larger plows. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

We build this plow with either straight, sloping, or bent standards and with any style of wing or point required.

LOS ANGELES

The Peach's "Poor Relation."

Tenth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

[Written for Pacific Rural Press.]

WHY does the nectarine, born into the house of the peach with all the ancestry, endowments and consanguineal rights to the family property and honors, stand abjectly beyond the castle walls, unbidden to the feast of commercial popularity and prosperity and denied all satisfaction of pomological prominence which belongs to the species *Prunus persica*?

How Insignificant is the Nectarine?—Pitifully so. The late Professor Budd, pomologist of Iowa, did much roaming in the Asiatic habitats of our popular fruits. At a fair in eastern Russia he "saw tons of nectarines, fresh and dried, brought in by merchants of central Asia as they had been doing for hundreds of years." But this did not impress him greatly for he says the nectarine is nowhere a commercial product away from east Europe and central Asia "except in California, where it is almost exclusively used for canning and drying." Prof. Budd's last visit to California was nearly thirty years ago, if we remember correctly, and he then imbibed nectarine prophecy, which was abundant in those days, and lived not to see the outcome of it.

It seems that the nectarine, which started its drive out of its Asiatic birthplace later than the peach but still early in the Christian era, did revel in some glory at Roman banquets; did subsequently inscribe its sweet name in the pomologies of Europe, gaining new varietal titles in the open air of Mediterranean countries and under glass in Great Britain, but in no place engrafted itself securely upon public favor. Centuries after it started on its disastrous expedition westward from Asia, it unfurled its colors for commercial recognition in California, and is here, apparently, undergoing the final tragedy of its pomological life, for it is less in public thought and confidence than it was decades ago. The records of the day clearly show the relative littleness of it in

California, in connection with the peach, our greatest deciduous fruit, viz.:

	Peach	Nectarine
Number of trees	10,445,744	63,700
Acreage	144,888	637
Dried fruit lbs.	60,400,000	600,000
Canned fruit, cases	3,509,780	1,000

And even these little figures of the nectarine represent it when it was greater, probably, than it now is.

Why Worry About the Nectarine?—Well: it pleases us to worry—for

several reasons. First, we write so much of great things in California that we are fashions to preach about something small. Second, the history of the nectarine in this State is interesting and should be recorded. Third, experience with the nectarine serves to emphasize lessons in commercial pomology not yet too well learned. Fourth, why has the nectarine failed? Fifth, is there any hope for the nectarine?

Before proceeding to consider these problems, it should be noted that botany says peach and nectarine are one and the same distinguishable only by the whiskers, which do not count botanically, because the nectarine sprouts from the peach, and vice versa, both by bud and seed variation, and both are therefore *Prunus persica*. But we have already shown that peach and nectarine, though both equal to the same thing, are not equal to each other. So far as the interchangeability of the two goes, Darwin cites in detail the conclusive data upon which it is established. But of course all this counts for nothing pomologically, for every fruit has all degrees of value and of worthlessness within its own species. Just what external and internal characteristics seem to be involved in

Prolificacy of the Nectarine in California.

the great commercial difference of the two may appear as we proceed.

How the Nectarine Came to California.—It does not appear that there were any nectarines in the old mission orchards. They were introduced by the American pioneers and the most popular budded varieties from the English garden walls and glass houses were secured. In the open air of California they demonstrated the superiority of their new environment. In 1851 there was an exhibit of California farm products held in

EDITORIALS

THE WEEK.

EARLY announcements of the California State Fair of 1916 are now appearing in our advertising columns, and all readers should give heed to them. The State Fair of last year was overshadowed by the Panama-Pacific Exposition; the State Fair this year should be illuminated by the memory, and ennobled by the experience, of that world-beating event. We all certainly learned last year that the place for a good thing is not under a bushel and the general credit for the State and the special credit for an individual, through the public display of good things, was indisputably demonstrated. The non-exhibiting public also received a profound impression of the joy and profit in good industrial displays, which should cause this generation to cherish during its whole life a keener interest in all events of similar form and purpose. The result should be the building up of California State Fairs to a higher standard of excellence and a broader industrial significance than they have had for the last few decades—in fact, they should have in the future greater quality than they have ever had in the past. For we have not only a better appreciation of the great service good fairs may render to education, to industry and to improved living in every line, but we have better live stock, better fruit products, better field crops in higher lines, and we have better systems of agricultural manufacture and commercial handling of them than we ever had before. The announcement of a California State Fair ought to be a heralding to the world of opportunity to see and understand how a State of the greatest diversity of farming interests does more great things than any other State can do. Therefore, we say to all: do something good for this year's State Fair, for the glory of the State and your own!

PREPAREDNESS FOR LEGISLATION.

ONE of our associate editors is making a special air-flight study of the operation of the new fruit standardization law and the other is submarining in the turgid waters of the new dairy legislation. Our columns are showing and will continue to show, how the purposes and motives of the last Legislature, which may be generally regarded as commendable, did not produce altogether commendable results; which are either inadequate or sure to work hardship in operation—so far as the Attorney-General will allow them to operate at all. Nothing but such inquiry as our associates are making, supplemented by such contribution of fact and opinion as our readers, who are most affected, are presenting for public consideration, can yield such better general understanding of the problems involved which is essential to valuable revision of the laws which the next Legislature must undertake. And that reminds us of our old and continual contention that the closer legislation comes to the regulation of industry, the more important

it becomes that the legislators who undertake to respond to the public demand for regulation should know more of the subject-matter, the practical working and the point of view of those whose industry is to be regulated. So long as legislators were only required to ring changes on the Ten Commandments, the situation was different. Any honest, patriotic citizen, who has been well preached-at from his youth up would perhaps do well enough to define a man's attitude toward his Maker and to order him by law not to kick his grandfather, nor to swear, steal, kill, lie, or wish to run away with his neighbor's domestic appliances. But modern legislation aims to go much farther, and properly disposing and arranging its technical details, is far beyond the competence of even the traditional Philadelphia lawyer. It is altogether beyond the power of the ordinarily well informed and intentioned citizen to enact laws of special technical and industrial bearings because he knows nothing of the materials and methods he is aiming to regulate aright. Such a citizen is, however, competent to arrive at good laws when he is enlightened by fellow-legislators who do know the facts and conditions of the industry involved, and as a rule he may be trusted to act honestly and wisely. For these reasons it seems to us most important that the farming industries of the State should give particular attention during the next few months to the nomination and election of a sufficient number of legislators who shall add to general requisites of probity, acumen and force of speech, actual knowledge, born of experience, of the materials, methods, requirements and environments which are involved in production of wholesome foods and fair trade in them. Unless farmers do this in the public interest, all laws about farming are apt to do more harm than good.

TRANQUILITY OF CALIFORNIA.

WITH our Mexican brethren smiling at us while they are shooting each other; with the Germans coming into our Atlantic ports with "submersible merchantmen," with which they can outwit the watchful cruisers of the Allies by diving under them; with the outside Allies pinching the inside Allies, from the flats of Flanders and the steppes of Russia to the pinnacles of the Alps, we in California are not sufficiently grateful for our tranquillity—with our three meat-meals during the day and chicken tamales at midnight. Californians away from California are, however, trying to tell us how grateful we ought to be, and their longings for their California homes should make glad those who are not required to leave them. Here is what Mrs. Inez Haynes Irwin writes from the war zone where she has been doing a writer's duty for several months:

"I cannot fully tell you what California looks like to me from this distance and through the blood-red cloud that hangs between us. California looks a land of hope and plenty—of joy and happiness and health—a land where the social struggle, tense as it is, is a struggle in which victory of the biggest and highest kind is always in sight. And as for the ranch—that is still my idea of Paradise; it always will be—up, up, close to the sky in the highest ether that earth has to offer, while below stretches downward beautiful hills reaching at last equally beautiful valleys. No wonder you people do such brave and beautiful and noble thinking in such a clear and clean and noble atmosphere."

The joy with which Californians who are called to the high places of the earth return to their homes is testimony which we all appreciate by the feeling of it. George T. Marye, recently U. S. Minister to Russia, said this: "I have seen considerable of the world in the past few months, but of all I have seen, I think that no spot is so blessed for human habitation as California. And I am as glad to return to my home in California for its natural charm as I was sorry to leave Petrograd for its pleasant associations."

AVAILABILITY OF CALIFORNIA.

OF COURSE, some distant readers might get the idea, from the emphasis we place upon the glad return of the world-weary to California, that we are conducting here a sort of geographical rest-cure for those worn by activity in industry, in statesmanship, or by too energetic idleness. This

idea should resolutely be combatted. California is not a cozy nook in the shade for rest. California is a place in the sun for achievement, because all our natural endowments, our geographical situation, with its world-relations by land and sea, and the quality of our citizenship, all make for exceptional intellectual and industrial activity. It is not because of California's similitude to Araby the blest that Californians are so charged with love, loyalty and yearning. It is because California is, of all places, the best for getting on, in whatever line of honorable achievement one chooses for himself. It is because California, by most modern standards, stands highest in efficiency in noble human effort, and because California has advanced, beyond other States and countries, in understanding and enactment of the relative rights of woman to man, of man to man, and of true statesmanship to both and to the institutions which they create to serve and not to rule them. It is because in California men and women count, that we love our commonwealth, and this the world notes and admires.

And this attitude of Californians toward each other and toward the State, which is in part the gift of God and in part our own creation, is producing notable results in development, which increases the availability of California for the joy and use of the coming millions which our State can amply domicile and employ.

ROADS ILLUSTRATE AVAILABILITY.

TAKE the single fact of intercommunicability, which lies at the basis of development, is it not satisfactory that the report of the Highway Commission is that 87 1/2 per cent of the \$18,000,000 raised for the public highways is going into actual road building; that of the expenditure of \$13,746,396, in the building and improvement of 1320 miles of road, the cost of administration—meaning salaries, rentals and other expense accounts—is 4.41 per cent, and that other expenses for things not actually in the roadbed itself bring the total incidental expenditures up to 12.59 per cent—leaving 87.41 per cent in the labor and materials of construction. This, we believe, is coming nearer to getting the worth of its money than a State usually approaches in making a great appropriation.

Of course, the existing State highways are only the skeleton of the roads we need. It is quite as important to connect remote localities with them so that every farm-owner can ultimately drive out from his place upon a branch of the great system. And this will come. Looking towards it, Congress has just passed a law providing that during the next five years the general government will expend \$150,000,000 upon roads in the States, if the States will expend an equal sum. Of this amount California is entitled to receive \$2,336,250, which ranks her seventh of the 48 States sharing in government encouragement to road building. It is also very important to our State that the general government will expend a million a year for ten years on road within or adjacent to Federal forest reserves. The Western States were particularly interested in this phase of the question and successfully contended that the national government should protect and develop its own property. This will be a great force in increasing the availability of our mountain regions for settlement and for recreation.

CALIFORNIA IN THE WORLD.

OF COURSE the development of our agriculture, which is our particular hope and purpose, will be governed by the sum of the things which make California well peopled at home and well known abroad. To be great in food products of highest value we need demand which concedes large money in buying. Forty years ago our joy was in wheat and wool. Now we are buying more than half the wheat we eat and much of the wool we wear. We are buying too much of both and more than we shall in the future, we believe, and yet we have done well to get beyond these for our figure in world trade. Probably we never passed beyond fifty millions in value of wheat and wool product; now we are doing ten times that much with other products, and the future will be measured by our advance in trade, manufacture, and everything which makes for population at home and

popularity abroad. We in California will have more joy and pride in California as California wins larger place in the eye of the world. To this the Panama Expositions have contributed and the Panama Canal will contribute. To this also our bustling overland railways will contribute. Last week the first steamer of a new line brought a million dollars' worth of rubber from Singapore to San Francisco and transhipped it from this city to New York on twenty Southern Pacific cars running on an expedited schedule. The world is in a hurry for rubber nowadays. Usually, perhaps, it could float slowly through the canal and up the Atlantic coast, but trade is always apt to get in a hurry about something, and our availability in ships and rails as complementary factors in the world's work will be of inestimable value in our development. But the opening in San Francisco of central coast offices of the line to which this rubber-pushing steamer belongs is important. The new line belongs to the East Asiatic Company, one of the greatest commercial organizations in the world, owning plantations in the Dutch East Indies and operating a large fleet of steamers, which will ply from Copenhagen, via the Panama canal, to San Francisco, and thence to Tokio and Yokohama, running one of its biggest steamers into our port each month. This will be a new outlet for California products—striking the great continuous consuming belt of North Europe and Asia at both ends, by direct shipment.

CALIFORNIA SHIP BUILDING.

BUT great as is the advantage to us of the running in of the world's ships, the building of ships in California for the world's running is even more important, perhaps. While the Danes are doing the former the Norwegians are doing the latter. In Oakland there is now being finished a 7000-ton ship, at a cost of nearly \$900,000, for R. Stolt-Nielsen, one of the most powerful shipping interests in Europe, with headquarters in Norway, and it is to be one of a great fleet of steel freighters to be sent by the Norwegian shipper to the four quarters of the globe. And it was an interesting tale told to a reporter by Captain D. G. Dietrichson, the representative of the Stolt-Nielsen interests. "The shipping business has so developed that the shipowners are crying out for places to build ships. And of necessity, through the war, this means America. That is why the shipbuilders have more contracts than they can handle, and the contracts keep piling up. The Oakland shipyards all have plenty to keep them busy and are enlarging all the time. The result will be one of the utmost importance, of course, for your harbor, as well as for other harbors of the coast."

It may be a far cry from a ship's whistle to a cow-bawl, but every rivet well set in a California shipyard adds value to every acre of good land in the State!

Transplanting Acacias.

To the Editor: I have had very poor success in transplanting acacia trees. I would like to know the best time to transplant them.—J. H., Sebastopol.

The best time is after the coldest rains are over and just before the new growth begins. The ground is then moist and warm. These conditions are to be expected from February to April in different parts of the State. The trees should be taken up with a ball of dirt. Though this is not absolutely necessary if the roots are kept moist, it makes moving so much more sure that the extra trouble is worth while.

Midsummer Corn Planting.

To the Editor: Is it advisable to plant corn at this time of the season, on a few acres of raw land with irrigation and which we expect to seed to alfalfa in spring? Also, what variety would be advisable and latest date?—W. S., Kerman.

Probably you would not get much Indian corn. Some of the sorghums (Milo, Kafir, Feterita, etc.) would do better and would give you some green feed until the frost cuts them down. The tillage and weed killing will help the alfalfa.

Helping the Beet Downward.

To the Editor: I take from your illustration on page 86 of second edition of your "California Vegetables," that you refer to non-irrigated beet acreage, and that the lower or third moist strata is or ought to be subsoiled; or will the rootlets of mangel wurzels penetrate silt loam without subsoiling? The plowing was about ten inch, with tractor disking.—C., Chico.

The illustration you refer to is intended to show rather a shallow soil over a thin layer of hardpan (or even a plow sole) with a good depth of good soil under this impervious layer. Its lesson is that if this impervious layer is broken up the tap root of the beet will make its own way into the benign subsoil. In such a case subsoil plowing is not needed unless it may be required to reach the impervious layer. If you do that the beet will do the rest, if it finds adequate moisture, and it does not matter whether the water has penetrated from irrigation or rainfall.

Local Areas of Bark Injury.

To the Editor: I am sending a sample of bark from our Tuscan cling orchard. We have 80 acres of Tuscans five years old and three trees affected in this way. The infection is on the north side, extending from near the ground about two feet up. The bark on the affected side is very tight to the tree while on the upper or south side the bark is natural. These trees were irrigated three weeks ago and will not be irrigated any more before the crop is off. The fruit on the affected side of trees is about three weeks in advance of other fruit. The growth is stubby although healthy in appearance. What is the trouble and is there any cure, and prevention?—L. C. N., Kingsburg.

What caused the local areas of bark injury we do not know. Whatever it was, it arrested sap movement in the affected area and the accumulation of thickening sap burst out in gum-masses, as it usually does. The branch which received its sap through this bark area, being denied normal pressure for continued growth, took on phases of maturing—ripening fruit, stopping growth, etc., and reddening of foliage may follow. If sap enough does not move to these branches from other avenues they may die later; if they can get enough in these ways they will survive. Cut around the dead areas of bark to healthy bark, remove the dead bark and paint or wax the uncovered wood to keep out checking and decay. The wound will be covered with new bark from the sides, if the rest of the tree remains healthy. Take off the prematurely ripening fruit and cut back the affected branches, painting over the wounds.

You Can Keep Him out of Your Sky.

To the Editor: The party that owns land next to me has planted gum trees all along the fence. These trees will do me a great deal of damage. What action should I take? Is there a law against planting trees near the line?—Reader, Haywards.

As we understand it a man can legally place or plant anything within the boundary line of his property, unless you can prove that it will be a menace to good health. If it should be a building the whole of it must be over his own property and you can compel him to saw off a projecting cornice or any other part which may cross a line vertical to the boundary line and thus trespass upon your sky. If he plant a tree so near the boundary line that its enlargement crosses that line you can compel him to keep hewing it off to that line continually. If branches cross the line you can compel him to keep cutting them back to that line. If you have a good enough lawyer he can probably secure action to compel your neighbor to keep the roots of his trees from trespassing upon your soil rights which extend to the center of the earth—but you would probably have to dig down and demonstrate that trespass is being done. The law punishes; it does not prophesy. For this reason you may not have legal recourse against the planter for what his tree may do in sky and earth trespass: the tree must do it to a demonstrable extent first. If your neighbor is a kindly, reasonable man he will probably remove the trees when you show him that you consider them a danger and a menace. If he is a hard man and disposed to stand upon his rights to plant what he likes inside of his

line (and you do not consider yourself a pretty good talker on your own account) get a lawyer to explain to him what he can be legally made to do to keep his tree out of your earth and sky. He will then probably conclude that it would cost him more to keep from punishable trespass than the trees will be worth to him.

Para Grass.

To the Editor: Would Para grass be advisable to plant in the soft land in Imperial valley? I have some land that is often flooded by neighbors' waste water, so that alfalfa is scalded out. Is there danger of Para grass becoming an undesirable pest?—L., Brawley.

Para grass (panicum molle) is a coarse grass giving much succulent forage in a swampy place, while it is not cut down by frost. During the frostless period it might serve you that way. But it is a perennial, and if it likes the region it may take a strangle-hold. Frank S. Earle, when in the Cuban Department of Agriculture, wrote thus of it: "Para grass grows best in wet, half-swampy places. It is as hard to kill as Johnson grass, and I regard it as rather a bad weed. Still, like Johnson grass, it is a fine thing in its place and yields enormously on lands that are too wet for anything else." As for Para grass in the Imperial Valley, Coit and Packard wrote of it, in University Bulletin 210, that it was introduced in Imperial Valley in 1909, and made remarkable growth in a few patches. It is hard to eradicate when started on wet land, but in an irrigated section it can be dried by withholding water and cultivated out. It can be cut every six weeks or so during the summer in Imperial Valley.

Distinguishing Sex in Dates.

To the Editor: Please tell how female dates are propagated and how they can be distinguished from the male dates.—L. C. L., Brawley.

The seedlings must disclose their sex by their bloom, and they should be held in the nursery row until they do this. They may do it in two years—sometimes they wait from two to five times as long. The male flowers have stamens and no pistils; the female, vice versa. But you can tell the male bloom by its bunchy appearance and the pollen which it throws down as it bursts the sheath. The female bloom is slimmer and discloses a bundle of strands as it opens—developing flowers along these strands and casting no pollen. When you learn this difference you can distinguish the plants nearly as far as you can see them. Remember, of course, that all offshoots or suckers are of the same sex as the plants to which they are attached. In their case, therefore, you do not need to wait for the blooming.

Transplanting Seedling Roses.

To the Editor: Seedling roses from spring sown seed are now 2 ft. high. Is it safe to transplant now?—P. K., Napa.

If the terminal buds have formed and the foliage yellowing indicates dormancy, you can safely transplant, providing you plant out in ground which you can irrigate to maintain fair moisture until the rains do it. Cut back about half the top growth. If, however, the foliage is still active, we would not move until later in the season, when dormancy arrives. You can, of course, stop watering and hasten dormancy.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., July 11, 1916.

STATIONS	Past Week	Rainfall Data		*Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	.13	.07	64	52
Red Bluff	0	1.00	0	104	60
Sacramento	0	.06	0	100	54
San Francisco	0	.03	0	80	50

San Luis Obispo	0	0	.01	78	46
Los Angeles	0	0	0	76	56
San Diego	0	0	0	70	58

The Peach's "Poor Relation."

(Continued from page 49.)

San Francisco and A. Williams, who had the honor of presenting a silver goblet to an exhibitor of vegetables and grains, made an address in which he roamed quite widely over the glories of California. Among other things he mentions the nectarine as "mingling with other northern and semi-tropical fruits in the luxuriant gardens of Los Angeles." The nectarine was then introduced before the advent of the gold-seekers by the earlier pioneers who established themselves in Southern California. Obviously several other fruits reached California in the same way.

Nectarines came direct from eastern nurseries to central California with other fruits (in 1851 probably), but they were not largely planted and in the announcements of local propagators during the next year or so they were bunched with apricots and plums at the ends of the fruit lists. And yet they showed distinctive excellence, contrasting with the old standards. W. N. Thompson of Suscol in the lower Napa valley had reached this conclusion as early as 1856: "We have produced apples this year, of beauty and flavor unsurpassed even in the far-famed state of New York, while the nectarine and apricot have been so improved by their removal to California soil as scarcely to be recognized as the same fruit."

As early as 1855 there were to be found at several nurseries in central California as many as 20 named varieties of nectarines, and in 1856 W. B. Osborne had ten varieties in bearing near San Gabriel, Los Angeles county. A. P. Smith, who is credited with establishing "the first general nursery of ornamental as well as fruit trees, two and a half miles north of Sacramento on the same side of the river about 1852," had in 1857 in nursery rows 35,000 nectarines of twenty varieties and 5,000 apricot trees of fifteen varieties. This shows the relative standing of nectarine and apricot in the prophetic pomological eye at that time. Doubtless this early abundance in propagation of nectarines was influenced by its relation to the peach which was planted vastly more largely than any other fruit, as shown in the special discussion of that fruit (Rural Press, May 27, 1916).

Perhaps the first large planter of nectarines in orchard form was G. G. Briggs of Yuba county, but he was a slow starter with it. Though he began planting peach and pear trees in 1851 and continued with other fruits he did not strike in with nectarines until 1855 and then planted 2000 trees. By 1859 he had 1000 acres of orchard fruits, including 49,500 peach trees, on the Yuba, Feather and Sacramento rivers, but there were never more nectarines than in 1855. These orchards were destroyed by the debris brought down by the flood of 1861, and Mr. Briggs did great things with fruits in other parts of the state, but we have no record that he grew any more nectarines.

California Seedlings. — With nectarines, as with other fruits, the

pioneers held that if varieties brought from other countries improved so much in California, certainly native varieties, born from the seed under California conditions, had a good chance of added superiority. This was a true conception, judging by the number of California seedling peaches, almonds, plums and cherries which are now leading in our fruit lists. We should probably have realized the same attitude with nectarines if the fruit itself had any climbing force in it—which it has never had. It is, however, interesting history that B. B. Redding planted a nectarine pit in his Sacramento garden in 1855 and in 1859 the fruit of the tree was pronounced "entitled to place in the list of approved varieties." The performance of the tree aroused wonder, as is shown by this almost apologetic account which was published in 1859: "The original tree is but four years old and yet, incredible as it may seem, it nevertheless positively produced last year one and a half bushels of fruit and this year the perfectly enormous quantity of over five bushels."

Other seedling nectarines were reported from time during following decades, but attracted little attention because the fruit itself was in the discard. The final tragedy of the seedling nectarines occurred in '90s when a grower at Selma produced a group of very large, white seedlings, superior to any of the old varieties, thought to be fit to reach the highest standards in both canning and drying, but after a few years of disappointment through public indifference, grafted over the trees to peaches and thus closed their career.

Thus it is shown that the nectarine had a fair show for achievement in California, by early introduction, by interest of pioneer planters and by exhibition of greater excellence here than elsewhere, and yet it soon fell, never to rise to commercial importance. How can this fact be accounted for?

Sweet Name and Smooth Cheek. — Probably much of the charm which this fruit has had for English-speaking mortals during several hundred years may be attributed to the name "nectarine"—which created the impression that it must have been a sort of breakfast-food or coffee-substitute for goddesses. Whence came the picturesque naming of the fruit in the English, does not clearly appear, for the French simply called it "peche lisse," or smooth peach; following the practice of the East Indians, who called it "moondla aroo"—meaning the same thing. It is possible that the fruit, as grown under glass in English fruit houses, did exhibit some delectable characteristics to which one might find some tributes if he had time to search the literature dealing with the life of the British aristocracy of the eighteenth century. This much we easily know: that the nectarines which came to this country during the latter part of that century or the early part of the nineteenth, bore names predominantly British. We are looking at one English pomology published in 1860 which describes

about forty nectarines, of which thirty-three have British names, five French and one American, but no discussion of the fruit is given by which we might learn why the British went in for it so strongly. Nor does Darwin, who gives much attention to the fruit because of its interesting biology, tell us why growers cared for it.

Neither is it clear, from any records at hand, that much advantage inhered in the smooth cheek of it, though one might imagine that grown under glass its almost translucent beauty might give it claim which the peach loses by its furry coat. But this smooth skin, which might have charmed the British, dispelled the American, because the curculio, seeking guardians for its offspring, avoids candidates with whiskers but chooses the nectarine freely, as though it were a plum. In California, where there is no curculio, a smooth peach would seem to be ideal, but the experience already cited shows that its smooth skin could not secure popularity for the nectarine in California fruit growing.

What, Then, Is the Matter with the Nectarine?—In the writer's judgment the real reason why the nectarine is little and the peach great in popularity, and therefore in commercial value, is owing to the different flavor of it. Why the nectarine, which may be either the daughter or the mother of a peach, or even the sister of a peach and sit beside it on the same branch, has always its own flavor, different and inferior to that of a peach, we cannot explain. Darwin does not undertake to explain it, and he is a wise judge for he does not hand down a decision on a point irrelevant to his determination of the fact of origin, and yet he does establish the fact of different flavor when he writes (on page 364 of Vol. 1 of his "Animals and Plants Under Domestication") these words: "Nectarines, even when produced from distinct kinds of peaches, always possess their own peculiar flavor."

What is this different flavor? Our earlier American pomologists note it in this way. Downing in his edition of 1845 says: "In flavor the nectarine is perhaps scarcely so rich as the finest peach, but it has more piquancy, partaking of the noyau or peach-leaf flavor." Downing evidently disliked to condemn this popular British fruit. Thomas, another American pomologist, writing in 1846, says: "The nectarine is usually inferior and has more of the noyau flavor than the peach."

It makes us smile to think of the combat these contemporary pomologists of 70 years ago must have had over their French; for, of course, noyau is the pit, not the leaf. Downing's retort probably was that the pit, or kernel, and the leaf of the peach have the same flavor, due to the same substance, and let it go at that, for, though in later editions he corrected the spelling of the word noyau, he would not do more.

This ill-flavor of the nectarine as compared with the flavor of the best peaches was early noted in California and may have had much to do with the pioneers' side-stepping of the nectarine. Redding's seedling nectarine, previously mentioned, was said (in the California Culturist of September, 1859) to have "a very delicate flavor for a nectarine, which to our taste is seldom found equal to the peach, though but a variety of it." The writer was evidently trying to do the best he could for this new California seedling which he desired to exalt, but his conscience compelled him to note its inferiority to the peach in eating quality.

Nectarine Handicapped by Acidity. —But this noyau or wild flavor of the pit which persists in nectarines, though it is inexplicable when growing from the same wood as an adjacent peach which has it not, is not, in our judgment, the most unfortunate characteristic of the flesh of the nectarine. In our opinion it is the sharpness of its acidity which even peaches which retain much pit-

SHURE-KIL SPRAY

TRIAL GALLON PREPAID FOR \$1.00

—A Profit Proposition
for every grower who wants better trees, better fruits, Better Profits. That's the Big Thing for You in SHURE-KIL SPRAY —it shows a tremendous profit on every penny invested.

flavor, do not possess. In an analysis of both in the agricultural laboratory of the University of California this result appeared:

	Acid.	Sugar.
Nectarine62	17.17
Peach24	17.00

That is, in this case, the nectarine had more sugar in its flesh and juice than had the peach, but it also had more than two and a half times as much acid, and that much excess acid acts fiercely on the composite flavoring of a fruit. Surely no argument is necessary to establish the preference of fruit-eaters generally for sweet fruit. The smile of satisfaction over a ripe peach, continuing to the very end of it, can be contrasted by anyone with the expressions of inquiry, wonder and finally the serious doubt of liking it, as its acid cuts his taste, is very common experience as one goes through with the eating of a nectarine.

But though the old Greek "nektar" applied primarily to vinous fragrance, such as might appeal to ethereal beings (for their divinities were not always assuming human form and raising Cain on the earth), even with the Greeks nektar signified honey and therefore impressive sweetness. In our notion, then, the English misnamed the fruit when they called it nectarine; for surely no god but old, scorbatic Mars could have had any use for the acidity of it.

But fortunately we have something much more definite on the subject than either our own philosophy or philology. It is from a well-known expert whose life study it is to know what people like and to give it to them, and his conclusion is that they will have sweet fruit. F. A. Dixon of Hunt Brothers Company kindly gives us his judgment as follows:

My experience in the canning business has shown that the trade requires the sweeter fruits, such as the peach and pear; or, to be more exact, fruits with the lesser amount of acid. The proportion of peaches to other fruits in canning is continually increasing. The peach is now 50 per cent of the entire pack and I believe the peach and pear will in time comprise 90 per cent of our entire pack. With other fruits, plums, nectarines, etc., I am satisfied it is on account of their excessive acid that their popularity is waning. I am sure that in the long run the sweeter fruits will prevail and supplant the others.

Why Canners Have Dropped the Nectarine.—In addition to his generalization of the movement of canning toward the sweet fruits, as given above, Mr. Dixon states a specific fact as follows: "We had almost forgotten that there is such a fruit as the nectarine. We have not sold a case of it for perhaps ten years; do not quote it in our price list and have no inquiries for it."

C. H. Bentley of the California Fruit Canners' Association kindly allows us to look at the nectarine problem from another point of view. He writes:

The reason why nectarines have practically disappeared from the list of canned fruits is because they are not good eating unless they are ripe and when they are ripe they will not stand processing. The trade is prejudiced because for many years the canners persisted in handling them too green in order to stand the processing with the result that the consumer rebelled. Nectarines should be an attractive item on the list, but the difficulty is that the average jobber wants a clear, transparent

syrup on his fruit. To attain this we have to pack them green. If they were packed ripe there would be a great deal of fibrous material floating in the syrup.

This is an exceedingly interesting indictment of the nectarines which have been grown in California and it is a good reason why more of them should not be undertaken. It is of course not a demonstration that this defect inheres in the nectarine as a fruit. Canners only use a few of the scores of peach varieties which are grown, and these are selected because of their canning quality. By multiplication and selection along the same line good canning nectarines could also be reached, but there is no inducement to do it which would appeal to anybody but a crank.

The Dried Nectarine.—For forty years this writer has exalted the beauty of the dried nectarine. When skilfully handled the product has always appealed to us as the most beautiful dried fruit California produces because of the beautiful pit-color in connection with the amber translucency of the surrounding flesh. This has always impressed us as handsomer than the opaque whites and yellows of the dried peach. But the sharp acid causes the interior of a man to withdraw the admiring gleam from his eye and to seek the complacent comfort which the well-dried peach produces in the same part of him. But as we desired a broader view of the dried nectarine than this we asked H. C. Rowley of the California Fruit News to give us of his knowledge of the attitude of the dried fruit trade toward this product, as follows:

I should say that no one, either packer, dealer or consumer, has any definite opinion of the dried nectarine as the industry did not develop sufficiently to find markets for itself. Some packers may have specific instances of complaints and loss some years ago, but they are all rather inclined to think now that dried nectarines, if obtainable regularly and generally, would be a desirable article when definite trade outlets are developed. It is the opinion of the dried fruit people in the San Joaquin, south of Fresno, where nectarines used to prevail, that the increased acreage, either being planted or contemplated, is likely to develop a reasonable and regular tonnage a few years hence. I do not find any packers of dried fruits who have any specific complaint over the nectarine situation other than the lack of regular and definite supplies on which to work up a trade.

On the whole, then, the prospect of the dried nectarine may still be considered hopeful, with some indication that the attitude is returning to the bright expectancy which some growers maintained from twenty to thirty years ago.

Nectarines in Eastern Shipments.—So far as our records show, the eastern shipments of nectarines in full carloads began with 5 cars in 1895; 1 car in 1896; 10 cars in 1897; none in 1898; 2 cars in 1899; none in 1900; 2 cars in 1901—and since then no separate mention; nectarine shipments apparently going in with "mixed and various." Of the eastern shipment aspect of the fruit F. B. McKevitt, who has been a grower, shipper and distributor of shipments for many years, gives us these interesting conclusions:

In my opinion the principal reason for the small planting and small shipment of the nectarine lies al-

most entirely in the fact that both tree and fruit are very tender. The wood of the tree is brittle and easily broken and the tree will not continue in bearing as long as the peach. The fruit is not safe to handle: its thin and tender skin makes it a poor shipper. The red varieties are fairly popular at the east and bring satisfactory prices when they arrive in good condition, but it is almost impossible to insure arrival in good order. Besides the fruit closely resembles the peach and there is no business so completely overdone in the east as peach growing. This has practically eliminated the California peach from the eastern fresh fruit market and it would tend to operate in the same way with the nectarine.

Mr. McKevitt is inclined to be a little bearish on eastern shipment of California peaches and is known to have greater faith in plums for that purpose, and may be right, but our eastern shipment of peaches is still running around 2000 carloads a year, about the same as for the last ten years, and we do not feel quite as he does about the future of it.

No matter how many peaches they grow at the east they cannot match the size and style of our fruit nor the earliness and lateness of its maturity. California can surround all they can do with peaches—but this is not a peach story.

Can We Have a Smooth Peach?—Mr. McKevitt thinks the nectarine is too like the peach: our notion is that it is too unlike it. Can we have a nectarine which will truly be a peach in flavor and sweetness, in canners' characters, in shippers' carrying endurance, etc.? Surely. The nectarine has not been bred, trained and selected to meet particular uses as the peach has. We have been trying, more or less, to get values from the natural wildness of the outbreaks. And all that can be overcome while retaining the smooth skin and whatever advantages there may be in that. It needs the thought and effort of the human mind to enable the nectarine to better serve mankind.

Anderson Combination Dipper, Perforator, Grader and Spreader

Send for new CATALOG of Packers' and Dryers' Machinery.

REVISED JUNE 6 1893 OCT 1 1895 SEPT 6 1898

The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1916 CATALOG.

It illustrates and describes the entire Anderson-Barrgrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

Ventura Walnut Tree Records Valuable.

Individual records on 45 budded walnut trees determined the ones from which buds were taken to topwork 250 acres planted later.

[Written for Pacific Rural Press.]

When Robert Oxnard and his associated wanted to develop their Tapo ranch at Santa Susanna, they decided to grow fruits and nuts distinctively Californian, to avoid any future competition with the rest of U. S. They first chose walnuts; but did not know what variety would be best. They planted a block of 45 Placencia Perfections in nearly a square, in 1907. They kept yearly records of the yield of each tree as given below, and made valuable use of those records later.

They then searched the State for a better variety and chose the Mayette. They planted 250 acres mostly of these, interset with apricots. The first walnuts were set 40 and 50 feet apart—the later, large planting 60 feet.

Two years after planting the Mayettes, they decided that the 4

Average of entire block (42 trees) 23.887

to 6 weeks delayed spring growth of that variety which is an asset in colder sections, was a loss at Santa Susanna, where Mr. Oxnard says the temperature is 5 to 6 degrees warmer than at Santa Paula where is located the largest lemon orchard in the world.

Buds from Best Producers.—The 250 acres of Mayettes were budded or grafted over to Placencia Perfection, using buds from the best producing trees of the original 45.

Difference Due to Individuality.—It will be noted that tree 19 was a consistently increasing heavy producer after records commenced at 5 years old. Variations in yield from an average of 61.75 pounds down to 2 pounds per season per tree are not due to disease, insects, or noticeable difference in soil, according to Mr. Oxnard. All have been treated alike. They had been grown without water; though water has now been developed for 1500 acres of the ranch.

The highest producers stand in a diagonal strip through the square.

The land is a light loam on top, getting somewhat heavier down to 30 or 40 feet deep. As it consists of soil washed down from the hills, and has a gentle slope, only careful soil auger experiments might show some difference in soil to partly account for difference in bearing of the trees. Most of the difference is credited, however, to the individuality of the trees; and it indicates that many walnut orchards even of budded varieties, contain trees which do not pay rent on the ground they occupy. Mr. Oxnard, however, will watch future records of the poorer original trees to see if they catch up in their mature years, with the yields of the better ones.

Orchardists who depend on the average or total production of their trees will be interested to note that the average per tree for the entire block for four years was 23.887 pounds. It would have been 61.75 pounds if all trees were like No. 19.

DECLINE STATE CITRUS DISTRIBUTION.

[By G. Harold Powell.]

The California Fruit Growers' Exchange, at a regular meeting of its board of directors on June 21, 1916, (all of its seventeen members being present), unanimously resolved not to become an adherent of the proposed State Bureau of Distribution as outlined by the committee appointed at the San Bernardino convention. This conclusion was reached after a re-investigation extending over several months, of the present distribution of the citrus fruit crop in all markets of the country. There has been no time when the California citrus fruit crop as a whole has been as well and as equably distributed to all markets of the United States and Canada as at the present time; and great progress is being continually made in strengthening the distributing system.

The Exchange is a voluntary association of citrus fruit growers organized without capital and operated at actual cost themselves for their benefit. The doors of the Exchange are open to any grower who is not now a member. Those growers who are not now having their products distributed to the best advantage may do so by joining the Exchange. They may thereby have their products sold through their own organization at the lowest cost of marketing any California fruit product. They may have the benefits of the national advertising of Exchange fruit; and of the large purchasing power of the Fruit Growers' Supply Company. They may participate in the other advantages which the Exchange gives the producer and which no other shipper is in a position to offer.

The marketing system of the California Fruit Growers' Exchange has been developed step by step through twenty years of constant study and evolution. The daily information secured by the Exchange regarding the supply of fruit in California, the consuming power of the different mar-

kets, the weather conditions, the supplies of competitive fruits, such as cantaloupes, strawberries, and peaches, gives its 8000 members the most complete daily market news service that has been developed for any American crop. At least 66 per cent of the industry is included in the Exchange membership, the organization having recently made the

largest gain in its history in the percentage of the crop handled.

Miss Lillian Clark of the College of Agriculture has started a "Mother-Daughter" club in Glenn county.

Imperial Valley honey beats last year in quantity and quality, being estimated at 100 pounds per colony for the 15,000 or 18,000 colonies in the valley.

"KNOW YOUR SOIL" The Standard Soil Tester

Will
Make You
Money

It is not a complicated or technical instrument that can only be understood by chemists or students, but designed to permit any one to test the fertility of soils in a simple, inexpensive manner and to eliminate expensive analysis.

The Fallacy of Paraffine base: Eastern oil manufacturers have long extolled the superior virtues of paraffine-base motor oils. But Pacific Coast motorists have proved that Zerolene, made from selected California crude, asphalt-base, gave best results. Their experience is now supported by the testimony of international experts. Lieut. Bryan stated before the Am. Soc. of Naval Engineers: "Oils made from the asphalt-base crudes have shown themselves better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils." Zerolene received highest competitive awards, San Francisco and San Diego Expositions. Dealers everywhere and at service stations and agencies of the Standard Oil Company.

ZEROLENE
the Standard Oil for Motor Cars

"THE PERFECTION"

-Prune Dipper and Grader

This is an automatic machine; no guess work about it; gives three grades, three trays up at once; dipping fluid is heated by a large oil-burner and a super-heater, to supply hot water to the tank when needed. The prunes pass through every inch of 65 gallons of hot water, therefore no sediment. Fuel expense from 6c to 7c per ton; labor cut 50 per cent; no installing expense; most efficient and economical machine on the market.

WHO ATE THE PRUNES?

To the Editor: We note the statement in June 24 issue of Pacific Rural Press that our figures on the marked decrease in the consumption of California prunes had been clearly controverted. We stand by our guns. Mr. Richmond has not met the issue squarely. He compares the consumption of prunes for a period ending 1905 with that of the consumption of prunes for 1915. Our original statement was that the domestic consumption for the 5 years ending 1902 was very much greater than that of the domestic consumption for the 5 years ending 1914. Mr. Richmond uses the packers' figures for production and we use those supplied by the State Statistician. The packers' figures run a little larger than the State figures and may be more accurate; but of that we are not yet convinced, but even using the packers' production figures for the same periods, Mr. Richmond will arrive at substantially the same results that we arrive at, as we both depend on the same export figures, those of the United States. We believe that Mr. Richmond's figures were put forth, not with the idea of showing up any alleged inaccuracy of ours, but more for the purpose of bulling the market, as it is well-known that he has large interests in the producing end of the game; and consequently desires to see as good prices of prunes as are possible. With the production of prunes in a general way practically stationary since 1899 and with exports very largely increased since that date, it is plain that there must have been a falling off in the domestic consumption. We are willing to admit that during the last three or four years the domestic consumption may not have decreased any and that during the last two years it has probably increased a little.

Growers' Information Bureau.
G. E. Merrill.

[The Information Bureau figures were taken correctly from the State statistician's report. As indicated, the domestic consumption for the first five years in which both production and exports are given (1898-1902 inclusive) was approximately 115,000,000 pounds of prunes. In the last five-year figures available, the domestic consumption was approximately 45,000,000 pounds. Mr. Richmond's corresponding figure was for the one year 1915, for which the conditions were abnormal and the consumption incomplete.]

MORE RATS!

To the Editor: I am pretty sure that there are ten times more rats than human beings in any city, town, village or farm in the United States. We have poisoned hundreds of them at a very little expense for strychnine and sugar. We at first took advantage of their fondness for "hen fruit"; but they got the "back to the land" idea and began to overrun the country around here this spring, taking little chicks by hundreds (some of our neighbors lost 90 per cent of their chicks), and we would find 4 or 5 lying dead with a small hole under the wing in our own brooder yards. As eggs are too high-priced, we tried Rat Corn, Rough on rats, Rat virus. They were too wary to

touch these. We therefore cut up some bread into pieces 1 1/4 inches square, soaked them in milk, put a little powdered strychnine on each piece, rubbed it in to prevent its floating off the bread when we poured a sirup, made from Golden C sugar, over each piece to disguise the bitter taste of the strychnine, and we had the satisfaction of knowing that there is an inexpensive bait that rats will take in preference to all others. The siruped bread was placed on the same piece of board on which were the other poisons that they refused to touch, yet they took all the bread for 12 or 14 nights, and some of them were so fond of it that they lingered a little too long and died before they could get back to their runs.

But unless there is concerted action all over the State, it is only a question of time when it will all have to be done over again.

San Jose. S. & B. G. Haigh.

LATE-PLOWED COVER CROP.

To the Editor: We note that you advise no cover crop for dry-farmed trees in regions of scant winter rains. A neighbor here sowed 60 acres to rye and allowed filaree and bur clover to grow on 80 acres, all of which made fair growth considering that winter is the dormant season. But to get a little more growth, he allowed it to stand two weeks after it should have been plowed. Result, cussing by the plowman, no moisture, and a poor, scrubby growth of trees. Trees plowed when the land was prime (same age and same soil) have made better growth with no cover crop. I. L. Sweet. Arbuckle.

Could The Engine Pull This Load Over Rough Roads?

Certainly not—only the steel rails keep the gigantic locomotive from miring down of its own weight.

The same applies to tractors—the Bullock Creeping Grip travels on steel rails, lays its own track as it goes. No lost energy—no wasted fuel—every ounce of power exerted at the drawbar in pull.

BULLOCK
CREEPING-GRIP
Tractor

No miring—no slipping wheels—no soil too wet or loose—no road too rough for the Bullock. The year 'round tractor—works when others can't.

Best for plowing and harrowing—can't pack the soil—will plow that "soft field." Unequaled for road work—furnishes stationary power without blocking. Very easy to operate; the most economical to buy, results considered. Our 12-20 Creeping Grip is the ideal tractor for the orchardist, built low and narrow and turns in its own length, —patterned exactly after our larger and higher priced machines.

Write for particulars and free "Creeping Grip" Book.

GRINDING ALFALFA MEAL FOR HOGS.

To the Editor: I find cured alfalfa hay for hogs very wasteful. Please give data on use of alfalfa meal; its advantages or disadvantages, method of preparing for grinding, cost of a small mill, and power to run it.—A. M. MacK, San Jacinto.

[L. H. Twede of Willows was feeding alfalfa meal to his hogs when we visited him a year ago. He writes June 20, 1916:

"Referring to your query, feeding alfalfa meal to hogs, will say that I am still feeding alfalfa meal except when I have green feed. During winter when there isn't any green feed, I mix the alfalfa meal as follows: one-fourth Croley's Pig meal, one-fourth middlings, and one-half alfalfa meal. For pigs 4 to 7 months old I mix three parts alfalfa meal and one part fine ground barley. Brood sows, half alfalfa meal and half fine ground barley. The class of swine we feed it to is pure-bred Berkshire hogs. We have now about 400 head."

Pigs eat all of the meal, but waste part of the hay. Its economy depends on whether cost of grinding and sacking and storage is less than cost of the wasted hay. We believe it is, in most cases. It is useless to bale hay for grinding; unless it must be hauled or shipped far enough to overbalance cost of baling by lessened cost of hauling. Have the hay dry for grinding.

One of several Smalley special alfalfa cutters is built for $\frac{1}{2}$ inch lengths with capacity of $\frac{3}{4}$ to $1\frac{1}{4}$ tons per hour, according to condition of hay, but with greatly increased capacity where adjusted for longer than $\frac{1}{2}$ inch cut. It requires a 15

h.p. gasoline engine, weighs 1900 pounds, and is listed at \$480. They also have a screen attachment to put onto their silage cutters when finely chopped alfalfa is desired. This is much cheaper. This recutting attachment on the Junior mill makes 500 to 800 pounds of meal per hour with a 5 to 8 h.p. gas engine.]

STEAM PRUNE DIPPER.

[Written for Pacific Rural Press.]

A steam boiler furnishes heat and power for the prune dip and grader on the ranch of Visalia Fruit and Land Co., who have 240 acres of prunes, and 80 of peaches. While their outfit might be more economically fixed up, the steam boiler idea seems a good one. A steam engine runs the continuous dipper and the shaker. It keeps a man tolerably busy dumping fruit into the machine. Ranch Supt. F. A. Hogan says that one man put 1600 boxes through in half a day a few years ago. Steam direct from boiler to dipping tank keeps the water uniformly hot.

The water is changed every day; or twice a day if too dirty. A small shovelful of 76 per cent Wyandotte caustic soda is thrown into the boiling water after every 100 boxes have run through.

Two cold water shower jets play on the prunes as they come out of the hot water, to wash off the soda and to stop the cooking quickly.

The dried prunes are never put into bins after heating up in the morning sun. They are stacked in the morning while still cool, and put into the bins. Thus "they come out of the bins bright and lifelike instead of brown and dead."

AIR COMPRESSOR IRRIGATION PUMP.

Air compressor irrigation pumps have low efficiency, but are highly desirable under certain conditions. The Tapo ranch at Santa Susanna, Ventura county, is developing 300 inches by means of air from one electrically driven Kimball compressor pump. A group of 9 or 10 wells is located in each of two ravines on the hillsides above the orchard land. On the ridge between them is the compressor which forces air through simple pipes deep into each well. This raises the water from 18 or 20 wells by using only one pumping plant. Thence it gravitates to the fields and orchards of which 1500 acres are to be irrigated.

Artesian water is secured here at 200 or 300 feet, according to Robert Oxnard, and they flow slightly when not being pumped. Wells have been put down and good water supply secured at the lower edge of the ranch, but these are only for demonstration and emergency.

The American Beet Sugar Co. at Oxnard raises 20,000,000 gallons of water per day on their factory site, by means of similar air pumps.

W. S. Rosecrans of Gardena, Los Angeles county, also has an air compressor pump, run by a 35 h.p. motor, but not used much on account of its low efficiency. Other wells with centrifugal pumps supply most of his irrigation. Where there is much sand in the water, Mr. Rosecrans believes the air pump would be best on account of wear on valves of other types.

OVER 5,000 IN
SUCCESSFUL OPERATION

Built to Permanently Solve Your Pumping Problems

With the introduction of Layne & Bowler Pumps, which were perfected after years of experimenting and the expenditure of over \$150,000, the exasperating pump troubles of the past disappeared. It became possible to produce a large stream of water from a small diameter well, to place the pump bowls at a sufficient depth to insure a constant supply of water, and the shafting and bearings being fully protected from sand and water, breakage and wear are effectually guarded against. These pumps, without question, represent the acme of inventive genius.

Write at once for our beautiful new catalog No. 25. It describes and illustrates over 20 different types of Layne & Bowler Pumps, including many new ones.

ALUMINUM PISTONS.

To the Editor: What do you know about leak proof cylinder rings made of aluminum?—E. A., Potter Valley.

[All inquiry fails to reveal anything of the nature except aluminum pistons for automobiles and aeroplanes. Several authorities suggest that as aluminum does not spring, it would not do for piston rings; and aluminum cylinder lining might do, but would probably crystallize.]

POWER NOTES.

Epsom salts are recommended for headlight dimmers. Dissolve a handful in a cup of water and apply to inside of glass. The result is said to be a beautiful frosting for several months.

Auto trucks by the dozens have been shipped to Imperial county to haul cantaloupes. This saves the former four-horse or mule teams from breathing the hot dust.

A national tractor demonstration circuit is reported as being operated by a committee of the national tractor and thresher manufacturers' ass'n in the central states beginning Jul. 17 in Texas and ending Sept. 8 in Wisconsin.

A straw spreader for the combined harvester gets best fertilizing advantage from the straw, with least trouble in plowing. It may be fastened onto the harvester, or geared onto a pair of rear wagon wheels, and hooked behind the machine but under a short conveyor.

That a series of deep wells along the Kaweah and St. Johns rivers, for irrigating 15,000 acres in the Lindsay-Strathmore district, would seriously impair the irrigation value of the rivers, was alleged in court proceedings to prevent the well driving.

Tulare county supervisors prohibited the use of grousers on tractors using county roads; but a protest set forth that outside tractors needed during harvest were thus kept out of the county.

A five-ton truck hauled 125 tons of cherries this season from Biceglia Bros.' orchards near San Felipe to Gilroy for shipment.

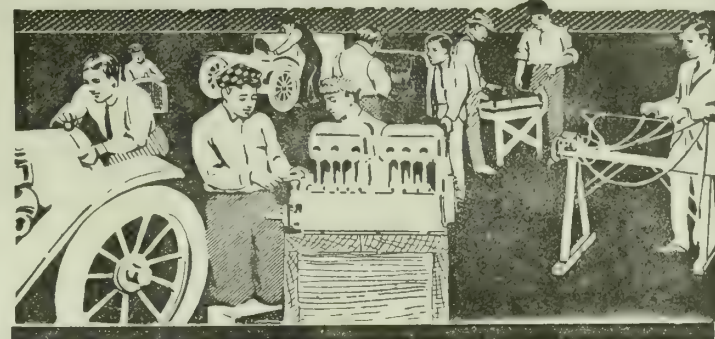

A bean thresher 30 feet long, 12 feet high, containing three cylinders 44x60 inches, was built last season by the Ventura Implement Co. for the Irvine ranch in Orange county. It cost about \$8,500.

A tractor-hauled combined harvester for lima beans was tried out last season in Ventura county.

The basis of most of the best anti-friction metals in use as Babbitt metal, is lead. Fast running journals are babbitted with a mixture of lead and antimony. Where boxings are subjected to heavy weight and wear, tin 89.3 per cent, copper 3.6 per cent, and antimony 7.1 per cent are preferred.

A big tractor demonstration will be held at the State Fair, Sacramento, beginning Sept. 4. Rules will be printed in these columns next week. It will begin with a parade of all tractors at 9:30 a. m. followed by three hours of public plowing and daily afternoon private demonstrations.

A Statewide movement to eradicate rabbits and ground squirrels through the Farm Bureaus was recently started in Kern county.

General Agricultural Review.

GRAINS AND FIELD CROPS.

A Davis barley grower reports 600 sacks from 15 acres.

Butte county rice crop is reported in the best condition ever.

A Lake county farmer has made over a swamp into a valuable bean field.

Bean growers in Monterey county are contracting their bean crops at \$5 per cental.

Recent rains in Butte county are reported to have damaged grain and hay very little.

A cantaloupe 30x33 inches in circumference and weighing 17 pounds was recently brought to Brawley.

Turlock cantaloupes have been moving East this week through the Turlock Merchants' and Growers' Ass'n.

The long dry spell is responsible for irrigation in the San Leandro district, said to be the first time in 30 years.

An Anaheim Lima grower recently sold 610 sacks at \$6.35 per cental. They were raised between orange trees.

Delta onions have been moving to Chicago at \$1.80 to \$1.90 f. o. b. landing. Upland onions are practically all marketed.

Rice irrigation at Madison is held responsible for hay crop failures around Davis due to inability to get water at the right time.

Cottonseed in the old cotton States sold at \$30 to \$40 per ton last fall, but farmers who had to replant this spring paid up to \$100 for seed.

About ¾ of Livermore Valley hay was reported last Saturday, sold at \$13 to \$15 for wheat hay and \$11 to \$12 for barley and volunteer.

F. A. Shipley of Santa Paula is the manager of the new Cal. Lima Bean Growers' Ass'n. He draws \$8,000 per year. Good management is necessary.

The Jacks Estate is selling alfalfa land to dairymen in Monterey county, in lots of 100 acres at about \$230 per acre, plus the cost of installing the irrigation outfits.

Oxnard sugar beet harvest is to begin July 17. San Fernando valley beets are a little later. 1800 tons per day will be handled at the start, and 900 tons more daily, later.

Of the 4057 carloads of cantaloupes shipped from Imperial Valley before June 30, 5100 crates were condemned by the inspectors-at-large besides what were condemned at the shipping sheds.

The American Beet Sugar Co. will pay its bonus of 50 cents a ton over the \$4.50 contract price for beets yielding 15 per cent sugar, with the regular payments instead of waiting 10 to 12 months as their contract allows.

The grain and hay crop in Tulumne county was very spotted. Where the ground was summer fallowed and a good seed bed obtained, the barley, oats, and wheat matured a good crop. 50 per cent would be conservative for the whole county.

A four-months beet sugar run to put out 100,000 bags, was commenced early in July by the Visalia factory of the San Joaquin Valley Sugar Co. Beets for this factory have been planted in Kings, Tulare, and Kern counties.

The July 1 Government crop reports and forecasts for Cal. this year, and final estimates for last year respectively are: corn 2,280,000 bushels and 2,624,000 bushels; wheat 4,700,000 and 7,040,000; oats 6,080,000 and 6,963,000; barley 32,300,000 and 39,440,000; rice 4,180,000 and 2,268,000; potatoes 8,790,000 and 10,140,000; sweet potatoes 931,000 and 810,000; hay condition 79 as compared with the 8 year average of 85; cotton 104,000 bales and 28,551 bales; sugar beets condition 90 as compared with 10-year average

of 93; beans condition 86, ten-year average 90.

DECIDUOUS FRUITS.

Many Gilroy prunes are dropping.

The Porterville cannery began operations on peaches this week.

Dried apricots are reported as of specially good quality around Los Gatos.

Several thousand nursery seedlings were raised by Placer county fruit growers last season, writes hor-

tical cultural commissioner C. K. Turner.

Stockton reported scarcity of peaches last week for the local trade.

Sam Samuelson has been appointed manufacturing manager for the Cal. Peach Growers.

Many Healdsburg prunes are developing spots similar to sunburn and are dropping prematurely.

Contra Costa prunes are badly cracked, though there has been no irrigation. Aphids have been rather bad.

Hunt Bros. cannery at Haywards began their summer's run of fruit

and vegetables last week with apricots.

The cannery at Watsonville expects to start July 17 to can four or five thousand chests of blackberries.

Nevada county fruit planting last season was far below that of the four previous seasons, according to horticultural commissioner D. F. Norton.

A large quantity of freestone peaches for canning have been purchased by C. F. C. A. around Hanford to fill the gaps between cling peach ripening.

DAIRYMEN !!

MAKE RESERVATIONS NOW

For This Season's
Supply of

DRIED BEET PULP

The beet sugar factories will soon begin the slicing of this season's beet crop—and that means a new supply of Larrowe's Dried Beet Pulp. While we will have a somewhat larger supply than last year, yet the demand is also larger—in fact, has increased enormously.

Foresighted dealers in nearly every district have already placed orders for shipment—but if you wish to make sure of getting what *you* require it will be well to see your dealer at once and give him an order for early delivery or state the amount you think you will need during the next few months.

Everything seems to favor the man who is prepared, so we say—"see your dealer *now*."

—is a succulent, milk-producing, vegetable feed that gives certain and profitable results. Combine it with alfalfa and it makes a wonder ration. It increases the milk flow from 1 to 5 lbs. per day from each cow, and in addition keeps your cattle healthy, sleek-coated and bright-eyed.

Larrowe's Dried Beet Pulp is light, bulky, succulent and easily digested; absorbs water very quickly and swells to about six times its original bulk; is cheaper than bran and other mill feeds, yet produces better results. It is put up in convenient 100-lb. sacks, and may be had either plain or with molasses. Ask for "Larrowe's."

Feeding Booklet Free—Write for it!
"Profitable Feeding" contains valuable information that should be in the hands of every feeder. Sent free on request.

THE LARROWE MILLING CO.

934 Central Building

LOS ANGELES, CALIFORNIA

An enthusiastic crowd of prune growers overflowed the courtroom at Napa July 8 to hear Col. Weinstock, Jas. Madison, and G. E. Merrill talk about organization.

Two new fruit sheds have been built this season on the Oakland, Antioch & Eastern Ry in Contra Costa county to pack fruit for shipment to the East.

E. B. Anderson's Bartlett pear trees in Contra Costa county have had to be propped to hold the best crop in years. Picking for eastern shipment commenced this week.

Last year was an apple-worm year, and last winter was not so fatal as usual to the overwintering worms, so special vigilance is required this year according to Washington Expt. Sta.

We have recently received a copy of the report of the Fruit Growers' Convention at Visalia, full of fruit and nut facts by authorities of experience in California. Published by the State Commissioner of Horticulture.

M. D. Kennison of Napa not long ago received returns on fancy cherries sold late in June on the New York auction: 10 boxes 9-row Bings @ \$4.25; 2 boxes 8-row Lamberts @ \$6.37½; 20 boxes 9-row Bings @ \$4.50. Such prices are very rare so late in the cherry season.

GRAPES AND SMALL FRUITS.

Recent weather has favored mildew in Fresno county.

There seems to be a legal flaw in the Associated Raisin Co. contracts with growers.

Sultana grapes were sold on the Riverside public market July 6. They were a bit sour.

Twenty-nine cars of grapes had been shipped East from Imperial county before July 1. Fifty sugar tests had been made.

Four thousand tons is a full berry crop for Sebastopol according to Mgr. I. N. Cable of the Berry Growers, but frost got about 25 per cent of it.

As soon as Thompson raisin prices were announced by the Associated Raisin Co. the orders previously taken were confirmed, and very shortly practically the whole crop was sold. Seeded raisin prices will be announced in a few weeks.

Arakelian Bros. seem to have thought themselves immune from the Standardization law in regard to grapes. When it was enforced on them by holding up a carload, they are said to have attempted the removal of the horticultural commissioner through both the State horticultural commission and the county supervisors.

CITRUS, OLIVES, NUTS.

The Arbuckle Almond Festival will come Oct. 6 and 7.

The California Almond Growers' Exchange recently secured a permit to build an \$8,300 addition to its Sacramento shelling plant.

One of the pioneer walnut and almond planters of Contra Costa county is allowing many of his almond trees to be defoliated already by the red spider.

The U. S. Dept. Agr. estimates the condition of Cal. oranges July 1 at 5 per cent better than the past 10-year average, and lemons 3 per cent better. For the U. S., oranges 1 per cent better than a 10-year average.

One corporation brought 242,700 nursery seedlings into Yuba county last season. These were mostly olive and orange with some deciduous and some shade trees, writes horticultural commissioner G. W. Harney.

MISCELLANEOUS.

Stanislaus county has appropriated \$300 per month for squirrel killing.

Over 10,000 ornamental and shade trees and plants and 400 palms were planted in Yuba county last season, writes horticultural commissioner G. W. Harney.

Some 50,000 eucalyptus seedlings and 20,000 cypress were set in Monterey county for windbreaks last season according to horticultural commissioner J. B. Hickman. About 7500 ornamentals were also planted.

PERSIMMON STOCK.

To the Editor: I have a great many deciduous fruit trees and would like to know what I could graft persimmon into.—J. C. S.,

[Japanese and American persimmons are the only stocks we know on which persimmon may be grafted.]

Ira Vail Won \$2000

Against the World's Great Racing Cars with a

Hudson Super-Six

The Only Car That Kept Going

The Hudson Super-Six is not built for a speed car. And we don't build special racing cars.

Our speed tests are made to show the endurance of our patented Super-Six motor. And here is one test which did it.

Met \$10,000 Cars

The Metropolitan Race on the speedway in New York is the great racing event of the year. The world's best racing cars are entered. Their cost will average \$10,000 each.

Ira Vail, of Brooklyn, entered that race with a Hudson Super-Six, which had been run for months. And everybody laughed. The motor was our regular Super-Six. The car, being a used car, cost him \$1,300. For such a car to meet the world's finest racers seemed like David and Goliath.

It Never Stopped

The other cars ran faster, but they had to stop. The terrible speed called for repairs and adjustments. The Super-Six ran the 150 miles without a single stop. It was the only car that did that.

So the Super-Six defeated most of those racing cars. It won third place and \$2,000. It was only five minutes behind the first car. All because this engine excelled all others in reliability.

1,819 Miles in 24 Hours

Another Super-Six ran 1,819 miles in 24 hours. That is as far as from New York to Denver. And one man drove it all the way.

That was a stock chassis, exactly the same as in the cars we sell. The A. A. officials certified to that. No other stock car has ever run more than 1,200 miles in that time.

That was due to endurance. The Super-Six kept an average speed of 75.8 miles per hour, and kept it for 24 hours.

Like 10 Years' Use

That same Super-Six has been run at top speed for 3,800 miles. And not a part or bearing in the motor shows evidence

of wear. That means more strain than ten years' average use.

That is what we are proving—how the Super-Six will last.

This motor is a Hudson invention, controlled by Hudson patents.

By eliminating vibration—the cause of friction—the power is increased 80 per cent. So the Super-Six—a small, light Six—delivers 76 horsepower.

And that same utter smoothness gives this wondrous endurance.

Hudson Now Supreme

The Super-Six motor makes the Hudson car supreme. The man who owns one feels himself the master of the road. He meets no car so powerful, so speedy or so flexible. No stock car ever built has matched it in performance.

He meets no car more beautiful, more luxurious or impressive. He meets no car so durable. He goes anywhere and everywhere with a knowledge that none ride more safely or comfortably. And yet the owner of a Super-Six pays but a modest price.

Here is a car 80 per cent more efficient than Sixes used to be. When you buy a fine car you are bound to select it. So we want you to know the facts.

7-Passenger Phaeton, \$1,475 at Detroit

Hudson Motor Car Company

Detroit, Michigan

The new Four

Overland
TRADE MARK REG.

What 1000 Cars

These two latest Overland developments again emphasize the enormous economy of enormous production.

No one has ever before made 1000 a day of cars of this size and class—nor half that many.

1,000 cars a day enable us to use materials of a much higher quality and not only permit but actually enforce an accuracy of workmanship which smaller productions of cars in the same price range neither permit nor require.

1,000 cars a day make possible better, larger, much more comfortable cars than

have ever before been possible at anywhere near the price.

* * *

This newest Overland is the largest Four ever offered for so low a price.

In the first place, note the longer wheel base—112 inches.

The enbloc 35 horsepower motor which has made the Overland famous is continued.

True—it is perfected even more and now it is a fitting climax of the experience obtained from a quarter of a million of these Overland motors in daily use.

Shock absorbing cantilever type springs are a big improvement.

The gasoline tank placed in the rear is another improvement. The vacuum system insuring a steady even gasoline flow at all times is still another improvement.

The famous and complete Auto-Lite electric starting and lighting equipment is furnished.

All electric switches are on the steering column—right within reach.

The artistically designed streamlined body with one piece cowl makes this one of America's most attractive new cars.

The New Four

Model 85-4

35 horsepower en bloc motor
112 inch wheelbase
32 x 4 inch tires
Cantilever rear springs

Auto-Lite Starting and Lighting
Vacuum tank fuel feed
Gasoline tank in rear with gauge
Electric control switches on steering column

The Willys-Overland

Overland Announcement

The new Six

Day Make Possible

Get the price of this, our greatest four-cylinder value, is less than any car of its class ever sold for before.

* * *

No less a pace maker is the newest Overland Six.

Here is the Six of Sixes! A snappy four-passenger long-stroke 40-horse-power model—easy to handle, light, economical, mighty comfortable, having all the advantages of higher priced Sixes, yet it comes absolutely complete at a lower price than any other six of its size.

Its smart body design is long and low—having lines of artistic simplicity.

And the motor! This will warm the heart of every six cylinder enthusiast in the country.

You've heard all about fast get-aways—smoothness—crawling and climbing on high. This Six does all that and then some!

The wheel base is 116 inches. It has cantilever springs and even-flow vacuum system with the gas tank in rear,

The tires are four inch. It has the complete Auto-Lite electric starting and lighting equipment with all switches on the steering column.

* * *

Some Six! Yet the price is lower than any other Six of its size.

But go to the nearest Overland dealer and see these new models. Go over them—note all the very real and important improvements, and learn the prices.

The Overland dealer is ready to make demonstrations of both models now.

With the Livestock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

A Colma dairyman is charged with selling adulterated milk.

W. Kaiser recently shipped three cars of dairy stock from Hollister to his new alfalfa ranch near Oakdale.

Eleven cows in the Napa Cow Testing Ass'n produced over 40 pounds fat during the month ending June 15.

For 15 years Fresno has required all city milk to be from non-tubercular cows. Cream may be from tubercular cows if it is pasteurized.

F. M. Hollingshead of Wheatland has sold his 240 acre ranch to a Folsom dairyman who will stock it with purebreds. Sale price \$15,000.

Cow tester Bruno Kaehler began operations last week in the new Orland Cow Testing Ass'n. There are 58 dairymen with nearly 1000 cows in the Ass'n.

C. G. McFarland of Tulare has traded his ranch for an undeveloped place and is selling half his Jersey herd which includes many Register of Merit cows.

Modesto is to have a cheese factory in connection with the creamery, to begin operations by Aug. 15. The building will be 35x100 feet.

Of 750 Holsteins, recently admitted to advanced registry, more than half were with their first or second calves, but they all averaged 390.9 pounds milk containing 13.776 pounds fat, in 7 days.

GRADE COW RECORDS.

Following are records made by grade cows in June in the Gridley Cow Testing Assn.

Owner of Cow.	Breed	Pounds Milk	Percent Fat	Pounds Butterfat
C. Goetz, Tudor.	Shorthorn	1371	4.8	65.8
D. Beale, Gridley.	Holstein	1377	4.4	60.6
H. Berg, Marysville.	Holstein	1557	3.6	56.0
W. J. Condon, Chico.	Shorthorn	1185	4.7	55.7
J. H. Guilli, Chico.	Holstein	1554	3.5	54.4
J. H. Guilli, Chico.	Holstein	1620	3.3	53.5
S. A. Mealy, Gridley.	Holstein	1089	4.9	53.4
D. Beale, Gridley.	Holstein	1575	3.3	52.0
J. Fronchay, Tudor.	Shorthorn	1389	3.7	51.4
J. H. Guilli, Chico.	Holstein	1623	3.1	50.3

State Dairy Inspector C. A. Peairs recently rode two trips in one day with a Tulare county cream collector who started at 5:30 a. m. and finished the second trip at 1 p. m. Patrons on the second route were in-

Register of Merit records of the Jerseys belonging to C. G. McFarland of Tulare are given herewith: Meridale Melia Kissam, 658.5 lbs. butter, 7 yrs.; Philadelphia Glory Zella, 631 lbs., 11 yrs.; Philadelphia Glory Gertie, 592.3 lbs., 13 yrs.; Rieters Miss Gertrude, 584 lbs., 4 yrs.; Raleigh's Meridale Matte, 555 lbs., 6 yrs.; Irene Dew Drop, 530 lbs., 2 yrs.; Lulies Coomassie, 441 lbs., 5 yrs.; Smith's Katy, 440.9 lbs., 6 yrs.; Brown Irmalie, 440.9 lbs., 4 yrs.; Pearl of Willowwood, 378 lbs., 2 yrs.; Dot of Willowwood, 350.6 lbs., 2 yrs.; Bonnie of Willowwood, 350.5 lbs.; Emma of Belevue, 340 lbs.; Elodine B., 324.1 lbs.

SWINE BREEDERS AND STOCK.

H. E. Boudier of Napa recently sold a Duroc boar to Messrs. Chas. Schnepfe and Frank McCullough of Dunnigan.

T. B. Spalding of Turlock has imported two Poland China sows and a "magnificent" boar from Iowa. The boar is sired by Champion Big Ben and out of an A Wonder dam.

Haden Smith of Woodland has sold 1 boar and 1 gilt to Frank Gilloon of Shasta county and service boars to Miss Park of Santa Barbara and F. E. Harcourt, Delano. This makes 53 head sold in the six months ending Jul. 1.

A. B. Humphrey of Escalon has traded a Grand Leader 2nd sow pig to Frank Steel of Grant's Pass, Ore-

structed to wrap wet sacks around their cream cans. Those on the first did not. Of the 18 cans showing temperatures above 70 degrees when picked up, 12 were on the early morning route.

gon for a sow pig sired by Laurel Champion, said to be the sire of more first prize Berkshires than any boar in the Northwest.

SHEEP, HORSES, BEEF.

A carload of three-year steers were sold recently by Devaney & Hayes of Midway at \$90 each.

Thirty-eight mules were burned to death in a barn at Chowchilla July 6. No insurance.

Henry Wheatley of Napa has sold a registered Shire stallion and two mares to M. C. Allen of National City.

Alfalfa hay fed to steers by the Tenn. Expt. Sta. proved worth \$14.20 per ton besides the manure which contained most of the fertilizing value of the hay.

W. R. Madden of Suisun has contracted in Montana for several registered 7 months Hereford calves to be delivered in November. He could not buy 2-year-olds.

Mrs. F. A. Mecham of Petaluma writes that they are nearly sold out of Shropshires, having recently sold 100 purebreds to J. S. Garnet of Wil-lows. They still have plenty of Merinos.

J. W. Marshall and Wilbur Eibe of Dixon have rented the Muzzy ranch near Elmira consisting of 4600 acres grazing land. They bought the 2500 sheep on it, the deal involving \$25,000.

The Texas Boys' Baby Beef Club has over 1200 members. Last March 300 boy feeders of pigs and baby beeves gathered at Ft. Worth Nat'l Feeders' and Breeders' Show to ex-

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; if carried weekly for one year, 2 1/2c per word.

SWINE.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

FOR SALE—Big-type Poland Chinas from Iowa's best herds. Big Bone, A. Wonder, Jumbo Fashion, and Smoother Price breeding. Show stuff. Gilts bred and open. Boars ready for service of finest breeding, and a fine two year-old big-bone brood sow, No. 563426, with 8 pigs two weeks old. Five sows and 3 boars, all beauty. Sire, Black Wonder, No. 235117. Sow farrows not less than 8 pigs each little and raises them all. A certain 500 per cent on investment. Dr. T. B. Spalding, importer and breeder of Big Type Poland China Swine, Turlock, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. F. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

REGISTERED Duroc-Jerseys—All ages. We have produced hogs weighing 240 lbs. at 7 months, at a cost of 3-10 cents per pound, including pasture, grain and upkeep of sow. If you want some of the kind it pays to raise, we would suggest that you order immediately, as our spring stock is growing rapidly. Haden Smith, Woodland, Route No. 1, Box 84D.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sex. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

REGISTERED Duroc-Jersey—Weanlings, shoats gilts and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. **BELLA VISTA HERD**, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BARGAINS IN CHESTER WHITES—Few excellent bred gilts, \$30; sows, \$35. Service boars, \$20 and up. Weanlings, \$10. Best blood lines. Only good individuals shipped. Dallas Bache, Hollister, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

Duroc-Jerseys—Some great weanlings of both sexes by "RIVER BEND HIGH MODEL." Improve your herd by introducing this blood. **RIVER BEND FARM**, St. Helena, Cal.

FOR SALE—Fancy belted Hampshire hogs. Well belted young sows and boars registered. Prices reasonable. Ben F. Thorpe, Manager, Canfield Estate Ranches, Bonsall, California.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

DEL DAYO FARM—(Old Haggin Bottom Ranch)—Breeders of registered Berkshires. Both sexes for sale. Stephen S. Day, Box 1140, Sacramento.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Registered stock of all ages. Prices and description on application. R. J. Merrill & Son, Morgan Hill.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

LARGE TYPE POLAND-CHINAS—Now booking orders for Spring pigs from our Nebraska prize-winning sows. H. I. Marsh, Route A. 348, Modesto.

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Norato, Cal.

POLAND CHINAS—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

POLAND-CHINAS—250 lbs. in six months our aim. Imported sows. None better. Linn & Porter, Route A., Modesto, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

REGISTERED POLAND-CHINA SWINE—Prize-winners. Finest stock in the state. \$20 up. M. Bassett, Hanford.

pounds on hoof and dressed 60.8 per cent.

LIVESTOCK IN GENERAL.

The soldier boys on the State Fair grounds put in a complete sewer system in one day. This has been a crying need these many years.

A score of searchlights on top of the State Fair grandstands used to light the militia camp, may be left as a permanent feature.

Sonoma and Marin Agricultural District Fair at Santa Rosa Aug. 7 to 13 inclusive, instead of Aug. 7-12 as announced last week.

"The Stanislaus Livestock Show and Exposition" was tentatively dated for Sept. 16-19 at a meeting in Modesto June 28. Livestock exhibitors are assured of comfortable quarters for stock and suitable premiums.

Prices to producers of hogs, cattle, sheep, and chickens in U. S. increased two-tenths per cent from May 15 to June 15. On the latter date prices of these meat animals averaged about 16.7 per cent higher than a year before; 10.7 per cent higher than two years before and 19.2 per cent higher than the average of the past six years on June 15.

RIO VISTA TO HAVE COLT AND HORSE SHOW.

We are advised by E. W. Westgate, president of the Rio Vista Horse Show and Stock Association, that everything in connection with the second annual horse and colt show is in first-class shape. The supervisors of Solano county have donated \$500 for the show this year, and liberal premiums will result. Cattle, sheep, and hogs will be added attractions this year, but the colt and horse show will be featured. The California Stallion Registration Board has offered a prize of \$50 for the best stallion and three of his get which is expected to bring out a number of entries. Premium lists will be ready for distribution in a short time.

TO INAUGURATE MAIL BIDS AT AUCTION.

[Written for Pacific Rural Press.]

A distinctly novel feature of Carruthers Farms' Berkshire sale is brought out in the announcement of Mr. Carruthers that he has provided for mail bids by securing the co-operation of the following representatives of the swine industry: Prof. J. I. Thompson, Sect'y, California Swine Breeders' Ass'n; W. S. Guilford, Sect'y Western American Berkshire Breeders' Ass'n; and J. L. Thatcher, representative American Berkshire Congress.

In the Eastern auction sale, distant buyers are always afforded this convenience; but this is the first time prominent breeders have been secured for this service in a California swine sale; and as a result, many who live at too great a distance to attend personally, will doubtless pick their animals from the catalogs and depend upon the above well known Berkshire judges to do the buying.

That the sale will be different in quality of offering as well as in manner of handling is readily agreed upon by all who have seen the offering and their pedigrees.

Included in the lot are three young show herds consisting of three sows and a boar that have been purposely selected because of their outstanding individuality and breeding. These should be eagerly bid on for foundation purposes. Then there are two young sows, Mayfield Lady and Mayfield Lady 2nd which are considered by Prof. Thompson to be the best sows bred on Carruthers Farms.

Mr. Carruthers himself considers the young boar Ames Rival 119th the top boar of the offering; and without question he is one of the finest young prospects in the State. Another one which Mr. Carruthers ranks as among the best is the sow Rookwood Laurel 24th, a young sow that will weigh over 400 pounds by sale day.

The Light Running ACME FEED CUTTER and SILO FILLER Built in Seven Sizes

A Few of Its Special Features:

All Steel Frame	Triple Frame Construction	Low Feed Table	Positive Safety Device
Malleable Knife Head	Accurate Knife Adjustment	Automatic Feeding Device	
Center Hung Blower	Six Arm Blower Fan	Reversible Feed Rollers	
Independent Control of Blower and Cutter Head Spread			

THE ONLY MACHINE WITH THE ANGLE CIRCLE SHEARING CUT,

which produces the "better quality" fine, uniform ensilage the dairyman and stock raiser are looking for. Built on sound scientific principles, every one based on actual tests. Give it any ensilage cutting test you know of. It will make good under every conceivable condition of actual service. Go where you will. Investigate thoroughly. You'll find more real, downright quality, point for point, in the Acme than in any other.

The Acme Alfalfa Meal Attachment

can be fitted to all sizes of Acme Feed Cutters. This attachment will enable the making of an excellent grade of Alfalfa Meal from alfalfa hay at a cost not exceeding that for baling.

Successful Co-operative Creamery.

[Written for Pacific Rural Press.]

One of the most successful co-operative marketing undertakings established during the past couple of years is the Petaluma Co-operative Creamery located in Petaluma and managed by W. B. Hopkins.

This concern was organized by the dairymen of that vicinity about two and a half years ago with a capital stock of \$25,000, of which \$22,500 has now been paid in on 4500 cows.

Altogether there are 5,000 shares in the corporation. At the present time there are 91 stockholders, each of whom is a dairyman and each stockholder holding one \$5 share of stock for each cow milked.

No one but a dairyman has ever been allowed to become a shareholder; and when one of these goes out of business the company buys back the stock at its par value, thus insuring the concern against possible speculators with outside interests.

Each member is paid for his cream on a butterfat basis, receiving a higher premium over the San Francisco quotation than competitors will pay, all cream being delivered by the dairymen themselves. Those who deliver three times a week are paid a little more than those delivering but twice a week.

Each member is provided with a cream cooler; and by frequent visits from the manager, the cream arrives in unusually good condition. The present system of grading is not, however, entirely fair, as it sometimes happens that a dairyman who takes particularly good care of his cream is not so situated that his cream can be delivered three times a week, while one who is less particular, but closer to the creamery, secures the top price because he makes more frequent deliveries.

Besides the additional premium over the San Francisco butter quotation, stockholders receive a bonus of all moneys over and above interest on investment, depreciation, etc. For the first six months of the present year this bonus has amounted to three-quarters cent a pound for all fat delivered. An annual dividend of six per cent on all the stock has always been paid, thus making a good return possible on the original investment.

Mr. Hopkins states that during the present year, they will turn out approximately 750,000 pounds of butter, which amount would have been larger except for unfavorable feed conditions. The larger portion of this butter is sold through a San Francisco commission house which has contracted all the output except that sold locally. Only pasteurized cream is used; and with the quality of cream received, it is possible to turn out a high grade of butter at all times.

PROSPECTS FOR 1916 STATE FAIR.

[Written for Pacific Rural Press.]

With \$5,000 additional premium money and a breeding fraternity that has been greatly enlarged since the 1914 State Fair, it seems certain that the coming State Fair at Sacramento, September 2 to 9, inclusive, will outshine all other livestock exhibitions staged in the State in the

Reports from all parts of the West tell of breeders who will make their initial showing at Sacramento this year. Present prospects are that the swine show will draw more new breeders than any other division, because of the enormous number of new exhibitors, together with the auction sale and futurity contests that will be held during fair week.

Dairy cattle will again take the lead in the cattle divisions, all of the prominent breeders having signified their intention to come out with strong herd shows. That the show will draw breeders from the Northwest is also certain, the impression gained by northern breeders at the P. P. I. E. last year evidently having been good.

The renewed interest in beef breeding is evidenced by the announcement of several new breeders that they will be out with show herds imported from the East since the 1914 State Fair was held.

Horses and sheep promise to be equally as good a show as anything staged in recent years, and better in some classes.

As entries for all classes of livestock close August 2, those expecting to exhibit should write for premium list and application blanks at once, addressing their letters to Chas. W. Paine, State Fair Grounds, Sacramento.

FALL COLT SHOW.

[Written for Pacific Rural Press.]

The movement through the country today is not for more horses, but for better ones; and whatever the future demand may be, the man raising the better class of horse will receive the better price.

Such is the logic of those most interested in the business of horse-breeding; and it is to encourage this belief that the colt show has come into prominence through the Middle West, in recent years.

Last year two of these shows were held in California, one at Rio Vista and one at Livermore. Both were considered highly beneficial in their respective districts. Both will be held again this fall, according to advices just received.

These shows are usually held entirely separate from county fairs, but could be profitably incorporated with such events. There are various ways of securing the necessary funds. At both Rio Vista and Livermore the merchants contribute to the prize fund.

In Minnesota one show is financed by the stallion owners, each giving \$25 in cash prizes, to be divided among the colts sired by his stallion. Another plan is to have the county horse breeders' association or the various farmers' clubs contribute sufficient money to finance the show; still another scheme is for the local bank or banks to furnish the money for premiums and other expenses.

Competent judges can probably best be obtained by taking up the matter with the animal husbandry division of the State agricultural college or with the stallion registration board. Either of these bodies probably will be willing to co-operate with the local committee and furnish efficient judges for the show.

One of these shows could be profit-

Hot Weather

the season a

DE LAVAL SEPARATOR

saves most over
any other separator
or skimming system

IT'S A GREAT MISTAKE FOR any dairy farmer without a separator or using an inferior machine to put off the purchase of a De Laval Cream Separator in the summer months.

GREAT AS ARE THE ADVANTAGES of the De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

THIS IS BECAUSE HOT WEATHER conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

THEN THERE IS THE GREAT saving in time and labor with the simple, easy running, easily

cleaned, large capacity De Laval machines over all other methods or separators, which naturally counts for most at this time of the year.

HENCE THE GREAT MISTAKE of putting off the purchase of a De Laval Cream Separator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself by next spring but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

EVERY CLAIM THUS MADE IS subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

IF YOU DON'T KNOW THE nearest De Laval agent, please simply write the nearest main office as below.

CALIFORNIA POLLED ANGUS CATTLE.

To the Editor: I should like to know all about the Polled Angus breed of cattle, their size in comparison with other breeds, their maturing qualities, and adaptability to foothill conditions.—Subscriber, Sonora.

[Answered by Prof. Gordon F. True, University Farm, Davis.]

[The polled Aberdeen Angus breed are black, hornless cattle originating in Scotland. While in appearance they seem smaller than Shorthorns and Herefords, they attain practically the same weights. The breed is characterized by early maturity, high dressing percentage and such a distribution of fat and lean meat in the carcass as to make a high-class butcher's beast. In thirteen out of fourteen times, Aberdeen Angus carcasses have won first place at the International Live Stock Show at Chicago, while ten out of fourteen championships for best steer in the show have gone to this breed.]

There are two herds of this breed in the foothill regions of California. One of these herds, kept in fenced pastures, I have seen; and they looked as well as animals of any breed. Some of the older stockmen of the State credit the Angus with getting wilder on the range than Herefords or Shorthorns. They have been credited with being shy breeders, but when fenced away from horned cattle they are as prolific as any and no harder to handle. They are probably less profitable under conditions of extreme hardship on the range than Herefords or their close relations, the Galloways.]

WHEN TO FEED PIGS.

To the Editor: I have a sow which killed her last litter of pigs by lying on them. I want to take the little pigs away this time, and keep them in a box near her pen, only allowing them to be with her at feeding time. How often should they be fed?—L. C. L., Brawley.

[Feed every three hours for the first two or three days, or longer if the pigs do not seem able to take care of themselves. If you will cut off the pigs' teeth with a small pair of nippers as soon as born, and provide a guard rail in the farrowing house or pen, there will be less likelihood of the sow lying on them. Most sows do not roll around badly unless irritated. Oftentimes the little fellows bite her teats so hard she cannot stand it. The guard rail also protects them; as it leaves a space around the edge of the building large enough for them to crawl into.—Editors.]

DAIRY COW COMPETITION.

The University of Cal. Circular announcing the Dairy Cow Competition goes to press this week, but will not be ready for distribution until August 1.

The offspring of pampered, overfed, under-exercised mares are most likely to succumb to navel and joint disease, leaking navel, or digestive disturbances, such as have caused great mortality of foals in Wisconsin this spring, according to Wis. Col. Agr.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. **PRINCE GELSCHER WALKER**, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by **KINTYRE LAIRD**, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality the herd is unexcelled in the West. At the head of the herd is **BANKER'S BOY**, junior champion and reserve grand champion at P. P. I. E.

WOODLAND, CAL.

DEVELOPING LAND AND DUROCS.

[Written for Pacific Rural Press.]

Developing red hogs and land is one of the striking things, agriculturally speaking, in Napa county at this time, it having been told the writer on a recent trip there that no less than 20 herds of purebred Duroc hogs have been founded during the past two years in the county.

Among the leaders of this red hog business is W. W. Everett, owner and manager of the River Bend Farm, comprising 240 acres a few miles from St. Helena.

A hundred acres of the land in this ranch is rich river bottom, the balance being hill land sparsely covered with timber. The latter furnishes a good deal of pasture in the spring months and part of it has been cleared and will hereafter be planted to vetch and oats, to increase the yield of spring feed.

The lower land is to be used mostly for hog feed raising; although a small acreage has been planted to vineyard, and a small orchard will be planted later.

Alfalfa and corn will be the chief crops grown, experience showing that corn will yield an average of two tons to the acre. So far only five acres have been planted to alfalfa; but during the spring months, a well was dug that has developed a 750-gallon per minute flow, and by carefully conserving this by the use of a six-inch galvanized iron pipe distributing system, 40 acres will eventually be planted to alfalfa.

Fifteen acres of this will be fenced off into three lots for pasture, 6x8

foot individual houses being used for sleeping quarters and built on runners so that they may be moved.

A lane has been built in front of these lots which extends through an adjacent field where the central farrowing house and dairy barn are to be located. This central house is to be built along the most modern lines, with creosoted blocks for the floor of the sleeping quarters. The chief reason for erecting this building is to reduce mortality in the pigs; for while the average sized litter raised this year was a trifle better than nine, the severe winter storms caused some losses and delayed proper growth.

The site selected for the runways is a gravelly, one might almost say rocky knoll, with a pronounced slope to the small creek which runs through the property, thus insuring well-drained lots in winter. This creek is another natural asset, as it supplies unlimited quantities of gravel for the concrete work which will be extensively used.

Selection is Mr. Everett's hobby in the hog lots. At the beginning he purchased females from older breeders in the State; and from these has gradually selected those nearest in type and color to his idea. While he now has 20 sows, a large percentage of these will go into the butcher pens the coming summer.

With pigs he has set the same rigid ruling; all pigs for any reason inferior, being put into the fattening pens where he believes they belong, rather than at the head of some farmer's grade herd.

Mr. Everett expects to show at the State Fair this year, and is one of the leaders of the Duroc movement in Napa county.

Veterinary Queries.

COW DOES NOT BREED.

To the Editor: A good milking cow had a calf, but I have taken her to the bull six times; and each time, a day later, she passes bloody stuff. Have washed her out twice with baking soda.—A. G., Healdsburg.

[Have your veterinarian examine this cow and prescribe a treatment.]

HORSE VOMITS AND RETCHES.

To the Editor: My horse vomits and retches after eating or drinking. Gets better for a few days, then worse. Been so for two months. Getting thin and weak but coat looks good. Feed green alfalfa exclusively. Excreta dry and hard, urine excessive. Restless, no nasal discharge, breath not offensive.—J. C. F., Alpaugh.

[This is chronic choke. Feed slops for a time.]

HORSE THIN—WORMS.

To the Editor: A three-year colt seems well but does not take on flesh. Works good, eats good in barn but stands around in pasture and is nervous. I noticed in her manure a worm 6 inches long and 1/2 inch across.—D. F. F., Lakeport.

[Give tartar emetic 1 dram, iron sulphate 1 dram, arsenious acid 5 grains, once a day for 6 days; then one quart raw linseed oil.]

SWELLING ON COW.

To the Editor: A well the size of your hand and 3/4 inch high came on my cow's foreshoulder 6 months ago. It is twice as big now and is spreading.—J. H., Ramona.

[Have this cow tested for tuberculosis.]

LIVE OAK STOCK FARM

FRANK A. MECHAM ESTATE, PETALUMA, CALIF.

A Mecham Rambouillet.

We are offering for this season a fine lot of yearling rams and ram lambs. Individual or carlots. Write or call and see the flock.

Take electric car either at Petaluma or Santa Rosa for Live Oak station.

We have some choice Red Polled Bull Calves for sale.

American Merinos, Shropshires, Rambouillets

Our flocks are the result of 50 years of careful breeding and selection by the late F. A. Mecham. None but the best are sold or kept for breeding purposes. Sixteen rams selected from P. P. I. E. winners added to flock last fall.

Hillcrest Stock Farm

Thornton S. Glide, Prop.

DAVIS, CAL.

HILLCREST LAD.

First Prize Ram, State Fair 1911. Imported from England 1911.

SHENSTONE CAVENDISH, 8184 Imported from England 1913.

Shropshire and Merino Sheep and Shorthorn Cattle

Shropshires sired by rams imported by me from England. Yearling Rams and Ram Lambs. Individuals or carload lots.

A Few Shorthorn Bulls for Service.

N. H. LOCKE CO., LOCKEFORD, CAL.

Will be at the Live Stock Shows With

Jersey Cattle

and O. I. C. Swine

King's Valet.

With our herd will be a number of young Jersey Bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

Cut Your Feeding Costs In Half

Alfalfa Recutting Attachment

Grip Hook Feed Table

Yes, sir! Clean in two. Don't say you can't. For thousands of farmers are doing it every day. They are cutting their No. 1 hay and mowing their off grades for feeding. They are fattening cattle, sheep, hogs and poultry with the finest alfalfa chop you ever saw. They are making combination feeds of alfalfa with oats, corn and peas. Many are mowing clover, rice straw, bean straw, pea vines and dried cornstalks. Alfalfa, leaves, stems and all—is made into a fine grade of chop without injuring the color of the hay. The only way you can do this and get a positive guarantee of big capacity (1200 to 2700 lbs. of meal per hour) is with the wonderful recutting attachment in sizes 12 to 26.

Smalley

No grinding or hammering. Powerful, whirling, beveled blades cut like a lawn mower. Feed is fine, even and uniform resulting in greater tonnage in the silo. Famous grip hook, force feed table saves work of two men. Wide flaring sides and deep throat on every cutter. Patented, low-speed, one pulley chain drive not only makes a cleaner, faster job, but saves one-fifth to one-fourth power—and runs out unnecessary wear on belt. Blower is built independent of cutter so fan speed can be increased or decreased without changing speed of knife or shaft. Powerfully built for hard, long service. See for yourself how thousands of farmers are cutting feeding costs in two, saving time, labor and power costs; getting better and greater silo tonnage. Send for the handsome, illustrated FREE Book today. It tells the story.

Woodland, California

Farm Poultry for Profit.

SOME FEEDING QUESTIONS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The feeding question is the one on which hangs the problem of profit and loss in a larger proportion than all other questions; therefore, it is usually the one question first asked. Yet it is a question that the individual poultryman or farmer must eventually answer for himself.

What to feed depends so much on locality, and on what your fowls can pick up on range, or on what you can grow the most of and the cheapest, that it is only possible to give some few ideas that will be helpful in making a selection, in cases where all the feed must be bought.

When fowls have a good range, where they can find plenty of vegetable or grass feed, they will also find some insect life; not a great deal, as in our climate insect life is not so abundant as in a climate where summer rains prevail. If this is supplemented with a feed of grain at night and a pan of sour milk, the ration is both wide enough and diversified enough to bring eggs and keep the flock in good condition. If the range is bare of grass, it will also be bare of insect life, and it affords nothing but room to roam around. In a case like this the feed should cover all the needs of the flock and be served as to yarded fowls.

The feed should include vegetable and animal protein, mineral and fat-forming foods. The grain that can be bought cheapest according to locality is usually the best to buy. The soy bean in any quantity is never harmful; and it is rich in vegetable protein. Cottonseed meal is also rich in vegetable protein, but fed in any quantity it is very hard to digest, and is also very constipating. So here are two articles of about equal value in protein, almost equal in price in any locality in the state, yet of unequal merit as an every-day article of food. Cottonseed meal can be fed in a ten per cent proportion of all mash materials used, perhaps without causing much trouble from indigestion, but soy bean meal can be used in a twenty per cent proportion with an assurance of it doing the hens good without any harm.

Alfalfa meal, if fresh alfalfa cannot be had, is high in vegetable protein. While it is better scalded or moistened, it can be fed dry in mash just as bran is, but owing to bulk should never exceed ten per cent of other ingredients. Beef scrap, blood meal, or meat meal must also form a part of all mash; usually fifteen per cent of beef scrap will be found a fair proportion. Blood meal ranges higher in protein and hens should not be fed over ten per cent, and less if it causes any disturbance in the digestive tract. Meat meal is a less concentrated form of animal food and can safely be fed in the proportion of twenty per cent. But all these things must be watched to see if they are causing any disturbance. The way to tell is to watch the droppings; if fowls are perfectly healthy and their feed is rightly proportioned the droppings will always be cylindrical in form

and be tipped with white. There is no exception to this rule. If the droppings change ever so little, to just that amount is the fowl out of proper condition.

Feed whatever grains you are able to get easiest and cheapest; and if you supply the animal and vegetable food in any proper ratio your flock will be healthy and profitable.

Hens Lose Control of Limbs.—My hens seem to lose control of their limbs as if their backs were broken. They refuse to eat and gradually wither away. Some seem to have blind staggers and have to be killed. My half-grown chickens have become afflicted now. The hens have laid well since January.—J. W. B., Fillmore.

[Your flock must have access to something poisonous. The symptoms are those of poisoning from ergot, usually found in the form of grain smut. Look well to your feed; also clean up your premises, as the chickens may be picking it up somewhere. Give all of them a good dose of castor oil in a little mash for the evening meal, then next day make a strong tea of white oak bark and let all drink of it. You can buy white oak bark in packages at any drug store. Remove all old paint cans and other rubbish from poultry yards and premises; they are all sources of danger.]

Telling Age of Hens.—How can you tell the difference between a one year and a two year old Leghorn hen; also how can you tell a good one from a poor one?—T. S., Boulder Creek.

[Usually the legs of a one-year hen are smooth, and should also be yellow in a Leghorn; but common Leghorn stock has been crossed with other breeds so much that the yellow leg cannot be depended on; and even the smoothness is often removed if the hen has been allowed to run in dirty yards. If they are kept clean and well fed the legs will be both clean and smooth. As to telling a good one from a poor one there are but a few that can do that by just being told. But a good hen is usually alert and active, has a bright eye and a fair-sized comb, is always after the feeder when he makes his appearance, is late to go to roost and early to rise. In fact a good Leghorn hen is as full of business as her egg is full of meat; she is an ever-present active member of the hen family that never misses anything except just while she is on the nest.

RABBITS AND COYOTES.

To the Editor: Please help us get rid of rabbits and coyotes. They are destroying grain, grass, corn, and chickens.—Desperate, Bonsall.

[Strychnine in some fresh meat near the coyotes' usual haunts will likely get them. For the rabbits, we adapt answer from "California Fruits."

Pieces of watermelon rind, cantaloupes, or other vegetable of which they are fond, may be poisoned with strychnine and scattered out of the way of poultry. The rabbit does not get far away from it. The same result can be obtained by mixing 100 pounds wheat and nine gallons of water with a pound of phosphorus, a pound of sugar and an ounce of

oil of rhodium. Heat to boiling point, let stand till morning, and stir in enough flour to make a paste. Rabbits eat it with avidity if it be scattered about.]

SHADY SUGGESTIONS FOR HOT WEATHER.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Hot weather has surely been delayed this year; but it has to come, even though it is late, so we must use extra precautions for both old and young stock if they are to do well.

If we have natural shade we are lucky, but I have seen some very good artificial shade that answered almost as well. In these days of high prices for gunny sacks that old-time method is not to be thought of. But almost anybody can get a bundle of laths or a few limbs of trees, even though the trees are dead. Just drive four stakes into the ground, and nail a piece of old poultry wire over it, then spread the brush over that as lightly as possible. Anything that the breeze can get through is far better than a tight shade such as would be made of cloth.

Another good idea is to make a fence, either in a circle or square as convenient. Make rather small and if the fence is made from east to west, leave an opening at both ends, not necessarily very wide, because once the chickens find out they will surely make good use of it. Now along the south side lay a few limbs of light brush; and over the top from south to north open up a couple of old gunny sacks to keep sun out. If you can turn the hose on the ground once a day you have a comfortable place for your chickens that they will appreciate.

We never want to forget that very hot, dry weather is not good egg-laying weather. Hens get overheated and depressed. Then it is no use feeding for eggs, for they won't come until we provide more spring-like conditions.

Feed at Night.—By feeding at night so the hens can eat as soon as they get out, and providing shade during the hottest part of the day, we come nearer to spring. Always see that the water is changed often, especially for small chicks, as they will not drink enough warm, dirty water. Water is just as much a necessity for the growth of chicks as it is for laying hens. And we all know that an egg is very largely composed of water; therefore, if hens are deprived of water, the egg supply will be cut off that much.

Cut out most of the corn or other heating feed. Cut green alfalfa mixed with the mash every day is a great help in keeping the hens cool and in laying condition. Remember, the blood must be kept cool if we are going to get eggs during hot, sizzling weather; keep the blood cool by feeding food that is not fat producing. Alfalfa or good tender cabbage leaves have this cooling effect on the hens; and will be productive of eggs. Of course you will have to give meat, for vegetable protein alone does not fill the bill. Where milk can be had, it is the greatest help, filling the bill as an animal food and vegetable, too, in a measure.

Above all things, remember that neither young nor old fowls can be

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

FALL BROILERS PAY BIG and Fall Pullets grow quickly; lay by spring. We have baby chicks (any quantity), beginning August 5. Barred Rocks, R. I. Reds, Black Minorcas, White, Brown Leghorns, 8 to 13c depending on breed and quantity. Express paid. Chicks that will suit you from best of breeding stock. Send for circular. Roofden Poultry Ranch & Hatchery, Campbell, Cal.

NO BABY CHICKS DURING JULY.—Fall hatching starts in August. Get in touch with us immediately, and assure chicks when you want them. Ask for special "Fall Chick" circular. White and Brown Leghorns, Barred Rocks, R. I. Reds, and Black Minorcas. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each. 2 Electric Incubators, 144 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Volden, Box 390, Los Gatos, Cal.

GET YOUR CHICKS for early Fall broilers. We can furnish them on short notice. White Leghorn, 800 for July 11; 1400 for July 18. Brown Leghorns, Red Rocks, Anconas all coming off the same time. THE SANTA CLARA VALLEY HATCHERY, San Jose, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

WHITE LEGHORN BABIES and Hatching Eggs from Hoganized, heavy-laying strain. Correspondence solicited. The O. C. McDonald Poultry Ranch, King and Jefferson, San Jose, Cal.

BABY CHICKS AND EGGS.—Hoganized Black Minorcas, White Leghorn, stock specialties. Free instructions on raising chicks. Hicks Jubilee Hatchery, Petaluma.

BABY CHICKS.—Strong and healthy, from high-bred free-range White Leghorn stock. Prices on application. Western Hatchery, W. S. Waldorf, Petaluma, Cal.

HERE IT IS.—White Rock baby chicks, \$15 per 100. Hatching eggs, \$1.50 per 15. From selected winter layers. Mrs. J. B. Tupper, Oeres, Cal.

DAY-OLD CHICKS.—These chicks are hatched from our own stock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

S. C. RHODE ISLAND REDS.—Bred to lay. Hatching eggs and baby chicks. Cocks and cockerels. B. C. Quisenberry, R. 4, Lodi, Cal.

WHITE WYANDOTTES.—Blue-ribbon winners. Eggs, \$2 to \$5. Chicks, pullets, cockerels. B. W. Staweski, Route 2, San Jose, Cal.

TRAPNESTED LEGHORNS.—White and Buff Stock Eggs, chickens. Arthur B. Schroeder, Box 179B, Mountain View, Cal.

ORPINGTONS.—Buff and White and Black Minorcas. Selling out. Mrs. S. Swaysgood, Route No. 2, Pomona, Cal.

CHICKENS, DUCKS, GEESSE, GUINEAS, PEA FOWL. Address Wm. A. French, 545 W. Park St., Stockton, Cal.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks. Choice cockerels. Fairmead Poultry Farm, Fairmead, Cal.

SINGLE COMB Rhode Island Reds. Eggs and stock for sale. Dirk Dairy Farm, Lemoore, Cal.

FURKEYS, DUCKS AND GEESSE

INDIAN RUNNER DUCKS.—Imported Stock. Absolutely Pure-bred. Tested Layers. Breeding pens. 6 ducks and 1 drake, or separately. Fancy stock at reasonable prices; hatching eggs. W. B. Anderson, Lafayette, Cal.

HART'S BRONZE TURKEYS AND EGGS.—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clements, Cal.

PEKIN DUCK EGGS for hatching, \$1.00 per dozen. L. D. Collins, R. F. D., 546, Denair, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

One of the most interesting places I have visited in my southern trip was a country home. This home was not pretentious, but it had trees around the house and a lawn in front with verbenas bordering the roadway, which gave a very pleasing effect to the passerby. Across the front of the house ran a porch which had been entirely screened, and on this beautiful out-door room there was a big couch with denim covering, comfortable chairs and the sewing machine and mending basket. I thought it was certainly an ideal place for the man of the house to rest for a few moments after meals, and a useful spot for the small children to sleep and the mother to mend. One end was sunny and there hung a slat curtain that could be raised or lowered at will.

This place had water piped into the house and a tank for hot water in the kitchen connected with the range. This made it possible for the wife to use a dish drier, which is a wire tray on which the dishes are placed after washing. They must then be well rinsed with hot water, and then allowed to dry, when they are ready for use again. She told me that there was not only time saved by not wiping dishes, but much washing of dish towels.

The morning before I arrived she had been ironing, and across the back porch had been hung a heavy cord to which were suspended by the snap clothespins all heavy garments that were not thoroughly dry; this let them dry in shape before they needed to be folded and put away.

After the noon-day meal had been cleared away, we went out to look at the yard and garden. The children had a very attractive playhouse made of posts set in the ground with a roof of palm leaves. The sides had quick growing vines, so the rays of the sun were tempered. There was a swing there and small seats that the father had made for them and all the playthings that were in constant use. The driveway at the side of the house had been oiled and graveled to try and keep down the dust during the summer and the mud during the winter months.

The windows on the west of the house had lattice work frames curving from a few feet over the glass to several feet from the house on the ground. These provided a trellis for vines which sheltered from the sun without obstructing the breeze.

Nearly all of these little comforts for the wife and family were the work of the man of the house, so the expense connected with them was not great as compared with the help they were. Devotedly,

Rosabella Best.

DYEING WAISTS AT HOME.

If you have an old crepe-de-chine waist that has grown yellow from washing, try making it a delicate green by adding to your rinse water a piece of green crepe paper. A little experimenting will enable you to decide whether the water has color enough in it.

APRICOT AND PINEAPPLE MARMALADE.

Stone 10 pounds large apricots and cook slowly until soft. When almost done, add 8 pounds sugar and let simmer for 3 hours. Take a large can of sliced pineapple, cut into small bits, add to apricots, and cook until thick. Can in jars or pour into jelly glasses. A few broken walnut meats may be added. It is claimed that dried apricots can be prepared in this same way and make a very good marmalade.

FASHION NOTES.

The new washable corset will prove a boon to the woman who lives and works in the hot districts. It is claimed they can be washed just like any undergarment.

Rubberized rompers are being shown in one of the big department stores. These are just like other rompers only that the water does not penetrate them and are fine for the little people who are wading either at the beach or in streams.

At last, the long threatened has arrived. Hoop skirts made of net, with three rows of feather boning are being shown in the stores.

Towel sets, consisting of bath towel and wash cloth of corresponding pattern are among the new novelties.

Everything in blouses is still long-sleeved although the necks are nearly all low.

Cording is a very popular trimming and you can make the cord you wish to cover any size by taking twine and twisting it and doubling back until the required thickness is arrived at. An easy way to twist the cord is to fasten one end to the bobbin wind on the sewing machine and have the other end held tight and run the machine.

There is a new stitch for trimming garments that is very effective and is really not difficult to do. For the bobbin, instead of thread, use an embroidery silk of the desired color and then stitch on the wrong side of the garment, so that the heavy bobbin thread makes the stitching.

CAULIFLOWER.

Cauliflower will not seem like the aristocratic vegetable it purports to be unless it is carefully cleaned and cooked with care. Even then it will not equal "mock cauliflower" in delicacy unless it is properly dressed and seasoned.

Creamed Cauliflower I.—Trim the outside leaves off a nice head of cauliflower, put on to boil in slightly salted water to which has been added a little milk. Boil thirty to thirty-five minutes, drain, and make a cream sauce to pour over it as follows: Put in a saucepan one tablespoon of butter, let this melt and stir in a tablespoon of flour. When hot pour in one and a half cups of milk, stir briskly and boil two or three minutes, now add a little salt and grate a little nutmeg over it.

PRESENCE OF ADENOIDS.

One of the distinguishing features of the presence of adenoids in children is mouth breathing and the throwing of the head backward in sleep.

THE ELEMENTS OF MAN.

During the hearing of a case involving a small domestic dispute the judge declared that "a patriot is a man who refuses to hook up his wife's lingerie waists. And a martyr," he went on, "is one who tries and fails; while a hero tries and succeeds."

"Then how would you define a coward?" asked the lawyer, who was a bit of a wag himself.

"Oh, a coward," replied the judge, "is a man who stays single so he won't have to try."

VARNISH STAINS.

Editor Home Circle: Would you kindly tell me what would take varnish out cotton cloth?—M. E. W., Corning.

Soaking in lye water, followed by washing is good for overalls, but would not do for fine fabrics.

CARE OF THE TEETH.

The preservation of the teeth rests largely with the care that is given them, but of late, many eminent physicians are claiming that many diseases, heart trouble and rheumatism most particularly, are aggravated by neglecting the care of the teeth and throat.

GLASS STAINS.

If your glass dishes have been used for flowers and become stained with water, use muriatic acid on a small piece of cloth to remove the stains. This is a poison and must be handled carefully and kept out of the reach of children.

SCOURING KNIVES.

The cleaning of steel knives is made much easier if you have scouring brick in a small box with one end removed so that it can be hung up. Use a cork instead of a cloth to scour with.

WIRE TRAYS.

Wire trays are a great convenience for placing hot cake or bread on. The supports which lift the tray from the table allow the passage of air and prevent sweating.

At a certain military hospital a dear old lady could never see that the Tommies objected to her fussing round, and none of the staff had the heart to enlighten her ignorance. "I didn't know you had Russian soldiers here," she said one day. "Russian? We don't," replied the official. "What do you mean?" "At least one is Russian," insisted the old lady. "He told me his name." "Did he?" "Yes, I was asking them about their wounds and what their names were, and this one replied, 'Obuzzoff!' "—Pearson's Weekly.

FLORAL DEPARTMENT.

(By Geo. N. Tyler.)

In my last article on carnations there was a typographical error: use a 2½ inch potful of bone meal, instead of a 12½ inch potful, across a four-foot bench. As soon as the plants begin to send up flower shoots, I give supports; I stretch wire the full length of the benches, about six inches above the soil; and every eight feet, tack a wooden strip across the bench to hold the wires in place. The wires are run between the plants. I then run string across the benches between the plants, taking a turn around each wire. I then put a second support twelve inches above the first or eighteen inches above the bench. These supports insure straight stems and allow the air to circulate around the plants. I do not do any feeding till March, as it is liable to cause the flowers to burst the calyx and the result is a crop of split flowers. In March, I give a light shading on the glass. In the meantime I ventilate night and day. I do not use heat of any kind; but where I do not get a lot of flowers in the winter months I get better and larger flowers later. And the cuttings that I get from the plants make much stronger and more vigorous plants the following year. I take cuttings from only the most vigorous and strongest plants and those that are the most prolific in bloom. In this way I increase the vigor of my stock and in a few years I have a new type of carnation, cold resisting and winter blooming. This is the Burbank system of selection. Instead of a variety running out in a few years from forcing and over-production of cuttings, it gradually increases in vigor.

Disease-free Plants.—Out of five thousand plants that I handled last fall I lost just one from disease, while most of the growers lose ten to fifty per cent of the transplanted stock. I owe my success to the lime-sulphur mixture that I dip plants into when moving them from the field and keeping them free from aphids and other pests.

The aphids I smoke once a week with tobacco dust. I make little piles on the ground in two or three places in the house, pour a few drops of coal oil on them, light them and they burn most all night. For red spider I spray with the lime-sulphur mixture that is described in a former article. I have tried many remedies for red spider, but this mixture that I use does not burn the flowers or cause them to get sleepy like other mixtures of sulphur, and the lime causes the sulphur to stick on the plants and give out the fumes that kill the young spiders as fast as they hatch out. Two applications a week apart will rid a house that is badly infested and it dries up all diseased leaves. The new growth comes clean and green. Water will not wash it off. You can spray any time with clear water; and afterwards the fumes of sulphur can be detected in the house.

Worn table cloth makes good ticking for cushions.

WHEN ELLIE WENT TO RIDE WITH GRANDPA.

"Oh, are you going to the post-office, grandpa?" cried Ellie, the very first morning after she reached the parsonage in Littleton for her summer's visit. "May I go too? May I, Grandpa?"

"Run in and get your sunbonnet, Ellie, for I'm ready to go," said Grandpa. Of course she could go; that question needed no answer. How could Grandpa ever think of going to town without a little girl to hold the reins for him when he wanted to think about his sermon, or to remind him that Grandma wanted him to get oolong tea this time, not just tea?

Rex was used to these trips back and forth, and trotted as fast as though Ellie were not a whole year bigger than last summer. And the high, old-fashioned buggy rattled just as noisily as ever.

It was Tuesday morning, and Grandpa didn't want to think about the sermon which he had preached on the Sabbath before, and he wasn't ready to begin thinking about next Sabbath's sermon quite yet, so Ellie could talk all she wanted to, and she and Grandpa sang "My days are gliding swiftly by" and "I'm a pilgrim" where there weren't any houses along the road. Grandpa pointed out to her the compass-plant, which would always tell her which way was north, and showed her how all the tall sunflowers were saying good-morning to the sun.

Ellie was so glad that the post-

office had been moved three miles way from the parsonage long before she was born, though Grandma always said every morning when they started off: "It's just a shame you have to take that long drive. We ought to have the post-office where it used to be."

When they stopped at the office, Ellie carefully held the reins while Grandpa went in for the mail. Rex stood just as still as though he were tied to a hitching-post, for there wasn't even one green leaf or spear of grass within reach to tempt him.

"Good-morning, Ellie," said a pleasant voice. "Have you come back to help your Grandpa drive, this summer?" And Deacon Templeton came up holding out his hand to greet the little girl. She looked anxiously at the horse, but dropped one rein and politely shook hands with the old gentleman. She almost wished she hadn't come when Mr. Clark, who kept the store where the post-office was, came out to greet her also; and she quite wished so when the two young lady clerks and the "Professor," who was buying some new pencils, although school wasn't keeping, all came out to say how-do-you-do.

"Well, Ellie, what grade are you in now?" asked Professor Allen.

"I'm in the—" Ellie was saying, when there came a funny little rush and tumble right under the buggy seat. Out scrambled Puck, Ellie's little bantam rooster, which lived with Grandpa because Ellie had to live in the city and could not keep bantams or rabbits or any of the delightful pets which she so much wanted. Up the little fellow hopped right on to the dashboard, and out came Pam, his demure little mate, and hopped up beside him. Pam kept quite still, but Puck began cackling his loudest right into the Professor's face, then crowed joyously to the whole crowd. He kept on crowing and cackling until Grandpa came hurrying out to see what was happening.

"Ha! ha! ha!" he laughed, and the whole group began to laugh too. This time Ellie quite forgot the reins. She climbed down and looked behind the leather curtain of the seat.

"O Grandpa," she cried. "O Grandpa! See here! Pam has laid an egg right under the seat!" And she triumphantly brought out a little white egg which caused all the commotion.

"Wasn't that dear of her! Pam laid it right under the seat, Grandpa,—right under the seat while we were riding." Ellie beamed upon the crowd, her timidity quite forgotten.

"I knew you were a kind-hearted man, Mr. Mason; but I didn't suppose you would carry your kindness so far as to take your poultry out for pleasure drives."

"Oh, Professor Allen," explained Ellie, "they stole the nest, you know. We didn't know they were there—really we didn't."

On the way home Grandpa had to drive, for Ellie carried Puck under one arm and Pam under the other, while in one hand she kept carefully the little white egg.

"Grandpa, this is the funniest and nicest drive I ever had," said Ellie when she was lifted down from the buggy, with her pets; "but I think next time we'd better look under the buggy seat before we start, don't you?"—A. L. Pierson, in the Churchman.

MAKES ANTS DISAPPEAR

AT ALL DRUGGISTS

In Your Shoes All Day

Out in this hot, sweltering weather, tramping over the farm from morn to night—that's the kind of wear that's hard on socks. That's why the ordinary socks you buy go to pieces quickly and make your feet sore and blistered. Wear Durable Durham Hosiery, and when you kick off your shoes at night, you'll find it holeless and your feet comfortable.

DURABLE DURHAM HOSIERY

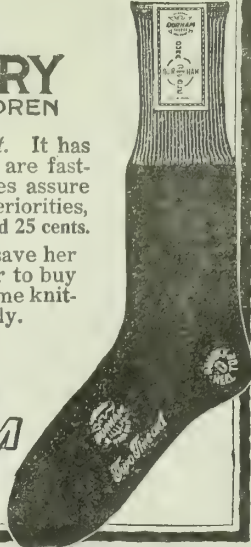

FOR MEN, WOMEN AND CHILDREN

is made strongest where the wear is hardest. It has reinforced heels, soles, toes, and the tops are fastened on for keeps. The famous Durham dyes assure fast, sanitary color. With all these superiorities, Durable Durham Hosiery costs only 10, 15 and 25 cents.

Tell the wife about this hosiery that will save her hours and hours of darning work. Tell her to buy Durable Durham, the hosiery that makes home knitting expensive, for everybody in the family.

Your dealer should have Durable Durham Hosiery in stock. Have him show it to you and also the 25-cent Durham Mercerized Hose.

San Francisco, July 12, 1916.

WHEAT.

Northern grades are entirely nominal in this market, as there is practically nothing coming in from that direction. The light supply has caused a slight advance in local offerings on the spot.

Sonora Wheat \$1.70 @ 1.72 1/2
Northern Club 1.70 @ 1.72 1/2
Calif. Club, ctl. 1.70 @ 1.72 1/2
Northern Bluestem 1.82 1/2 @ 1.85
Northern Red 1.80 @ 1.90

BARLEY.

Holders are taking quite a firm attitude as to both spot and future barley, and with a strong rail movement and prospects of better sea shipping conditions, both grades have been marked up a little.

Shipping, ctl. \$1.40 @ 1.45
Choice Feed, ctl. 1.37 1/2 @ 1.40

OATS.

New oats are coming in rather slowly, and with a light crop in many sections values show more firmness. Recleaned stock is held still higher, but there is no demand for seed yet.

Red Feed \$1.45 @ 1.50
White 1.55 @ 1.60

CORN.

Eastern yellow is quoted slightly higher, in conformity with advance in primary market. Not much movement here. The sorghum grains are steady, with fairly active demand at many outside points.

Eastern Yellow, ctl. \$1.85 @ 1.90
Milo Maize 1.40 @ 1.45
Egyptian 1.45 @ 1.50

BEANS.

Bean prices stand as last quoted throughout the list, having been practically same for two weeks. The market remains firm, with strong demand for shipment to outside markets, though the movement is limited by the closely cleaned-up condition of spot market. Stocks are light in consuming markets, and if the demand continues some further advance may occur, though in several lines values are higher than ever before. The present condition is of course temporary, and while a few early lots of new beans may bring extreme prices, larger offerings will no doubt bring a general weakening. Growers are taking a firm view, and are not disposed to sell their crops in advance. Some new small white contracts at \$5 to \$5.50 have been reported at Salinas, but local buyers who visited that district did not succeed in doing any business.

(On wharf, San Francisco.)

Bayos, per ctl. \$6.25 @ 6.50
Blackeyes 3.50 @ 3.75
Cranberry Beans 6.00 @ 6.20
Horse Beans 3.25 @ 3.40
Small Whites (south) 9.75 @ 11.00
Large Whites 9.25 @ 9.50
Pinks 6.96 @ 7.25
Limas (south) 6.50 @ 6.75
Red Kidney 8.00
Mexican Reds 5.50 @ 5.60
Tepary Beans 4.50 @ 4.75

HAY.

The local market remains in a slow and uninteresting condition, with city consuming requirements comparatively light and the trade generally showing little anxiety to buy beyond present needs. This is largely due to the difficulty of shipping during the dock strike, and uncertainty as to future. Current arrivals, however, clean up well, and growers generally holding firmly, feeling that buyers are under a misapprehension as to season's production and that better values will prevail than are now obtainable in the city market. In fact, numerous reports are received of country sales at higher figures than those quoted here. The principal movement has been of the better grades of hay, of which there is a large proportion in some nearby districts. Values already show a slight improvement here, the lower grades of wheat hay being a little stronger, while the choicer offerings of alfalfa are \$1 per ton higher.

Wheat, No. 1 \$13.00 @ 13.50
No. 2 10.00 @ 11.50

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, July 10, 1916.

The shipment of Bartlett Pears is at its height and as a large percentage of the Sacramento river growers are now moving their stock to canners at \$50.00 a ton, the Eastern shipment will be light from the middle of this week.

On account of heavy drop in the Suisun and Cordelia districts, growers were forced to pick their pears earlier than they would have done, expecting to wait until the heavy receipts from the Sacramento river were finished.

There has been a strong active demand for all varieties of Plums and peaches and this will undoubtedly continue throughout the season, or at least up until the first of September, as by that time tree fruit shipments from California will be practically completed. Very little competition has been felt to date from Eastern peaches, though the movement from Georgia averages from 100 to 150 cars a day.

California Elbertas are now moving in light supply from the San

Tame Oats 11.50 @ 15.00
Wild Oats 10.50 @ 12.50
Barley 10.50 @ 12.50
Alfalfa 10.00 @ 14.50
Stock Hay 7.50 @ 9.00
Straw, per bale25 @ .40

These quotations furnished by Nicholls-Loomis Co., Los Angeles, Friday, July 7th:

(Prices as paid to producers.)

Hay to producers, according to quality, f. o. b. Los Angeles, is quoted as follows: Prices to consumers \$1 to \$3 per ton higher, according to quantity ordered, delivery, etc. Prices per ton,:

Barley Hay \$10 @ 14
Wheat Hay 10 @ 14
Tame Oat Hay 12 @ 16
Northern Alfalfa 11 @ 13
Local Alfalfa 12 @ 15
Stock Hay 6 @ 9
Straw 5

FEEDSTUFFS.

The only change is slight advance in rolled oats, to correspond with firmness of whole grain. Rolled barley is firmer.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet pulp, per ton Nominal
Alfalfa Meal, per ton 17.50 @ 20.00
Bran, per ton 28.00 @ 29.00
Oil Cake Nominal
Cocoanut Cake or Meal 23.00 @ 25.00
Cracked Corn 40.50 @ 41.50
Middlings 35.00 @ 38.00
Rolled barley 29.00 @ 30.00
Tankage 45.00
Rolled Oats 30.00 @ 31.00

VEGETABLES.

The vegetable market has slumped badly in the last day or two, as the strike is delaying shipments, and large quantities are held over from day to day. Asparagus is extremely weak, receiving but little attention from consumers, while the cannery season is over. Cucumbers are in

Joaquin Valley and Placer county. Elbertas will be ready for shipment next week. We look for a strong demand at very satisfactory prices.

The shipment of Imperial Valley Malagas is about completed and this variety of grape from the Fresno district will be ready for shipment about the first of August. Tokays are sizing up well and will be about two weeks earlier than last season.

The following prices have ruled for the week:

New York—Tragedy plums averaged \$1.15; Santa Rosa, \$1.10; Burbank, \$1.02; Climax, \$1.08; Kelsey, \$1.66; Abundance, 70c; Wickson, \$1.42; Bartlett pears, \$3.00; Hale peaches, 70c; St. John, 77c; Triumph 68c.

Chicago.—Bartlett pears, \$2.73; Tragedy plums, \$1.48; Diamond, \$1.40; Burbank, \$1.19; Santa Rosa, \$1.34; Wickson, 83c; Royal cots, \$1.73; Thompson Seedless, \$2.32; Crawford peaches, \$1.16; St. John, \$1.06; Hale, 83c.

Total Shipments to July 10, 1916 cars; total shipments same date 1915, 1951 cars.

excessive supply and cheap, summer squash even cheaper, while okra holds fairly firm. Beans and peas are also well maintained. Bell peppers are lower, tomatoes are arriving in lugs from several points, causing an easier feeling. Green corn moves slowly; with large offerings prices are rather irregular.

Cucumbers, lugs 50 @ 75c
String beans, lb 3 @ 5c
Summer Squash, lugs 40 @ 50c
Peppers, bell, lb. 4 @ 6c
Asparagus, box 50 @ 60c
Eggplant, lugs \$1.00
Peas, lb. 2 @ 3c
Tomatoes, lugs 1.00
Green Corn, sack \$1.00 @ 1.25
Okra, lb. 5 @ 7c

POTATOES AND ONIONS.

Potatoes are as firm as ever, with light arrivals and large shipping demand, choice lots move readily at \$2.25 per ctl. The Delta onion crop is beginning to arrive, and prices are somewhat easier, though still high.

(On wharf)

Potatoes, ctl. Delta \$1.50 @ 2.00
Southern 2.00 @ 2.25
Onions, red 2.00
Yellow 2.00 @ 2.25
Garlic, new crop, per lb ... 5 @ 6c

POULTRY.

There has been a little stiffening up this week as the demand has shown more life, though young stock is coming in too freely to clean up readily. More firmness is noted on small broilers, hens and the best offerings of young roosters.

Broilers, 18 lbs. to doz. and less, lb 20 @ 22c
do, over 18 lbs. to doz. 21 @ 22c

DECIDUOUS FRUITS.

The fruit market shows comparatively little change, being rather firm for this time of year. Arrivals in most lines moderate, and there are few large accumulations of poor stock to hold prices down. Strawberries show a narrower range, fancy lots being easier, while common stock is higher. Blackberries have eased off slightly, with currants firm. Attractive lots of apples are quite steady, and country prices are said to be satisfactory to growers. Pears are well maintained, with light offerings. Apricots show less firmness, a good deal of unattractive stock appearing; peaches in good demand and steady at former level, good basket stock finding ready market. Black figs are well taken at slightly better prices. Plums and nectarines arriving more freely, with corresponding decline. Cantaloupe offerings have decreased and prices higher; watermelons comparatively high for this season. Grapes show some firmness.

Currants, chest \$4.00 @ 4.50
Loganberries, chest 2.00 @ 3.00
Blackberries, chest 3.00 @ 4.50

DRIED FRUITS.

The dried fruit market is gradually showing more activity, as more of the packers and growers are getting together on prices, though there will doubtless be a great deal of fruit unsold for some time. Old apples are closely cleaned up, a sudden revival of demand has brought a sharp advance. A few new apples have been contracted at 6c, but figure is not well established. Packers have reduced offers for apricots slightly, and state that crop in the San Joaquin has been pretty well bought up with 13 1/2 c as the extreme top figure, though Santa Clara growers are firm in their demand for 15c.

Special Livestock Market Report.

Cattle.—There is no quotable change in local buying circles, although offerings continue larger than can be well cared for. Good, medium weight cattle are steady to firm in dressed meat circles, and cheaper cuts are also finding a rather stronger demand.

Sheep.—Mutton demand is rather poor locally, dressed wethers selling at 13 to 14 cents, ewes 12 to 13 and spring lambs 16 to 17. Only a few California sheep are arriving, the bulk of the supplies coming from Oregon, with a few scattering shipments from Nevada.

Hogs.—Hogs are a quarter cent higher and receipts a third off from

those of the week previous. The falling off in receipts is expected at this time of the year which is the tail end of the dairy hog season and the stocking up season for stubble feeders. The fresh pork market is steady to firm, lightweights selling well.

Wool.—There is no reportable change in quotations, the market continuing strong. The London sales opened July 13, five to seven and a half cents stronger on Merino grades, but this can have no effect locally. The Boston market is proving disappointing to local buyers as it is ruling lower than our quotations, making it impossible to ship from here to that market with a profit.

Figs unchanged, but very firm. Spot prunes nearly cleaned up, and a few have moved at a slight advance, future Santa Claras are slow with buyers and sellers apart in their views. A fair movement is reported in other quarters. There are some Eastern interests who apparently regard the 6c price as justified but none are willing to pay that figure except for pressing needs. The new prices on seedless raisins were well received, and it is announced that the entire estimated crop was sold immediately, the Associated Company now refusing to book further orders.

Apples, old crop 7 @ 7½ c
Apricots, per lb, 1916 12 @ 13 c

CITRUS FRUITS.
Eastern markets as a rule are strong for citrus fruits. In New York July 10, 25 cars Valencias averaged \$2.45 to \$5.20; grapefruit averaged \$2 to \$3. At Boston, Valencias averaged \$2.55 to \$4.60; lemons \$2.60 to \$4; grapefruit in half boxes \$1 to \$1.30. At St. Louis Valencias \$3.30 to \$3.75; lemons \$3.05 to \$4.05; grapefruit \$3.70.
There is little new to report in this line locally. Lemons and grapefruit are in seasonable demand at old prices, oranges remain steady, while the top price on lemons has been marked down a little.
Oranges, Valencias \$3.00 @ 3.50
Grapefruit 2.00 @ 3.00
Lemons, box 2.75 @ 4.50
Lemonettes, box 1.50 @ 1.75
HONEY.
Honey prices are still rather firmly held, as all reports so far indicate that the new crop is light.
Water White, comb 13 @ 15 c
Amber 10 @ 12 c
Water White, extracted . . . 9 c
Light Amber, new 4 @ 6 c
Dark 4 @ 4½ c
NUTS.
Prices are quoted for the new almonds, based on what has been paid by packers for a few scattered lots. Apparently the bulk of the crop is going to the Exchange, as that organization has already 260 more members than last year, making 1079 altogether. The Exchange prices to the trade will not be announced until September.
(Prices offered by packers.)

Drakes 13 c
GROCERIES.
Low and medium priced coffees are dull and easy, with large stocks. All kinds of canned and cured fish are firm at high prices. Flour is quiet but steady at \$6.40 to \$6.80 from mills.
HORSES.
There is not much new in the local situation, the larger horse users taking only moderate interest in offerings, and picking up a few of the most attractive animals. There has been nothing of much interest offered for the last week, and local dealers complain that it is difficult to get anything at prices that will permit of resale in this market, owing to the cleaning up by war buyers. Several lots of mules have been offered here of late, but few are wanted for local use. Large shipments of mules for war purposes have been

sent from the Sacramento valley this week.

PORTLAND LIVE STOCK REPORT.
North Portland, Ore., July 10.
Cattle.—Receipts were fairly liberal today with an excellent price outlet. Best steers sold as high as \$8.50 and cows at \$7.00. Even very common steers brought close to the \$8.00 mark, and taking the market as a whole excellent strength and advances were prevalent in all classes.
Hogs.—An advancing hog market on little heavier receipts was the feature of the day. Top hogs sold at \$8.90, an advance of 30 cents over last week. Bulk of sales \$8.70 to \$8.80; market closed strong.
Sheep.—Sheep prices were well in line with last week. Top lambs were \$8.25 and all others classed in line with former prices. Market closed steady.

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th, upwards of four and a quarter million bushels being exported in less than six weeks, and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common. Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc. There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

Publisher's Department

We receive many letters asking for advice in helping solve problems, and where the letters are properly signed, we are always pleased to do our best in replying. Some days we receive as many as fifty such letters and it is some effort and expense to take care of the correspondence entailed. Among these requests we frequently get letters signed "reader," "subscriber" or "xyz," etc. These letters are not answered. Our "query and reply" department is maintained for the benefit of subscribers, and unless a subscriber's name is signed to the letter we cannot be expected to reply, as only a fraction of the queries received are answered through our columns, the rest being written to directly. Kindly sign your letters and give post-office address and we will do our part as quickly as possible.

Yet another poultry raiser has developed into author; this time Herbert W. Brown of Saugerties, N. Y., with "A Living from Eggs and Poultry." The author announces he has written for the encouragement as well as a warning to persons desiring to make a living from chickens; that he has no interests to serve in exaggerating pleasant features or withholding unpleasant truths—just plain, unvarnished facts as he met them and gives for what they are worth to those desirous of building up a little plant of 1000 or so hens. Preparation for Robber Cow Competition

Intending contestants for the California State Dairy Cow Competition, which starts November 1, and will continue till March 1, 1918, may well begin preparation now.

[Written for Pacific Rural Press.]

THE main reason why farmers continue to keep "robber cows" or "boarders" is that they do not know how much milk or butterfat the different cows produce, how much feed they consume, or its cost. Such has always been the belief of this journal, as has been shown by the mass of evidence, supporting more progressive methods, which has appeared in these columns for 45 years.

It was to supplement this fight against poor cows and poor methods that we first suggested, about a year ago, the holding of a State dairy cow competition under the auspices of the University of California, which would be wide enough in its scope to reach every part of the State in which dairying is carried on with grade or purebred cows.

That the plan met popular favor was shown by the immediate and generous support of breeders and business concerns, who subscribed several thousand dollars to a prize fund, as well as much valuable dairy equipment. But apparently other agricultural journalists opposed the effort because they did not start it, and they were able to retard the enterprise for eleven months—until Nov. of this year.

While it is still three months before the commencement of the contest, the necessity of preparedness is fully appreciated by those who have had experience in testing cows. In the hope of enlarging this knowledge for the benefit of all contestants, this journal has acquired, by special writers, an even larger number of experiences for publication than usual, which will be printed in forthcoming issues.

In view of the fact that the coming contest is largely a duplication of the Wisconsin Dairy Cow Competition, held during 1910 and 1911, the present article will deal primarily with experiences secured at that time and later compiled for general distribution by the University of Wisconsin, by F. W. Woll, who will supervise the California contest.

What Cows.—First of importance to all intending contestants is, what cows are eligible? In the Wisconsin contest, as in the coming California contest, any cow, either purebred or grade was eligible, the breeds competing among themselves for the main prizes as did the grades among themselves, special prizes, however, being given for the best cow, or groups of cows, irrespective of breeding. That young cows might be given a fair chance, a certain percentage was added to the records of those under 5 years, according to their age.

While it is generally conceded that Wisconsin cows are, on the

whole, higher producers than California cows, the fact that the Wisconsin contest was started six years ago, when, it is probable, the average production there was no higher than it is in this State now, leads to the assumption that records of winning cows in the Wisconsin contest are fair standards for intending California contestants to go by, in entering individual cows or herds.

Of the 395 cows for which yearly records were secured, which number will undoubtedly be greatly exceeded in the California contest, nearly two-thirds of the cows produced over 400 pounds of fat during the twelve months. As the California competition will only recognize a ten-month lactation period this average may, perhaps, be lowered accordingly.

Eight per cent of the records came below 300 pounds of fat for the year, 28 per cent were between 300 and 400 pounds, 39 per cent between 400 and 500 pounds, 17 per cent between 500 and 600 pounds, six per cent between 600 and 700 pounds, and two per cent over 700 pounds.

A requirement of the Wisconsin competition was that all cows should be safely in calf five months after freshening, to compete for prizes. In the present contest it is proposed to limit this to four months; and it is important to know that of the total number, 20 per cent of the Wisconsin cows were not bred within that period and were therefore not given prizes. This should be taken into early consideration by intending contestants.

The Best Cow.—The highest producing cow in the first competition also produced the largest net profit of any cow in the competition, having produced 888.157 pounds of butterfat during the 12 months at a cost for feed of \$129.40, this indicating that high-producing cows in the coming competition will consume large amounts of feed, but at increased profits.

The owner of this cow supplied the information that prior to her entrance in the competition she had made a yearly record of 613 pounds of fat in a local cow-testing association and that she was dry, but in a thrifty condition, a little over a month before freshening. She was fed a grain ration, and silage and clover hay for roughage, the former being cut down after the first eight months when she went down in production. He states that it was his object to keep her in about the same condition of flesh, that she was supplied with plenty of fresh water and was milked four times a day, finishing her year's work apparently in good condition.

The 10 Best Cows.—The winner of the first prize for the largest production by ten cows in a herd secured an average yearly production of 589.695 pounds for his 10 best cows. In his opinion, it is necessary that a cow to produce heavily must be raised right as a heifer. He also advocates the feeding of a great deal of roughage before the first calving.

When his cows were in the competition they were fed and milked three times a day for the first eight months, after which they were fed and milked two times a day, punctuality in feeding and milking being a

(Continued on page 88.)

Purebred sires, wide variety of feeds, and continual selection for high production by weighing and testing milk, have led to unusually high herd averages in Humboldt county dairies.

THE WEEK.

THE crowning agricultural event of the passing week is unquestionably the signing of the congressional rural credit bill by President Wilson on Monday, July 17. This is likely to be regarded by coming generations as most significant in the history of American agriculture, for it opens the way to the capitalization of farming on terms as favorable as those commanded by commerce, transportation and other forms of big business. The law, of which we gave an operative outline in our issue of July 8, provides institutions and ways and means by which farmers can secure loans by their own co-operative initiative and will be helped thereto by the treasury of the United States. This may develop into one of the greatest financial activities of the country, but no one can measure it now, except by his own favor or prejudice, because we have no American experience to teach us. This, however, seems a conclusion which is warranted by experience: if the attitude of individual capitalists and of great financial establishments to agricultural credit changes as much toward generous favor during the first five years of the operation of the new law as it has during the five years of discussion preceding its enactment, it will matter rather little whether the transactions under the law be small or great. Banks are certainly beginning to do things toward fairer financing of agriculture which a few years ago they would have sworn themselves idiots for even dreaming of. No one can now say that they will not yet beat Uncle Sam at his new game of helping farming. They can do it if they wish: it is up to them. They too have the advantage on their side: they have plenty of money and plenty of desire to trade in bonds. They too can trade with the unorganized, up-standing farmers singly, if they wish, and they can handle such farmers in large or small loans as their wishes and security may warrant. Their advantage is that American farmers as a rule prefer to deal man with man than bunch with bunch. It will be interesting to watch and see how they will adjust themselves to keep in touch with the greatest dependable money-using class of our population. We have an idea that the new law may endow agriculture with fairer prosperity not more by what it will directly do for them than by what it will force other custodians of capital to do.

Thus, it seems to us, the responsible farmers of the country may catch the capital they need, both coming and going, as one might say. The event which opens a vista to such a condition is surely of great national importance, and for this reason we present, on another page, a picturesque word-sketch of the way it was done in Washington on Monday of this week.

FINDING OUT WHAT COWS CAN DO.

WE ARE throwing a lot of heavy dairy shells in this issue for the purpose of clearing a path for the solid-column advance against worthless cows, announcement of which we expect to make soon. This is really the same

attack which we launched last December and which failed because our allies were scared off by the cry-baby tactics of rival infantry. It was a great mistake, because caterwauling should not have been allowed to pervert a purpose for which the agricultural press should present a solid front. It was indeed rather a sad spectacle of inconsistency for California journals which are preaching co-operation to their readers to fall to impeaching each other and refusing to co-operate on an enterprise which they all approve. But we will not scold any more about that: it has gone into history and has caused everybody to lose about a year's time. But now we are to make a fresh start and we hope all will resolutely advance together. The movement will respond to the same initiative (which was manifested in our issue of December 25, 1915) because delaying a thing which has started cannot destroy the primal impulse of it. It will proceed in the same way that was first pronounced; that is, under the personal supervision of Prof. F. W. Woll of the University of California. It will follow the same methods, will hold in view the same purposes and will move toward attainment of the same beneficent ends and there will be the same stimulants to interest and reward full activity. Let all who have good cows and are treating them well, keep their eyes wide open for the coming announcement and get ready to start in the race for which it will prescribe conditions.

EARLY EFFORTS TO ATTAIN COW VALUE.

EFFORTS to find the value of cows in terms of their product are not altogether new to this writer. Upon page 84 of this issue is an abstract of work which he did in the cheese districts of New York State 41 years ago, to demonstrate how much better some dairy herds were than others. The method chosen to demonstrate this fact was quite satisfactory. All the herd owners were sending milk to co-operative cheese factories, the managers of which were forced to compute very accurately each contributor's share of the money secured by the sale of cheese, because every man's eyes were upon him and every man's tongue ready to cry out if he could see any discrimination of a fraction against him. As the factory books contained record of every pound of milk furnished by each patron during the season's run and the individual ledger showed the payments made to each, and as all figures had to be checked back and forth in the manager's preparedness for kickers, there could be no doubt of the milk each delivered and the cash each received. The numbers of cows each patron had in milking was also recorded, for there were often neighborhood discussions of the facts and the managers armed themselves with defensive figures—which they also needed for offensive purposes, for all the factories, which were not widely distant from each other, tried to argue or shame their patrons into getting more milk from their acreage. There was also much canvassing among factory managers to get for themselves the "good dairies" which had large milk yields and to shunt to their competitors "poor dairies" because such dairies yielded less milk and more kickers. As we look back upon it, it was a very interesting undertaking and the publication of the results, which are outlined on another page, attracted much attention.

HOW INDIVIDUAL COW TESTING BEGAN.

THE figures to which we allude yielded only herd averages, but they disclosed differences which were a surprise to most people. If we remember correctly the pall-performances of so many cows had not been gathered and averaged previous to that time. And these were herd averages, not performances of individual cows, and they were all of herds in common dairy business—not of herds expensively promoted, though evidently some of them must have been expensively neglected. It is interesting to note that at about the same time very significant tests of individual cows were being made. One was by a Herkimer county (N. Y.) dairyman and it was very freely quoted about 40 years ago. This man found by book-keeping experience that the feed of his cows

averaged a cost of \$35 per cow. He found by measuring milk of the cows that the best five of them averaged 554 gallons of milk each and that the worst five of them averaged 243 gallons. The average value of milk during the test season was 11½¢ per gallon and figuring showed that his best cows were averaging a product of \$63.11 and that the poorest averaged \$27.95. In other words he was making \$28.71 clear profit on each of his best cows and he was losing \$7.06 on each of the others. This demonstration is at least forty years old and yet some cow-feeders are slow to get into cow testing associations even now. We do not exactly know when careful cow testing began. It is probably a very old art, but not old enough. If old Noah had had a Babcock test and platform scales in the receiving room of his ark he might have settled the poor cow question for all time!

EARLY COW-TESTING IN CALIFORNIA.

THE publication of such figures as we have cited, in the farm papers of the time, excited interest in California as in all other States. There was then no Babcock test and one could not find out exactly the value of a cow as is now possible. The test was by weighing and measuring the milkings and then monkeying with cream-gauges, miniature-churnings, lactometers, etc. Of course if a man was selling whole milk to a cheese factory, as in the case of the Herkimer dairyman, he did not need to worry how much water the cow was putting off on him—all he had to do was to determine the weight of the milk, such as it was. And that was what most of the testers of that time satisfied themselves with anyway. And even that sometimes upset them a good deal. The common elementary testing was to buy a spring-balance; hook it up in a doorway; tag the cows; tack up a sheet of paper on the back of the door; weigh the two milkings of each cow on the first and fifteenth day of each month; at the end of the year add the weights for each cow and multiply by fifteen. This gave a rough approximation to the weight of milk the cow had given. That was the way the first test made in California, which we remember, was carried out. It was by a dairyman in the lower part of the Napa valley. He knew of the figures we have given above and had concluded that if the best New York cows averaged 554 gallons of milk (or about 4450 lbs.) a year he was certainly not going to keep any worse cows in California, where they had grass all winter, and so he started his record, announcing that any California cow which did not give 4500 lbs. of milk in a year should "go to the chair." We did not see him for several months, but then asked him how his cow record was coming on. He was sad a moment and then said, quietly: "I had to tear the paper down. I figured after a few weeks that I did not have any 4,500-lb. cows and that even if I put the life-limit at 2500 lbs. and killed off at that, I would not have cows enough left to keep my milkers busy. You know a man cannot have a decent-sized dairy without plenty of cows." And so our old friend dropped his cow-testing and, like the merchant who marked all his goods to sell a little below cost, started again in pursuit of the phantom of getting rich through the increased volume of business transacted.

Still it was very clear, even forty years ago, that some of the herds were making their owners rich and some were keeping their owners poor. And it is not very creditable to human progress to be obliged to admit that some herds are doing one thing and some the other, to the present day. Still it is encouraging to note that there is wider interest in cow testing than ever before: that associations for cow testing are rather new and are making great progress, and that a State contest for premiums is to be taken up in California, because all these things awaken still wider interest in knowing whether individual cows are working for their owner or whether he is working for them.

WHAT A COW TEST IS GOOD FOR.

WE ARE enthusiastically in favor of the State cow contest which is soon to begin and made our first move toward securing the operation of it in California, because we have

strong convictions of the awakening power of it and because its results define standards which will shine brightly in the eyes of all those who have to do with dairy cows. These standards will be influential in breeding, feeding and handling operations for all cow people for years to come. They will concretely demonstrate what is practicable and available and therefore to be striven for. The cow contest has a value of its own. Economically it is not comparable in importance with the work of a cow-testing association, which appeals to us as basic and fundamental. It will, however, illuminate the pathway of cow-testing associations, set new standards for them and therefore operate as a new lifting-power in their progress. It strikes at once at the most advanced positions of purposeful breeding and selection, at the highest operation of nutritive functions and materials and at the most vital phases of man's relations to the productiveness of the animals which he employs. We hope no dairyman or woman will go into this cow contest with more idea of beating other men and women, with the work of his cows, than of advancing and improving his own understanding. The contest has in fact a much higher educational than economic or competitive purpose. It is not a matter of simple recipe or formula; it involves understanding and judgment of all recipes and formulas. If, for instance, Jones makes a desperate effort to find out how Smith feeds cows and imitates him he stands a good chance to be beaten by Smith, and perhaps by many others, because his conditions may be different from all of them. This contest ought to compel every contestant to find out exactly what his conditions are and how his animals react to the forcing agencies he will desire to employ to develop highest efficiency in them. This is only to be safely done by understanding the fundamental principles involved and watchfully applying these principles to one's own problems. Therefore in this matter of feeding it is a great deal better to study a careful treatise, in which nutritive principles and practices are clearly connected up, than to hunt for other feeders' methods. For example, it will be vastly more profitable to get a copy of Prof. Woll's "Productive Feeding of Farm Animals" and study it for days in the shade, with note book and pencil than to waste gold or gasoline in lathering around in heat and dust trying to get other people to tell what they are doing. Suggestions of individual practices may be, however, very valuable—to one who can understand the principles involved in them, for he alone is able to judge their applicability to his conditions and adopt or avoid them on that basis. And the same is true of the method of mastery of problems of breeds, of breeding policy, of labor-saving appliances, of keeping records and of everything else which participation in a great cow contest involves. Roughly speaking we are inclined to indulge in the sententious declaration: that the operation of a Cow-testing Association is chiefly for the improvement of cows, and that active and alert participation in a Cow-Contest is for the improvement of cow-owners. We hope that our readers who enter for the coming cow-contest will go in for all there is in it.

Salt and Sulphur for Mice and Horses.

To the Editor: Will salt and sulphur sprinkled on the loft floor in equal proportions under hay, keep out mice? If so, is the sulphur apt to prove injurious to horses to which the hay is fed, or can it be used with impunity? What is the proper proportion of salt per 100 pounds of hay to be used at the baler where hay is being baled?—E. C. H., Independence, Oregon.

It will have no effect on mice. If they do not like it they will climb up in the hay. Sulphur in such amount as they are likely to get will not hurt horses. The way your grandmother filled you up with sulphur and molasses ought to teach you that. But too much salt is not good for horses. Hay should only be salted lightly—say 10 or 12 lbs. to the ton.

Getting Rid of Stumps.

To the Editor: I sawed down two immense eucalyptus trees. Will you or any of the readers tell me how to kill or get rid of the stumps?—C. E. P., Williams.

If there is a stump-puller in your vicinity the operator of it may help you out. Powder will also do it and you can find out all about that by sending to the Giant Powder Co., Kohl Bldg., San Francisco, for their pamphlet on the subject. Other ways take more time. You can keep the stump from sprouting by chopping off the bark, down as far as you have patience to go, and the stump will soon decay, for that is the way with blue gum stumps. Another way takes less time and more work, viz.: grubbing out, and some of our readers think that the most convenient way for quick work with a few stumps. Prescriptions for boring holes and putting in saltpeter, coal oil or other things we have no faith in, so readers will please not repeat those stories.

Nematode Galls Not Bacterial Nodules.

To the Editor: I have 3200 tomato plants which are looking fine except that here and there one turns yellow and withers. On examining the roots I find them quite knotty. Is it a disease or an overdose of bacteria? My soil is a sandy loam; my seed bed was in soil where I raised tomatoes last year.—H., Hemet.

The root you send has galls or swellings made by nematodes, which are too small to see without magnification. The enlargements are not bacterial nodules, which are only found on legumes, and the tomato is not a legume. About the only way to fight nematodes is to run away. If you only have a few plants infested you might use the land a little longer for tomatoes, if desirable. If not plant next year on new land, not recently used for any vegetable—for nematodes take to scores of them. In any event, make your seed bed next year on soil which has been in pasture, summer fallow or grain but not in a vegetable crop.

Erinose of the Walnut.

To the Editor: Kindly tell me what this is on the enclosed English walnut leaf. The tree is 3 years old and the disease is spreading. There is no noticeable effect on the tree. Is it serious? What is the control, etc.?—R. S. T., Los Angeles.

The injury appears as tufted spots on the upper side of the leaf; the under sides of the spots being also raised from the surface but smoother. The under sides of the spots are generally light brown—the upper, generally darker by exposure. The injury is caused by a microscopic mite. Spread of the pest might be checked by spraying with kerosene emulsion as soon as the first sign of the injury appears, or by dry sulphuring. But though the blemish is conspicuous and threatening, it usually does not pervert enough of the leaf surface to affect the thrift of the tree and treatment is usually negligible.

Disease of Swiss Chard.

To the Editor: We have a Swiss chard patch that is troubled with a disease similar in appearance to the fire blight on the pear. We had it two years ago and it ruined our patch in short order. If we can combat this disease we believe that we have found the ideal green feed for chickens, as it can be carried over for at least two seasons. Can you give us a remedy?—C. B., Napa.

The Swiss chard is a beet and the beet has a blight which begins with a small brown spot with purple edges and may proceed until the leaves blacken and die from the tip to the base. If this is what you have, start in with Bordeaux spray as soon as you see the brown spots beginning. But we are not sure you have this blight; you send no specimens and we are not good at absent treatment. We have to see the patient and even then we often do not know what the matter is with him.

No Permanent Grasses on Dry Foothills.

To the Editor: On this foothill land when brush has been removed what grasses make best permanent pasture without irrigation? Also time and

way to seed?—H. M., Amador county.

We know of none. You can get green pasturage during the rainy season, and dry feed after that, by sowing bur clover, wild oats, filaree, etc. Other good annuals will also appear naturally—so that you will get much pasturage if you do not overstock and keep all plants from seeding. But for perennial grasses on dry foothills you need water; not very much for rye grass, orchard grass, red-top, tall oat grass and a few others—but you must use some water to keep them alive through the dry season so that they can grow the rest of the time. Sow all such grasses with the fall rains.

Black Aphis of Citrus Trees.

To the Editor: Am enclosing a small insect that is killing our orange trees. This is the third year. Please tell me how to kill them.—S. P., Parlier.

It is the black aphis, or plant louse, of citrus trees. It is found in all citrus districts, but is usually held in control by its natural enemies. Where it gets the upper hand it can be checked by thorough spraying with soap and tobacco wash. This would probably give the enemies a chance to catch up. Your specimen shows the larvae of the syrphus fly among the lice and dining on them. As for killing the orange trees, lice are not apt to do that unless the trees are made unthrifty by some other adverse condition.

Selling Walnuts.

To the Editor: What would you think of a walnut grower in our valley (where there is no local of the State Ass'n) putting up this year's fancy nuts in 1, 2, or 5 pound cartons and selling to a private trade to be developed? Where can we obtain such cartons?—E. F. S., Concord.

Some individuals are doing it and selling by parcels post, but we have no details of their results. We understand that the Walnut Growers' Association welcomes members at large in places where there are no local associations and we should be inclined to look into such membership, furnishing of cartons, etc., before going it alone. The manager is Carlyle Thorpe, Los Angeles.

Cutting Seed Potatoes.

To the Editor: I note in your reply to R. W. H. Sanger, on what kind of seed potatoes to plant, in your issue of June 17, you advise "small medium" planted whole. This question was tested many years ago in England and it was found that "medium large" cut two eyes to the piece, gave the best returns per 100 lbs. of seed. Many eyes produce many stalks and more than two stalks to a hill generally means small spuds. Also cut off the cluster of small eyes at the bud end.—F. W. C., Watsonville.

Yes, and such tests have been repeated hundreds of times since, both in Europe and this country, and all kinds of conflicting results have been attained so that it now seems to be fairly demonstrated that the only important thing is that the seed piece should have not less than three or four ounces of substance to start strong shoots; that removing the seed end is waste of time and substance; that planting whole potatoes gives more crop than cutting but not enough more with big potatoes to pay for the extra amount of seed required and therefore large potatoes should be halved or quartered, according to size, and that only one piece or one whole potato should be planted in a place.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m. July 18, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	1.16	1.29	.11	62	48
Red Bluff02	1.02	0	96	58

San Francisco	0	.93	.01	84	52
San Jose	0	0	0	92	46
Fresno	0	0	0	100	58
Independence	0	0	0	94	
San Luis Obispo	0	0	.01	74	52
Los Angeles	0	0	0	78	56
San Diego02	.02	0	70	60

Contra Costa Pear Drying.

[Written for Pacific Rural Press.]

Only California and New York produced over a million "bushels" of pears in 1909 according to the census; and their nearest rival is Michigan with a little over half a million. Most of these are canned or shipped green—so much so, that dried pears are not segregated in any statistics we can find of production or export.

However, there are many windfalls which in ordinary years are not sought by canners and cannot be shipped East. Where shipping fruit is worth \$60 per ton, windfalls may be worth \$22, which the canneries are said to be offering for them in Contra Costa. If the canners take them all at that price not many will be dried, for that would make dried fruit cost about \$120 per ton besides the drying. This is more than much of the dried pears sell for.

Probably the most extensive pear dryer in Contra Costa county is E. B. Anderson whose own crop is supplemented by purchase of all his neighbors' windfalls.

According to A. R. Munroe and C. B. Jones, experienced fruit handlers now working for Mr. Anderson, the first operation of proper pear drying is to cushion the earth under all trees with dry manure or straw—the former serving two purposes with the same labor, if obtainable.

Pear picking for shipment East began in Mr. Anderson's orchard last week. Fruit suitable for drying had begun dropping a week or so earlier. If it drops onto hard clods and breaks the skin, such breaks must be cut out before drying. Ordinary bruises with unbroken skin may be slightly discolored but "the sulphur clears that up."

Piled until Ripened.—Pears for drying are gathered before they sunburn, stored in piles a foot or two deep, and covered with straw or hay to keep them cool and dark.

When they have turned yellow and become nearly soft enough to eat, drying commences, perhaps a month after picking commences. Drying season may close Aug. 30 to Oct. 1, according to amount of fruit.

When drying commences, the piled-up pears are picked over, selecting those suitable, and sending them to the women cutters.

Kinks on Cutting.—Each fruit is cut endwise into halves, leaving both the stem and blossom calyx on the same half. This permits the calyx to be cut out and the stem pulled out more quickly than if on separate pieces. The stem pulls out much smoother and quicker than it could be cut out. It is hard to keep the cutters from cutting off the stem end of a pear before halving it. But when allowed to do this they get careless and cut off half the neck. The waste in cutting the stem off at all, amounts to considerable in a ton of pears. If there is any bad place in the pear, the knife runs through its center. Then the bad part can be cut from the edges of the halves without wasting good meat. Cores are left in, unless wormy. At one time the cores were cut out, but there was much waste and no better prices. Mr. Jones used to make high-speed cutting, by

grasping the pear in his left hand so that he could turn it over with his thumb after setting the knife into it and holding the knife comparatively still, with very little waste motion. Eyes are kept on the tray rather than the lug box. About 8c per 50-pound net box is paid for cutting. A good cutter gets about two boxes onto the usual prune tray which is used for pears. Close packing on the trays is desirable.

How Pears are Sulphured.—Sulphur houses are of wood covered tightly with tarred paper. They hold a carload of 20 trays each. A "heavy dose" of four to six quarts sulphur is put in a kettle set about two feet deep in the floor of the sulphur house. If too close to the fruit, the heat of burning sulphur would cook it.

The first dose lasts about six hours; and two of less quantity are burned before the fruit has been in the fumes 18 hours. Pots must not be filled full, for burning sulphur liquefies and would run over.

To start the sulphur burning, a canvas strip is buried lightly in it. This is better than paper, which burns too quickly. Mr. Jones discovered that the strips work better if previously dipped in sulphur liquefied by heat. He has fixed a whole season's supply of such "wicks" at once. They are hung up to dry after dipping, and then stored till used.

If fruit is specially ripe, one big dose of sulphur sometimes does the work. At any rate, the pears should become so soft that the core can be pushed through the meat, with a finger. It will mash if picked up and dropped onto the tray. Juice does not seem to run out as with peaches, but the sides are moist and will discolor if trays are dirty or are made of unseasoned redwood.

Drying.—They are left on the dry ground in the sun, in Contra Costa county, one to three days. When the edge of the skin turns brown and begins to curl in, they are ready to stack, according to Mr. Munroe. If left longer, the brown color would extend into the meat and not come out. The sooner they can be stacked, the better, thinks Mr. Anderson. Some are piled up with inch strips between trays for ventilation, but the better way seems to be to stack them in ricks with trays end to end and resting on each other. The centers would sag with weight of fruit, so a strip must support each center. They are left in the stacks one to three weeks according to weather—the longer the better. When they can be handled without breaking the skin, they may be stored in lug boxes until packing time. They have better color if there is no dew. They dry away 5½ or 6 to one—less when full of sugar as those grown on adobe land. It seldom pays the grower to sort them unless there are too many black spots. Seldom are any but Bartlett's dried.

The St. Helena Vintage Festival will be held Sept. 1 to 4. A dramatic allegory and new scenery will portray the delights of tilling the soil. A floral and industrial parade will be held Monday.

Destroy Pests

with "Corona Dry"

The Universal Insecticide

"Corona Dry" is the most successful pest destroyer on the market. It is now being used by thousands of large fruit and vegetable growers throughout the United States. Costs little and produces wonderful results. No sloppy mixture required—"Corona Dry" is applied in dust form. For corn, dust on silk only—no danger to ear or fodder. Write or call for booklet "Garden Pests and their Control." Ask your dealer for "Corona Dry."

Anderson Combination Dipper, Perforator, Grader and Spreader

Send for new CATALOG of Packers' and Dryers' Machinery.

The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1916 CATALOG.

It illustrates and describes the entire Anderson-Barngrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

Anderson-Barngrover Manufacturing Co., 320 West Julian Street, San Jose, Cal.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from \$12 to \$30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. There is no war tax on land, nor is there any conscription. For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Government Agent, Canadian Bldg., Exhibition Grounds, San Diego, Cal.

Canadian Government Agent.

Reasons for Sour Sap---Stocks for Plums.

[Written for Pacific Rural Press.]

To the Editor: Your summary of the three causes producing "sour sap" (June 24) is most helpful; as it harmonizes the hitherto conflicting and often contradictory theories advanced. Cause number three is rarely, if ever, realized—injury by frost—but when it is remembered that in March, the thermometer rose frequently to 90 degrees, and in May fell below 32 degrees, what wonder is it that the flow of sap was seriously interfered with! These conditions prevail every spring. However, there is not often nearly 60 degrees difference in temperature during the spring. Such variation, together with the two other causes you mention, will readily explain why it is that so many young trees are sour sapped almost every year.

Stocks for Plums.—In the same issue of Rural Press, Farm Adviser E. O. Amundsen of Placer county gives good advice in regard to plum stocks. I introduced both the Diamond and Grand Duke into California from Rivers & Son of England nearly twenty years ago, and since then have imported many other varieties from the same firm. The non-union of Diamond with peach was well-known then; and any good nurseryman could have saved growers lots of trouble if they had asked questions through the Rural Press, instead of making costly experiments. There are comparatively few varieties of domestica plum which unite well with the peach; and it is useless to try to work them together. Those who have peach trees which they desire to change into Diamond plums, or some others, should do so by first grafting onto the peach some variety, like Damson; and then work that over to the plum which will not make a direct union with the peach.

Morganhill. Leonard Coates.

SAVES BREBA FIG CROP.

To the Editor: In your issue of June 3, the item under the above head is misleading. Undoubtedly the pseudocarica is the capri referred to. The mamme crop of capris fertilize the breba crop of Smyrnas. That is why the pseudocarica may become a big factor in Smyrna production. It is the only capri we have, whose mamme crop carries pollen. Now the mamme crop ripens in January in Imperial Valley, so the crop your correspondent saw in May was the profichi crop which pollinizes the main crop of Smyrnas. The breba crop if pollinized would undoubtedly have been ripe in May.

Mr. Markarian of Fresno tried pseudocarica on his breba crop without success. He reports no pollen, possibly due to the young age of the trees. I believe he got the capris from the Clovis district.

Early in 1915, Mr. Heiny sent me some pseudocarica mamme. They contained pollen and blastophaga. They were the last of their crop, but too early for use in this district.

Kerman. Walter C. Ficklin.

[The capris referred to were pseudocarica and their mamme crop had pollinized the Smyrna brebas which were set well when seen in May and about ripe. The article referred to was awkwardly stated in that it seemed to say that the insects emerging in May were the ones that pollinized the Smyrna brebas. Mr. Heiny has produced seven gen-

erations of wasps in a year near Brawley. The first of these was late in February; the last in December. It was the generation which matured when the Smyrna brebas were receptive that pollinized them. We are glad to get Mr. Ficklin's criticism.]

YOUNG PRUNES DEFOLIATED

To the Editor: About 40 of my coming year-old prune trees were totally defoliated by stray goats. Will this kill them (the trees) and is there anything I can do?—C. H., Gilroy.

[If your trees were vigorous, they have enough reserve food material in their trunks and roots to put out new leaves before they starve, provided they have plenty of moisture. Trim off ragged twigs and branches, keep the ground well cultivated, set a board vertically on the southwest side to shade the trunk of each, and irrigate them if the ground is at all dry.]

WOOD RATS IN ORCHARD.

To the Editor: In a recent letter from Ira Avery of Newcastle, he says that last year he experienced considerable trouble from wood rats climbing young pear and plum trees and cutting off the small limbs. He also states that the rats gnawed the base of some of the pear trees quite badly. By setting steel traps at the trees where they were working he got the rats and since then has experienced no injury. He also relates that on large cherry trees he has from time to time noticed spurs and small limbs cut off by the rats.

We have heretofore always laid such work at the door of the ground squirrels and it is very interesting to know that Mr. Avery has trapped these pests at their work. Never having before known of such injury by woodrats, we pass the information along through your columns for the benefit of other orchardists.

Loma Rica Nursery.

Grass Valley.

GRAPE LEAVES CUT OFF AT NIGHT.

To the Editor: When the grapes on my pergola were nearly ripe, something heretofore has bitten a few bunches off through the stem every night. This year I find a few leaves on the ground every morning, bitten off in the same way.—R. H. S., Menlo Park.

[Look them over with a flashlight after dark and if you find cut worms at work, place some poisoned bran around the bases of vines and in crotches or on horizontal parts. Formula adapted from "Second Thousand Questions in Agriculture": Mix an ounce white arsenic with ½ pound dry bran and stir in 1-5 pt. molasses diluted with enough water to squeeze out very slightly between the fingers when a handful of the mash is squeezed in the hand.]

If your raspberry canes have reddish or brownish spots with purplish borders, they have anthracnose and will have it again next year unless they are thoroughly sprayed with Bordeaux just before buds begin growth in spring.

John Deere Implements

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.

Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.
2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.
3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

John Deere Plows for Light Tractors

With High and Level
• Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

Deciduous Fruit Maturity Standards.

[Written for Pacific Rural Press.]

Maturity standards for fruits and certain vegetables shipped East are widely desired as a part of the new standardization law.

There are, however, difficulties here that are not encountered with grapes and oranges. The desirability of maturity standards easy to enforce and fair to all cannot be doubted after seeing their effects on the market for the two fruits mentioned.

Deciduous fruits, being so perishable, must be picked in most cases too green to eat, that they may not be spoiled at the end of the six to twelve day trip East. Certain of the largest Eastern buyers want the fruit so green on arrival that it can be re-shipped to interior local points before breaking down.

A conscientious shipper of Placer county whose efforts for maturity and standardization have made his markets most stable, and have impressed higher ideals on California legislation, recently showed us a daily market report in which the highest priced lots, as a rule, had been shipped much greener than our friend's standard. He also mentioned having shipped a car of peaches f. o. b. some time ago, which he felt were considerably too green. He wired his customer in Minneapolis that if there should be any loss, satisfactory adjustments would be made. The Minneapolis house reported that the fruit was exactly what they wanted, since much of it would be reshipped to the Dakotas in smaller lots. They suggested that the shipper had been losing money by insisting on his standard of greater maturity.

On the other hand, a house in Lincoln, Neb., wrote in 1915 complaining about the immaturity of the first car received that season. They stated that they "would have to wait until the trade had forgotten their experience with it before they could order more." And Manager C. E. Virden of the Cal. Fruit Distributors is constantly pleading for less immature fruit to market. The largest city markets consume a large part of our fruit without reshipment. This should be ripe and eatable on arrival.

Irregular Maturity within each package, probably hurts our deciduous fruit markets more than immaturity; and this, the law will prevent when fully enforced. We have seen many lots of plums, apricots, cherries, and peaches, which sold low because only one or two messy or moldy fruits showed in the sample crate or box, on which the rest of the lot was judged.

What Kind of a Maturity Test?—The difficulty of establishing standards for the reshipping and local-consumption purposes of Eastern buyers, is complicated by two other factors.

How to make a sugar test of fresh fruits picked only partially ripened, when as one inspector said, "it would take a whole boxful to get juice enough for a test," is the subject of a problem on which the University is already working on Bartletts at the suggestion of Acting State Horticultural Commissioner Geo. P. Weldon. Inspectors now sometimes bite into a few to judge their maturity

by relative sweetness to taste. Pears too immature when picked, shrivel instead of ripening.

Most deciduous fruits except cherries and grapes develop sugar after being picked, so if a suitable sugar test can be devised the questions would still have to be answered, "How long will the fruit be on the road and at what temperatures?" "How much sugar develops under given times and temperatures in each kind and variety of fruit after each condition of maturity at the start?" and "Is the fruit to be consumed locally or reshipped?"

Cantaloupes.—The maturity test being practiced this season on cantaloupes was agreed upon by practically all the shipping companies in Imperial Valley. A melon is considered mature if, in picking, the stem pulls entirely off smoothly (full slip); if it leaves part of the stem, it is "half slip" and immature, especially in the early part of the season. Government chemists have been working on a sugar maturity test this season.

But the great difficulty in fixing maturity standards would be to get some that would be fair to all sections.

Color Test Unfair.—A color test

is certainly out of the question on account of its varying relation to maturity in various counties; due to "different climatic and soil conditions and various altitudes."

Color is not a reliable index to eatableness, which is the final vital test. With strawberries in Sacramento county last season Deputy F. C. Brosius noted that "lots of green berries were colored by the north wind while still not eatable—lacked sugar—would shrivel on the vine" or in the package.

With plums, etc., there is irritation between foothill and river and other districts because foothill plums have higher color at the same maturity, but some of the growers do not realize it.

GRAIN FOLLOWED BY CORN THE SAME SEASON.

[Written for Pacific Rural Press.]

Grain followed by Indian corn the same season is the rotation practiced by E. A. Parkford who has leased the Ontario sewer farm for 25 years. Alfred Allen, who was in charge last spring, told how Indian corn was planted in July and August last year. The last 10 acres grew 7 to 8 feet tall before being cut for silage. The earlier planted corn grew a foot or two taller. It had been irrigated just before planting.

Sixty acres of corn filled two 130-ton silos.

After the corn was off, the land was gang-plowed and sowed to grain just before Jan. 1. It was expected to have the grain off in May, irrigate with the sewage water, and plant corn again. The soil is deep and light, underlaid with gravel.

GOOD BYE! Morning Glory

Don't let this troublesome weed sap your soil and ruin your crop.

NONPAREIL

is the one sure exterminator that does the work without injury to the ground. Read what Luther Burbank says: "We find that Nonpareil destroys not only morning glory but also horse-radish. We consider it a thoroughly satisfactory weed exterminator"—Luther Burbank.

One gallon of Nonpareil is sufficient to kill 250 plants. It does not prevent the ground from producing regular crops. It acts as a tonic to the soil. It is easy to apply and economical to use. Write today for interesting folder on this profit saver.

How the Rural Credit Bill Became Law.

WASHINGTON, July 17. — President Wilson today signed the rural credits bill passed recently by Congress. Just before signing the measure, which creates a system of twelve land loan banks under direction of a federal board, the President made a short address.

"I cannot go through the simple ceremony of signing this bill without expressing the feeling that I have in signing it," said the President. "It is a feeling of profound satisfaction and real gratitude that we have completed this piece of legislation, which I hope will be immensely beneficial to the farmers of the country."

"The farmers, it seems to me, have occupied hitherto a singular position of disadvantage. They have not had the same freedom to get credit on their real estate that others have had who were in manufacturing and commercial enterprises, and while they have sustained our life, they did not in the same degree with some others share in the benefits of that life."

"Therefore, this bill, along with the very liberal provisions of the Federal reserve act, puts them upon an equality with all others who have genuine assets and makes the great credit of the country available to them."

"I look forward to the benefits of this bill not with extravagant expectations, but with confident expectation that it will be of very wide-reaching benefit and incidentally, will be of advantage to the investing community. I can imagine no more satisfactory and solid investments than this system will afford those who have money to use."

The President used two pens and gave one of them to Senator Fletcher of Florida, who asked permission to present it to the Southern Commercial Congress.

In addition to the number of members of the House and Senate, the signing was witnessed by David Rubin of California, one of the originators of the bill, and by representatives of the National Grange, the Farmers' Educational and Co-operative Union, the Farmers' National Congress and the National Council of Farmers' Co-operative Association.

NAPA FARMERS ACTIVE.

To the Editor: There were four gatherings of farmers in Napa on July 8: the farm bureau directors, the Napa county poultrymen, the cow-testing association, and the Napa Valley prune men.

Mr. Weinstock addressed the last group and made a very favorable impression. All whom I have talked with since the meetings think that Mr. Weinstock will accomplish what he is after.

After the meetings the front page of the Rural Press of July 8 came in for an inning. All over town could be seen groups of farmers discussing our all-star school. What the farm adviser and farm bureaus have done for Napa county is nothing short of a miracle. All county seats are largely made up of dyed-in-the-wool conservatives. It is less than two years since the movement was started. It was advertised in the local papers that Professor Baade, our farm adviser, would be at the Chamber of Commerce on a certain date at a certain hour to meet the farmers. Just one lone farmer showed up to give him a welcome.

That's ancient history now; the farmers have made amends for their slackness. They are doing better all-around farming today.

The counties that are without a farm adviser are making a great mistake.

I wish also to say that J. J. Fox, our horticultural commissioner, has been of great assistance to Mr. Baade in making the farm bureau a success. They use the same office and whenever Mr. Baade has been absent from the office Mr. Fox has done everything that he could to help the cause along. Chas Blom. Napa.

3 Big Bull Tractors employed on Moulton Irrigated Lands Co. ranch near Colusa.

Before Buying Your Tractor

1. Compare the simple and strong construction AND PLOWING CAPACITY of the BIG BULL TRACTOR selling for \$645.00 f. o. b. Minneapolis—with any tractor on the market selling for \$500 and \$700 more.
2. Get in touch with BIG BULL owners—they will tell you.
3. Bear in mind the fact that in plowing the BIG BULL steers itself.
4. Consider carefully the testimony of hundreds of BULL TRACTOR owners which proves the bottom of the furrow is broken up by the subsolling action of lugs on the Bull Wheel—they have increased their crops from 10% to 15%.
5. Investigate the remarkably simple and accessible motor of the Big Bull, which delivers a full 20 H. P. for belt work—direct and does not go through any gearing.
6. Compare prices of Big Bull Tractor repair parts with any on the market. The result will surprise you.
7. Notice that the Big Bull has fewer parts. Inspect their strength, quality and accessibility.

THEN SEND IN YOUR ORDER FOR A BIG BULL EARLY ENOUGH TO SECURE DELIVERY!
Tractors are cheaper to work than horses—it doesn't matter which make you get, you will save money.—only with a BIG BULL you save more!!

Mechanical Power on the Farm.

STATE FAIR TRACTOR DEMONSTRATION.

Parade of all tractors in front of grandstand 9:30 a. m. Sept 4. Public demonstration 10 a. m. to 1 p. m. Sept. 4. Private demonstrations daily 3 to 5 p. m.

No exhibitor will be allowed more than one tractor of each size on the field at one time during the public demonstration, which will be confined to plowing. Disking and seeding may be shown in private demonstrations. Each manufacturer will be confined to two tractors during the public demonstration.

The land available for the tractor demonstration will be divided up

among the various exhibitors, space being allotted to each tractor on the basis of the number of 14-inch plows it will pull during the demonstration.

The sum of \$25.00 shall be posted with the Secretary of the State Agricultural Society Aug. 25 for each tractor entered in the demonstration. This money will be forfeited to the Association in case the entry made fails to take part in the demonstration. The money to be refunded at the close of the Fair if no forfeits are made.

All plowing must be to a depth of six inches during the entire demonstration.

In the public demonstration, the motor or tractor must not be run at more than ten per cent above its catalog speed. Tractors may be run on high gear with normal engine speed when disking, harrowing, seeding, etc., in private demonstration.

Positions on the field will be drawn by lot at a meeting to be held on the field Saturday, September 2nd.

No decisions or awards will be made during the demonstration. This is purely an educational demonstration, not a contest.

Each tractor shall bear a placard showing the brake horse power of the engine, the revolutions per minute, the plowing speed in miles per hour, and the kind of fuel used.

All tractors on the demonstration field belonging to one exhibitor must be kept on or along the land allotted him for that day's demonstration, until the hour designated by the management for returning to headquarters.

No machine will be allowed to operate with special equipment other than that designated for practical use with same. No spectacular methods will be permitted on the part of salesmen, or others, to attract crowds.

Each tractor exhibitor may burn any kind of fuel he desires, but no one will be allowed to burn fuel of higher gravity test than that used by his competitor burning the same kind of fuel.

Each company exhibiting at this demonstration shall appoint one manager, who will be accountable for the work of his company and will receive all instructions and make all requests or complaints.

The interpretation and enforcing of these rules shall be left to the director in charge.

Entries to this demonstration to close with the Secretary of the State Agricultural Society, August 25.

JUST A LITTLE ENGINE.

(Written for Pacific Rural Press.)

There is nothing unique about the little 2 h.p. gas engine used by C. W. Troyer of Concord, but why don't more people have them, and why isn't it hooked to the washing machine, poultry feed grinder, etc., as well as to the grindstone and the pump?

The engine is on a concrete foundation. A belt runs into the house where it works a pair of vertical arms by which the pump plunger is raised and lowered. A tank seven feet deep, high up, may be filled in three hours; and it furnishes very

Just as surely as the roof tops the house, does the question of what roofing to buy top all others when it comes to how best to protect property against wind and weather.

Wood-Crane Prepared Roofing

is so far and away above all others that it is in a class by itself. It is a roofing that you can put on your home, on your church, on the town hall. It will ornament the building and vie with the foundation stones in wearing qualities. It never fails to make good. Anyone who can use a hammer can lay it. Every roll is 36 in. wide and guaranteed to cover 100 sq. feet.

PRICES
\$1.35 to \$2.55 per Roll
Nails and Cement Free

Send for Free Samples. Test them for weight, strength, flexibility, fire resistance, and compare them with any roofing costing from \$1.00 to \$3.00 per roll. We are the largest distributors of America's Best Goods on the Pacific Coast. We can save you money and guarantee to give you satisfaction. BLASTING Saved this Orchard

"The use of Farm Powders in the orchard industry is rapidly being learned and appreciated," writes E. H. Shepard, editor of *Better Fruit*. "The worst looking orchard I ever saw, suffering from lack of drainage, was blasted two or three years ago and now looks as fine as any well-kept orchard in the Hood River Valley." By blasting the soil of your orchard with either of the

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

you can insure better drainage, save fertilizer, and keep your trees in heavy bearing. By planting in blasted holes you can make your new trees grow faster, bear earlier, and yield better, bigger crops.

Using just any dynamite for soil blasting is like taking medicine in the dark. Get Eureka Stumping Powder, one of the Giant Farm Powders. It has a slow, disruptive, heaving, far-reaching effect, entirely different from the quick, shattering, cutting, localized action of most powders and dynamites. Its use in your soil will prove profitable, because it does the work right.

Five Books FREE

Now—before you lay this down—write us to send you our book, "Better Orchard Tillage." It contains information that is worth many dollars to you. Other books—on Stump Blasting, Boulder Blasting, Ditch Blasting and Subsoil Blasting for farm crops—also free on request. Mark and mail the coupon.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

desirable fire protection as well as water distribution to the house and poultry yards.

The grindstone has been fitted with a big wooden pulley wheel, on its axle and inside the frame. A belt from this to the engine saves many backaches and takes the place of the small boy who is sometimes unavailable when rush work is to be done.

TRACTOR RUNS SILAGE CUTTER.

[Written for Pacific Rural Press.]
The Hollister Estate of Lompoc recently bought a No. 15 Acme silage cutter and alfalfa chopper. They expect to use it on their next cutting of alfalfa, according to the De Laval Co., though storage room must yet be built. The same is true of the silage and silos. A tractor engine is to be used to run the cutter, which is mounted complete with blower, on a truck. It is designed to chop 1800 pounds alfalfa meal or 10 tons green corn per hour with 7 to 10 h.p. The engine may be placed on either side and in front or behind the machine, to provide a chance to place it in the most convenient position.

To avoid damage if hard substances should get into the knives, a soft bar keys both the fly wheel and the belt wheel to their shaft. If the knives stop, the bar is sheared, and the wheels whirl on harmlessly until stopped.

FALL APRICOT IRRIGATION.

[Written for Pacific Rural Press.]
Irrigation and pruning of apricots right after the fruit is off are greatly favored by G. H. Waters, characterized as the fruit man around Pomona, Los Angeles county. One of his orchards, near Ontario, contains 37½ acres of 14-year Royal trees besides 7½ of peaches. He irrigated twice last fall, the first time in furrows, the second by flooding. He pruned in Sept. having to change around to keep out of the water. This is held responsible for the best crop prospects last spring, of any in his neighborhood. The orchard had a fine crop in 1915 also.

The soil is light and sandy for 12 feet down, below which is gravel. He has a well 356 feet deep from which the water is lifted 100 feet with a Layne & Bowler pump developing 125 inches, being run by a 50 h.p. motor.

GOOD MACHINES POORLY KEPT.

[Written for Pacific Rural Press.]
A capital example of shiftless care of expensive machinery was seen in San Bernardino county last spring. A 60 h.p. General Electric motor was set on a concrete pedestal in the horsebarn without partitions or cover. Hens roosted on it and the interior of the frame was correspondingly filthy. The barn had no floor and was not cleaned regularly. Dusty, dirty So. Cal. Edison Co. transformers, switchboards, and electric meters were partitioned off with chicken wire.

At the other end of the little shack was a big Layne & Bowler centrifugal pump whose base was buried in manure and straw. It had an 8-inch outlet pipe to a Western Pipe & Steel tank outside, set on a tower 10 feet high. Direct connection with the fields was secured at pleasure by running the water into a 30-inch concrete standpipe 8 feet high, instead of into the tank.

1 or 2 Row Beet Plow

**KILLEFER
QUALITY**

**KILLEFER
EFFICIENCY**

Was designed for the smaller grower where traction power was not available for handling the larger plows. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

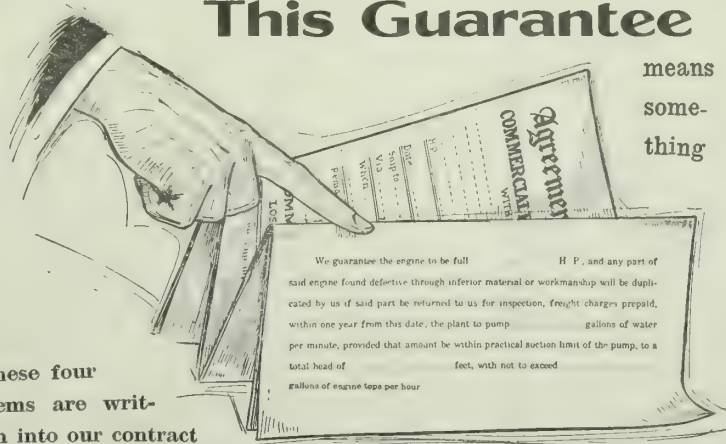

We build this plow with either straight, sloping, or bent standards and with any style of wing or point required.

GRAINS AND FIELD CROPS.

Lake county Agr. Club boys are raising fine corn.

Lovelock, Nevada, hay ranchers need more men for the season.

Many Alpaugh beet fields have yielded 18 to 20 tons per acre this season.

A Tulare county farmer raised 13,000 sacks of wheat this season at 9 sacks per acre.

West side San Joaquin barley growers are said to have sold practically all their crop.

Turlock watermelons opened at \$12 per ton. Standard crates cantaloupes \$1.50 to \$2 per crate.

About 40,000 tons of new barley are said to have been shipped east by rail previous to July 14.

The Turlock Merchants and Growers' Ass'n sold a lot of cantaloupes in San Francisco at \$2.25.

Beet sugar in U. S. is estimated at 2,000,000,000 pounds this year as against 5,000,000 pounds in 1890.

Two British ships have been loading barley at San Francisco for Great Britain. Others will follow.

Imperial Valley barley was short and the Valley is buying from San Francisco through Los Angeles.

Chino beet growers get their 50 cents bonus per ton for 15 per cent beets, on delivery instead of next year.

A splendid yield of blackeye beans is promised in Stanislaus county. A large acreage has been contracted at 4 cents.

Barley sales at \$1.50 to \$1.52 1/2 f. o. b. Port Costa are reported from Tracy and \$1.41 1/4 f. o. b. bank at Grayson.

A Humboldt county cauliflower grower wants to know why the county does not produce all the vegetables they eat.

Two of the biggest San Francisco barley buyers are reported to have recently gotten busy after holding off all season.

The good Santa Ynez hay and grain crop is being used within the county this year instead of selling outside as usual.

The third crop of Stanislaus alfalfa is all cut and the last irrigation for the season being applied. It is selling at \$9 in the field.

Oakdale Alfalfa and Almond Festival Sept. 22 and 23. All growers urged to exhibit their best of all agricultural and livestock products.

The American Beet Sugar Co. has leased 10,000 acres in Kern county on which they hope to colonize Belgians and build a factory.

Livermore valley hay is over half sold. Prices are \$13 to \$15 for wheat hay and \$11 to \$12 for barley and volunteer.

Imperial Valley cotton crop is estimated at \$7,000,000 from 100,000 acres, an increase of 20 per cent in acreage and 42 per cent in yield per acre over last year.

Harvesting cantaloupes and melons has started in the Turlock district. A good crop is on the vines and a good profit expected by the Turlock Merchants and Growers' Ass'n.

Heavy rains have prevented many Michigan and New York bean growers from planting. Cal. is estimated to produce about 1/4 of the beans of U. S., Mich. one-half, and N. Y. 1/4. It is estimated that 10,000,000 bushels are produced per year in U. S.

Arakelian Bros., who "did not know" that the cantaloupe and grape standardization law applied to them, have 1940 acres of cantaloupes near Calexico and Heber, from which they have shipped about 975 carloads. They have taken temperatures on carloads of cantaloupes going East, in order to find the conditions of fruit and temperature en route so they can recommend improvements in refrigeration and de-

termine proper maturity at which to pick.

CITRUS, NUTS, SEMI-TROPICAL.

The second annual Esparto Almond Festival is to be held this fall.

There are about 2000 carloads of lemons still to be sold this season.

Esparto almond growers sold Nonpareils Jul. 13 at 17 1/2 cents, IXLs 15 cents, and Drakes 13 cents.

The unusually large size of navels this year required a special advertising campaign by the Exchange.

An inquiry for 10,000 gallons olive

oil came to the Cal. Associated Olive Growers a few days ago from a New York firm.

Average navel prices have been 35 cents per box higher this year than either of the past two years, according to Ass't Mgr. E. G. Dezell of the Exchange.

Stanislaus fig crop will be heavy and is being contracted at 7 7-8 cents. B. W. Acock, who has 10 acres of Smyrnas, expects to average two tons per acre from his 14-year trees.

Oroville olive growers at an enthusiastic meeting Jul. 13 were addressed by Col. Weinstock who advocated State inspection and a State

label to give confidence to the market and make financial loans easy.

Citrus shipments this season have not been quite as large as last year, but the price has been uniformly better so that the crop will return \$34,000,000 to growers this year as against \$32,000,000 last year according to the Anaheim Gazette.

The California Associated Olive Growers, a reorganization of the recently gasping Cal. Ripe Olive Ass'n, took \$40,000 subscription to capital stock on the Associated Raisin Co. plan during the first ten days of July according to T. E. Foster.

A meeting of olive growers, packers, etc., July 10, agreed that Mis-

MID-YEAR MODEL
73 New Ideas

Mitchell
SIX

\$1325 f.o.b. Racine
26 Extra Features

He Spent \$5,000,000 To Create This Model Factory and to Perfect This Car

What we offer you here—in this Mid-Year Mitchell—is John W. Bate's finality. He says that his work is done.

John W. Bate is the greatest efficiency engineer in America in machinery-making lines. He has been for 30 years.

Years ago we brought him to this plant. We gave him free rein, and paid him his price. We gave him all the time he wanted. Since then he has applied his genius in efficiency to this factory and this car.

Cut Our Costs 50%

He has spent on this plant and its ideal equipment nearly \$5,000,000. He designed every building, selected every machine.

He has made 10,000 factory savings. He has cut our costs 50 per cent. No other factory in the world could build this Mitchell at anywhere near our cost.

He has also built car after car, perfecting each separate part. This Mid-Year Mitchell is his 17th model.

He has studied simplicity, studied lightness and strength. He has displaced hundreds of castings with light, tough steel. There are 440 parts in this Mid-Year Mitchell which are either drop forged or steel stamped.

He has used a wealth of Chrome-Vanadium steel. He has figured big margins of safety. The result is almost a lifetime car.

One Mitchell has run 218,732 miles. Six Mitchells have averaged 164,372 miles each—over 30 years of ordinary service.

Experts Select It

Famous engineers, when they buy cars for themselves, are choosing the Mitchell now.

Your Mitchell dealer has a list of them—men of nation-wide fame. They are men who know cars as you know soils. All bought for their own use this Mitchell car, built by John W. Bate.

73 Things You Want

This Mid-Year Mitchell brings out 73 new conceptions. At the New York Show our experts and designers examined 257 of the latest models. And all the best new ideas—all that people liked best—are combined in this single car. You never saw a car so handsome, so up-to-date and complete.

In addition, this car gives you 26 costly extras. Each is something that you want, but in other cars they cost an extra price.

One is a power tire pump, one reversible headlights, one a costly carburetor, one a cane control. One is cantilever springs, of which not one has ever broken. There are 26 such extras in this Mid-Year Mitchell, all paid for by our factory savings.

New York's Favorite

When this Mid-Year Mitchell arrived in New York it became the fine car sensation. Our New York dealer at once ordered 2000 to supply the metropolitan demand. Ever since his demand for this car has been greater than he could supply.

This car will surprise you. You have seen nothing like it in beauty and luxury. You have never seen a car built like this, and never a car so complete. You have never seen a car so easy to drive, so trouble-proof, so durable. And never such value for the price.

If you don't know your Mitchell dealer ask us for his name.

MITCHELL-LEWIS
MOTOR CO.
RACINE, WIS., U. S. A.

sions and Manzanillos for ripe olives should not be picked until part of the surface is red or darker, that for the season Oct. 15, 1916, to Mar. 15, ripe olives ready to ship should have 15 per cent oil, not more than 120 per pound, must be palatable, sanitary and of good texture in the judgment of a State Inspector, and uniform coloring by exposure to air is not harmful.

GRAPES AND SMALL FRUITS.

Humboldt farmers are thinking of planting more dewberries.

The big wine plant at Guasti was completely burned July 4, with wine valued at half a million dollars.

Keystone and Brawley Thompsons and Malagas will total 55 carloads as estimated by the Brawley Fruit Exchange.

The Fresno county grape grower who last season thought himself independent of the standardization law and appealed his case when fined by a jury in a lower court, was convicted again in the superior court, and the appellate court refused to consider further trial.

DECIDUOUS FRUITS.

The Porterville cannery started July 12.

Two cars of canning peaches were shipped from Atwater Jul. 13.

Over 5,000 tons of dried peaches have been shipped from Cal. since Jan. 1.

Eastern peach shipments from Tulare and Fresno counties started this year.

Madera county growers say there will be more fruit planted there next year than this.

The Cal. Canneries plant at Yuba City started with about 300 employees last week.

The Healdsburg section expects to put out 12 to 15 cars of Gravensteins this season.

Ventura apricots for canning were all shipped before Jul. 7; and drying was finished last week.

The U. S. apple crop is about 5 per cent shorter than last year according to U. S. Dept. Agr.

Coast markets have been taking most of the Gravensteins, but Eastern shipments are commencing.

Armona, Kings county, reports having shipped a carload a day of Early Crawfords to Los Angeles.

Fresno keeps a municipal employment bureau which sent about 1000 fruit workers to jobs last season.

Visalia Tuscans are reported a better crop than for several years, and have been sold at a better price.

At the Campbell, Santa Clara county, canneries, apricots are all packed and peaches and pears are coming in.

The Kingsburg cannery, which opened on Fosters and Tuscans last week, reports short tonnage available.

The Beaumont Fruit Growers' Ass'n shipped its first carload of apples July 6. They were Summer Champions and went to Tucson, Ariz.

Fruit pickers and other workers may enroll for jobs free of cost at the State Employment Offices in Sacramento, San Francisco, Los Angeles, and Oakland.

Vacaville carload fruit shipments for the week ending July 12, 1916, were 122 and for the season to that date 723. Corresponding figures for 1915 are 57 and 385.

The National Apple Growers' Ass'n was recently organized in St. Louis to promote consumption of apples. The Santa Clara Growers' Information Bureau sees here a strong competitor for prunes and all the more reason for organization.

An acreage voting scheme for co-operative associations, which reduces the proportional voting power per acre of the larger growers, so that there would be less possibility for them to control the organization, is proposed by S. H. Shelley of San Jose.

The California Fruit Exchange has not refused to join the proposed State Market Distributing Bureau. Most of the other shippers agreed to it and the Exchange directors simply put it up to their manager, J. L. Nagle, to decide after further investigation. The Exchange has been widely misquoted as having refused.

William Glass of the Fresno Republican, who has for the past year given so liberally of his time and auto facilities for the organization of the peach growers, was elected president of the association; but now that it is well on its feet, he has resigned to spend his time at his own work.

Fifteen counties were represented at a horticultural commissioners meeting in Fresno July 15. They recommend that the standardization law be made uniform and State-wide, favor Market Director Weinstock as the enforcer of the law, and praise his activities. They also discussed county horticultural quarantine ordinances with a view to uniformity, according to horticultural commissioner O. E. Bremner of Sonoma county.

MISCELLANEOUS.

The Solano Farm Bureau is trying to get the county supervisors to clean thistles from the roads.

The Byron Times is out with its

Fifth Booster Edition and it reflects great credit on its editor, Harry Hammond. Besides being a booster edition for San Joaquin and Contra Costa counties, it contains valuable information about dairying, farming and fruit raising in these counties and the Delta region, is beautifully illustrated and written by men prominent in the agricultural field.

Farm products shipped from Byron during the past year were 7000 tons hay, 2500 tons barley, 500 tons wheat, 30 tons alfalfa seed, 5 cars horses, 50 cars lambs, and 5 cars cows.

"California Garden Flowers."—\$1.50 Postpaid . . . Pacific Rural Press

ON even the best of farms there are uncultivated "bald patches" caused by old stumps, rocks, or a bit of swampy ground. There may be some on yours.

Under the methods formerly employed the expense of clearing such a patch seemed more than the land was worth. But every foot of unproductive land is costly to you—is worth clearing if the clearing can be done cheaply enough. It can be by means of

HERCULES DYNAMITE

There is no comparison between the cost of removing stumps and rocks, or running drainage ditches, by hand and horse power and doing the same work with Hercules Dynamite. The dynamite wins every time. It makes it possible for you to cultivate land that you have never counted on before.

Suppose you have a stump to remove. Instead of pulling and tugging at it for an hour or two, perhaps half a day, and then only getting part of it, you bore a hole under it in a few minutes, insert the dynamite—and the stump is fire wood ready for your stove.

If you have never used Hercules Dynamite you owe it to yourself and your farm to write for our book, "Progressive Cultivation". It is sent free upon request. It tells of the many uses for dynamite on the farm—land clearing, tree planting, subsoiling, irrigation work, etc.

Write today for your copy of "Progressive Cultivation". Use the coupon below.

What Dairy Herds Did 40 Years Ago.

Now that interest in cow-testing in California is to be stimulated by a State-wide contest to show producing superiority, under the direction of the University, in which we hope many of our readers will take part, the following outline of a report on herd averages seems pertinent. It is from the Report of the U. S. Department of Agriculture for 1876, page 422:

The eleventh annual convention of the Ohio Dairymen's Association was held in Cleveland, Ohio, in January 1875, and was well attended by representatives of the dairy interests in this and other states. Edward J. Wickson, of Utica, N. Y., in an address on the future of dairying, said:

"I have authentic reports from ninety cheese-factories and creameries, located in widely different localities, giving the average net return per cow to patrons, the highest average per cow to a single patron, and the lowest average per cow to a single patron. The figures are drawn from the actual records of the yields of more than 36,000 cows. In these factories, during the season of 1874, the average yield per cow was \$39.57. In the individual factories the highest average per cow reported was \$55.07, and the lowest per cow in a factory running the same number of days was \$31.22. Taking all the cows into the account, it appears that the average return per cow for the season of average length was \$39.57. It will be remembered that these figures are factory averages, not average yields in single herds.

"It appears from comparing the reports of these ninety factories that the average return net to patrons per 100 pounds of milk has been \$1.22. The highest net yield is \$1.38, and the lowest 99 cents. I have been much interested in comparing the average returns per cow with the

average selling-price of the factory, and the pounds of milk required to make a pound of cheese, in order to determine how much of the large yield per cow was due to the dairyman and how much to the cheesemaker and salesman. In the factory reporting the highest average per cow (\$55.07) the selling-price of the season averaged 14.11 cents, and the milk taken was 9.76 pounds to a pound of cheese. Comparing this with the lowest average per cow (\$31.22), I find that the latter sold cheese for one-quarter of a cent less per pound through the season, and used nearly one-half a pound more milk to a pound of cheese on an average. But this difference in manufacture and price can form only a small part of the difference between the low mark at \$31 and the high mark at \$55.

"The main points in the profitability of dairies are vested in the farm, not in the factory, as the following figures show. Of the dairies sending milk to the sixty factories, the best season's average per cow is \$82.17, and the average of all the highest dairies reported by the factories is \$50.04. The lowest yield in a single dairy carrying to the factory during a long season is \$14.50 average money to a cow and the average of all the poor dairies reported is \$29.34 per cow. Now, the question arises, and it is of the utmost importance to the man who is working for the profits of the dairy, whence comes this great difference in the returns from the dairy-herds? Is it in the soil, the pasture, the cow, the feed, and care in the factory, and how much influence does the final resort, the market, exert upon the dairyman's receipts? I believe that all of these things are factors of the result, and that every one of them should be scrutinized to see whether there cannot be some element of improvement introduced."

Orchard Man Keeps Sheep.

[Written for Pacific Rural Press by John J. Fox, Napa.]

Interest in the small flock is increasing all over the State not alone because of the value of sheep for their mutton and wool but because they must become a great factor in the upkeep of farm and orchard.

Now that the large ranges are disappearing and small ranches taking their place, the cost of raising meat has gone up and better quality in both meat and wool is demanded. That this demand will be satisfied is shown by the scientific interest evinced by the new growers. Once a man becomes interested in sheep, he finds there is a lot to learn in the matter of their selection, breeding, feeding, and management. No live stock pays so well for the cost of care expended.

In September, 1913, E. C. Spear of St. Helena bought the well-known Hood band of 500 Merino ewes. Mr. Hood of Mendocino county had been buying the best bucks he could get and culling his ewes for 20 years always with a heavy fleece in view.

Mr. Spear is a prune grower at St. Helena and also has a piece of rich bottom land that is well farmed.

Alfalfa, beans, corn, and roots are grown every year. He keeps his choicest sheep on the home place, the balance of the flock being kept on rented pasture.

Mr. Spear says, "In culling my ewes at shearing time every ewe's teeth are examined and her fleece weighed. Then she is judged for size, type, and vigor. If she falls below my standard she is branded with the cull mark and drafted out of the flock. I draft in the pick of my two-teeth ewes every year.

Type Aimed For.—The "C" type is the most desirable though it is considered good practice to use occasionally a light "B" type heavy shearing ram to increase the weight of the fleece.

"I am a strong believer in good sires. Have had three shear as high as 30 pounds each. Last fall I purchased a yearling ram from I. W. Jackson of Washington that was a winner in the "C" class at the P. P. I. E., sired by the Grand Champion. This yearling sheared 36 pounds, the fleece having been left long for the Exposition. I expect to use him on

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

A Jersey Opportunity

Having disposed of my farm, will sell one-half of my herd of 30 Jersey cows and 20 heifers, 10 bull calves, and 2 bulls. Most of the cows are in the Register of Merit class and ten will make 500 pounds or better.

Here is an opportunity to buy richly bred Registered Jersey cows with good records, and daughters of high record cows.

If you want good stock at reasonable prices, come and see this stock.

Willowood Jersey Farm

C. G. McFarland, Prop.

Tulare, Cal.

large smooth "C" type ewes that have this year sheared not less than 13 pounds each.

"I also purchased a 2-teeth ewe, also a winner in "C" type at the P. P. I. E. that sheared 24 pounds.

"I keep 25 ewes and their lambs here on my home place; and don't feel the cost of keep, as they get most of their living on what would otherwise go to waste. Last winter they did well on bean straw fed to them in the barn, also going out in the prune orchard when it was dry enough. From the 25 ewes I raised 30 lambs. One ewe that sheared 13 pounds of wool raised twin lambs; and one of these twins at 4 months old, went to the butcher weighing 100 lbs. at 8 cents a lb. The other lamb will weigh 60 lbs. So far the butcher has had all the ram lambs.

HORSE OWNERS! USE

CAUSTIC BALSAM.

A safe, speedy and positive cure. The safest, **Best BLISTER** ever used. Removes all bunions from Horses. Impossible to produce scar or blemish. Send for descriptive circulars.

THE LAWRENCE-WILLIAMS CO., Cleveland, O.

"My range sheep average 10 pounds to the fleece, sold at 27½¢ a pound f. o. b.

"My main flock of ewes runs from 2 to 4 years old. I have two unrelated Hood bucks, 4 yearling bucks purchased of F. Meacham, and two one-year bucks purchased of E. Bulard, besides the Jackson buck."

Where live stock is needed to keep up fertility of orchard, and to eat waste apples and weeds round the fences, the sheep, even in small numbers, is coming to stay.

Milk 27 Cents Per Hundred for Hogs.

[Written for Pacific Rural Press.]

One of the few dairymen in Humboldt county who find it more profitable to feed their skim milk to hogs than to sell it to the creamery for casein manufacture at 27 cents a hundred is Nate Hauck of Alton.

Mr. Hauck has been a breeder of purebred hogs for a great many years, until just recently being compelled to sell his surplus locally and to the mountain trade.

Originally he raised Berkshires, but in 1905 he changed to medium type Poland-Chinas because his mountain trade requires a hog that does not become wild on the ranges, and the Poland-China filled this requirement better than the Berkshire.

In 1910 the change from medium type to large type Polands was started, the larger boned and framed hog being more popular with the mountain buyers. And it is from some of the best large type boars that have been brought to the State from Middle Western breeders that Mr. Hauck's present herd is the offspring.

In developing his hogs to the desirable size at an early age Mr. Hauck has special feed and climatic advantages, the weather being cool at all times, and a wide variety of

feeds being available most of the time.

Alfalfa, clover, rye grass, oats, and vetch comprise the different pasture crops, supplemented in the fall and winter with carrots and beets. As a further supplement, all of the skim milk from the 16 cow dairy is fed in connection with ground barley and other concentrates in the combination farrowing and fattening house.

This house has a central feeding alley, with five large farrowing pens on both sides and a commodious feed storage and mixing room at one end. It is well ventilated and lighted with windows on the south side and equipped with a concrete floor that drains to gutters along the feed alley.

Each farrowing pen is equipped with a movable platform or floor, large enough to provide the sow and her litter sleeping quarters, off from the cold concrete. These are placed in one corner of the pens, guard rails being provided. Division panels are movable, upward and downward, by having them run in grooves at the ends. This sliding division panel is unusually convenient in transforming the pens into larger fattening pens when conditions warrant it. Except during farrowing seasons, the enlarged pens are used in feeding the young stock.

Adjoining the building on either sides are open-air pens, which in turn are connected by gate with the pastures. In some pens where young stock is being fed, self-feeders are provided.

Ten sows are usually reserved, but more are being kept now, owing to the enlarged market available, since rail connection has made outlet to other parts of the State possible.

That Mr. Hauck not only gets good returns from his skim milk, but from all other feeds, is indicated by the weights he secures. One pig farrowed March 5, taken at random from 40 or 50 others of the same age and weighed at the time of the writer's visit, June 16, weighed 120 pounds. A nine-months sow which Mr. Hauck expects to exhibit at the fall fairs tipped the scales at 355 pounds.

But feed and cool climate are not alone responsible for such gains. Breeding is also a factor, and while this herd has been rather isolated from the rest of the State, Mr. Hauck has been a crank on good boars, having used such boars as Iowa Wonder, by A Wonder, Longfellow 3rd, and Long Model. The last named is capable of making 1,000 pounds or better when fat and is still in use in the herd. During the past winter Cantrall's Ideal, a son of Big Joe, has been purchased. As a yearling, this boar weighs 500 pounds and is a model of refinement. He will be used as herd sire in the future.

Taken as a whole Mr. Hauck's disadvantages in the way of distance from the large hog-raising districts and his high-priced milk, seem to be more than overcome by cool climate, variety of feed, and choice breeding.

W. S. Corsa of Illinois recently bought a daughter of the Berkshire Laurel Champion from Winona Ranch, Grants Pass, Ore.

Son of Segis Pontiac De Kol Burke READY FOR SERVICE.

We are offering at a very low figure a splendid son of this coming young sire. Born March 6, 1915.

His record dam has the following records:

Butter 7 days 26.41 Milk 605.5
Butter 1 year 755.40. Milk 20260.2
She is a daughter of Ignaro De Kol, ten of whose daughters have records above 20,000 pounds milk, including Aralla De Kol 28,090. Three nearest dams of this bull average 26.68 lbs. butter, 668.8 lbs. milk. Dam and sire's dam average 920.27 and 24,543 lbs. milk in yearly test. A full sister to his dam has produced 885 lbs. butter in one year.

Price and pedigree on request.

With the Livestock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

SWINE BREEDERS AND STOCK.

A. M. Smith of Visalia has received four bred sows from Winona Ranch.

Geo. Barton, Clements, recently bought a Poland China boar from W. A. Young.

A. B. Humphrey has bought a young daughter of Laurel Champion from Winona Ranch.

H. P. Thornton of San Francisco recently bought 50 acres near Alpaugh for an alfalfa-hog ranch.

Donald H. Graham of Lancaster recently bought 10 registered Duroc bred gilts from Peters, Lamson, and Walker of Devore.

About 250 hogs died from cholera in Antelope valley from April to July 12, at which time the disease had about subsided.

Carl Ginn's dairy and hog ranch at Corcoran was recently found healthy and sanitary by the Kings county livestock inspector.

W. H. Dement of Acampo is just beginning purebred Poland Chinas, having secured a boar pig and four sows from W. A. Young of Lodi.

Three carloads of purebred Tamworths were received July 12 for the Bob Blankenship ranch near Heber from J. W. Sefton Jr. of San Diego.

W. A. Young of Lodi writes that he sold 17 young Poland Chinas in the two weeks ending July 12. A boar and ten bred gilts went to B. G. Cline and M. C. Bolts of Willows.

Frank Brown of Burbank has a litter of seven "perfect" Hampshire pigs out of Bonsell Queen and sired by Paloverde Pinto, a first prize winner at Nevada and Arizona State Fairs.

R. L. Robinson of Fair Oaks reports delivery of four registered Chester White gilts to the following parties last week: Geo. B. Henery, W. W. Hinsey and Mr. Dufour, all of Fair Oaks.

Duroc breeders missed a great chance to get fine stock cheap at the consignment auction held at French Camp July 15. The highest price, \$70, was paid for Girlie of Mossdale by Henry Eckles of Woodland. About 60 hogs were sold. Prof. J. I. Thompson, D. O. Lively, and Dr. B. J. Cady gave short addresses.

J. W. Henderson of Berkeley shipped a Hampshire boar to Frank Brown of Burbank. The boar got lame and almost blind on the way. When Mr. Brown complained, Mr. Henderson wired him, "Knock him in the head. Am shipping you another." By that time the boar was better and a telegram stopped shipment of the second one.

The five pigs entered in the Exeter High School contest were sold at 7 cents per pound. Collin Montgomery won first prize, and C. Balaam second.

HORSES, SHEEP, GENERAL.

Six Shropshire rams arrived from England last week for the F. A. Mechem flock.

Weight of American fleeces has been increasing year by year according to U. S. Dept. Agr.

Appointment of an Alameda county veterinarian is being agitated to guard against epidemics.

The U. S. War Dept. recently advertised for bids on 50,000 horses and mules; and the lowest bid at San Francisco was \$157 a head.

The U. S. Sec. of Agr. has appointed an advisory committee of 5 members to supervise all livestock sanitary and quarantine questions.

The F. A. Mechem Estate recently bought four American Merinos from the Hansen flock of Utah and two Rambouillets from Ohio.

Miss Betty Park of Santa Barbara county bought a purebred Romney ram at P. P. I. E. but has since been unable to get purebred ewes.

American sheep raisers will receive about \$75,000,000 for this year's wool crop. The country averages about 37,000,000 fleeces annually.

The Stanislaus Live Stock Show and Exposition Sept. 18 to 23 will follow the same lines as the Chico fair with addition of fish, lumber, baby, and school displays.

Hanford merchants are planning a guarantee fund for the Kings county fair since the supervisors could not help this year. Baby show here too.

A. H. Tilton of San Bernardino is moving his Percheron stock to Prescott, Ariz., where he also has some 60 purebred Herefords. Five registered mares will be sold, but the stallion, Loussett, imported from France by McLaughlins, will be sent to Ariz.

"Eureka" clover is advertised as yielding 300 tons green forage per acre in Oregon. This is the same plant that was widely advertised and distributed in 1893, and later, says U. S. Dept. Agr. It was tried out at many experiment stations and on many farms, but never came into favor.

DAIRYMEN AND DAIRYING.

H. O. Smith of Tipton recently bought 34 registered Holsteins.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

SWINE.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sizes used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. R. Cunningham, Mills, Sacramento County, Calif.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEYS—All ages. We have produced hogs weighing 240 lbs. at 7 months, at a cost of 3 1-10 cents per pound, including pasture, grain and upkeep of sow. If you want some of the kind it pays to raise, we would suggest that you order immediately, as our spring stock is going rapidly. Haden Smith, Woodland, Route No. 1, Box 84D.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sexes. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

REGISTERED DUROC-JERSEY—Weanlings, shoats, pigs and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

Herd of Holsteins Headed by Prince Gelsche Walker and including 22 of His Daughters

Breeding animals in the registered Holstein herd at Santa Anita Rancho are the result of careful selection in which the requirements are high individual quality, heavy and persistent production, and proven transmitting ability. All females are placed on official test as they freshen. A few splendid young bulls out of A. R. O. dams for sale at prices well within their value. **SONS OF THIS FINE HERD SIRE FOR SALE.**

A 34 POUND BULL IS NOW OFFERED FOR SALE

The name of this youngster is DUKE CORNUCOPIA SARCASTIC 157545. Born February 14, 1915.

His dam: ALBA SADIE CORNUCOPIA 138651. As a 4-year-old she made 28.85 pounds of butter in 7 days, and just recently as a 5-year-old she increased her record to 34.13 pounds butter under official test. This is the largest butter record ever made by a cow in 7 days in California. She is a splendid individual, and a persistent producer. She is sired by SIR SADIE CORNUCOPIA, 34 A.R.O. daughters, 3 above 30 pounds butter in 7 days. He by Aeggie Cornucopia Johanna Lad, 97 A.R.O. daughters, 3 above 30 pounds, and out of AAGGIE CORNUCOPIA PAULINE 34.32 lbs. butter in 7 days, 128.98 lbs. in 30 days. This cow held the world's record for 8 years, and she is the dam of SADIE VALE CONCORDIA 4th, who has over 40 pounds of butter in 7 days to her credit.

His Sire: WOODCROFT DE KOL SARCASTIC LAD, already has 2 A.R.O. daughters, one a 20.03 pound 4-year-old. He is by AAGGIE CORNUCOPIA 3d LILITH, 21 A.R.O. daughters. His dam is a splendidly bred cow, sired by a son of DE KOL 2ND'S BUTTER BOY 3D. We guarantee this bull to be a breeder.

Also Percheron Horses, Mammoth Jacks, Berkshire and Poland-China Hogs. Correspondence Invited

Anita M. Baldwin

W. H. TAYLOR, Superintendent

SANTA ANITA, CAL.

Reports of tests were received Apr. 28 and 29 for 553 Holsteins which averaged 422.3 lbs. milk containing 15.327 lbs. fat in seven days.

The Kerman High School agricultural director planted several varieties of stock beets last December on the poorest ground and is now feeding them to milk cows. The cost of production is about \$1.05 per acre. Milk flow increased and is being recorded.

F. Stenzel, San Lorenzo Holstein breeder, reports the recent sale of five choice service bulls: one to E. F. Young, Modesto; one to S. D. Chapin, Kerman; one to Lemos and Hans-

Some 50 cattle died of blackleg in the Bellota section and into Calaveras county within three days. Farmers at once got busy vaccinating.

A herd of 400 cattle from Merced county attracted considerable attention on the Kansas City market recently. One steer weighed 1560 lbs. and sold for \$171.60. He never had any feed except Cal. wild grasses.

STATE RECORD COW INHERITS PRODUCTION.

[Written for Pacific Rural Press.]

That high-producing dairy cows are the result of carefully mating animals of different sex, rather than a happen so, is pointed out by F. Stenzel of San Leandro, owner of the Holstein cow Marie Clothilde Pontiac Creamelle, who recently made a California State record for two-year-olds by producing 391 pounds of milk containing 22.52 pounds of butter in seven days.

Marie Clothilde Pontiac Creamelle, State record Two-year-old Holstein.

On both her dam's and sire's sides, this cow traces back to high producing animals, the dam having a seven-day record of 23.90 pounds of butter and being sired by King of the Pontiacs 4th, a son of the great sire King of the Pontiacs.

The sire of Marie is Mr. Stenzel's herd sire Dutchland Sir Pietertje Creamelle, which already has five A. R. O. daughters and is out of Dutchland Creamelle with a record of 23 pounds of butter. The grand dam of this bull on his dam's side is the former world's record milk cow Creamelle Vale and his grand sire on his sire's side is the noted bull Pietertje Hengerveld Count De Kol which has more than 50 producing sons, 48 producing daughters and 99 A. R. O. daughters.

Marie freshened June 4, and was started on test June 11, being two years, one month, and 27 days old when the test was begun. She was fed alfalfa hay, wet brewer's grain, dried beet pulp, ground barley, and bran while on test. She dropped a bull calf, of which great things are expected later. Marie is essentially a California product, having been bred and raised on the Stenzel ranch.

Which Will You Have Next Winter?

NOW IS THE TIME to decide whether you will feed your cows silage next winter and get 25 per cent more milk, or keep them on dry feed and be content with smaller, less profitable returns. In addition to the extra feeding value of silage, it is the cheapest feed you can use. When silage is fed, feed bills can be reduced 15 to 20 per cent.

TO BE SURE OF SILAGE of the best quality for next winter's feeding.

PLACE YOUR ORDER NOW FOR AN IDEAL GREEN FEED SILO

YOU WILL THEN HAVE AMPLE TIME to get your silo erected before the crop is ready. Delay may mean extra expense, or even failure to get the silo up in time. Decide now to have an Ideal—the silo that will give you better service, dollar for dollar invested, than any other.

THE LOW PRICE OF SOME MAKESHIFT SILO may seem attractive, but the man who puts his crop in such a silo takes a big chance with valuable feed. He may lose many times the small amount he thinks he saved on the first cost.

THERE IS NOTHING MYSTERIOUS about the superior value of the Ideal. Every feature is the result of long experience in silo manufacturing, and the superiority of this silo has been proved by actual service on Thousands of Pacific Coast farms. Every detail in the selecting of the materials and the manufacturing and fitting of the parts is clearly explained and illustrated in our large silo catalogue. Ask for a copy of the catalogue and read it. Get all the facts about this silo clearly in mind. It will pay you. Better still, place your order at once for an Ideal, so that you will be sure of getting it in time for filling.

AGGIE GRACE PONTIAC CREAMELLE
Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Klondyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915. Write or call and see the herd.

Preparation for Robber Cow Competition

(Continued from page 73.)

main consideration and no unnecessary changes in milkers being made.

Besides 20 to 35 pounds of silage, he got his cows to eat as much timothy and alfalfa as possible, together with 10 to 15 pounds of concentrates, the amount of the latter depending upon the time of year and the length of time the cows were along in calf. Each cow was carefully watched and only fed the amount she would clean up. After the morning milking they were fed a handful of salt apiece and were supplied with a continual supply of fresh water. In Wisconsin, as may be expected in California, the ration fed to the competition cows varied widely in kinds of feed and total amounts fed.

It should be expected by contestants that much heavier feeding will be necessary to secure maximum records than would ordinarily be practiced with the entire herd.

Use Cheapest Feeds.—In this connection, however, the dairyman or breeder should reduce as far as possible, the cost of production by utilizing to the fullest extent the feeds grown on his own farm. This was pointed out in the report of the Wisconsin competition by the University in saying that, "if protein feeds, like alfalfa, clover, peas, oats, etc., are available in abundance, the feed to be purchased may be of somewhat starchy character, like mill refuse and ground feed, rather than high protein feeds like oil meal, cottonseed meal, distillers' grains, etc." They further state that the feed bill may be greatly reduced by providing an ample supply of corn silage, alfalfa hay, and farm grains.

As most readers will understand, alfalfa is the basic feed which most California rations will be founded on, but the experience of those who have done official testing in the past indicates that alfalfa can be profitably supplemented with any of the following feeds: corn, silage, beet pulp, bran, barley, stock beets, carrots, and green alfalfa. Other grains and prepared concentrates can of course be fed in connection with alfalfa, but as above outlined, it should be the practice, whenever possible, to use feeds grown on the farm, and in as large variety as practicable.

Type of Cow.—As to the type of cow most apt to make a large record, the Wisconsin contest showed that the differences in the average production of the various cows were largely caused by the differences in the size of the cows, the records of the individual cows in each breed showing that the heavier cows, as a

rule, ate and produced more than the small cows and at greater economy of feed.

The data also showed plainly that the highest producing cows were also on the average, the most economical producers. True, the cost of feed eaten by those cows was considerably higher than for the low producers; but since the products obtained were much more valuable than the feed consumed, and since a larger proportion of net energy can be used for production in the case of such cows, the net returns were increased to a far greater extent than the increase in cost of feed.

As above stated, specific instances of California experiences will be given later in these columns, but a resume of the Wisconsin data, as given, indicates that the large-framed well-bred cow, carefully fed, is the one that may be expected to make the highest record, whether she be in the purebred or grade classes.

One suggestion which might be profitably given and acted upon at this time is to give the competitive cows as much rest as possible before entering them, and to have them in good physical condition by careful feeding when the starting gun trigger is pulled November 1, by which time complete details of prizes and regulations will have appeared in these columns.

WELL-BALANCED HOG SALE.

[Written for Pacific Rural Press.]

From the amount of correspondence he has received from all over the Pacific Coast inquiring for catalogs, W. M. Carruthers is expecting one of the largest and most representative crowds of Berkshire breeders at his first annual sale, ever assembled in the West.

He attributes this largely to the exceptionally choice lot of hogs he is offering and to the further fact that practically all of them are direct descendants of Rival's Champion Best, claimed by C. F. Curtiss, Dean of the Iowa Agricultural College and president of the American Berkshire Association, to be the premier sire of the breed.

While there will be a large number of outstanding show animals offered in the sale, which will appeal to the most discriminating exhibitor of show animals, there are others catalogued of the same breeding but not carrying all of the fancy show points. These will afford new and old breeders an unusual opportunity of strengthening the blood lines of their herds. It is fair to assume that these will be knocked off at lower prices than those ordinarily received at private sale.

But no one realizes more than does Mr. Carruthers, the fact that the farmer's trade is the one to cultivate. To supply farmers with service boars, which are certain to improve the quality of their grade herds, he has selected an unusually attractive lot of young ones that will be ready to put into the fall breeding pens.

Taken as a whole, a better balanced sale of livestock has never been held in the West than the first annual sale of Carruthers' Farms.

As a compliment to Mr. Carruthers, it may be said that he is the first hog breeder in the State with sufficient confidence in his breed and his herd to inaugurate the annual sale plan. Because of that fact, he fully expects to sacrifice heavily on some of his best animals, assuming this loss in order to aid in putting the auction sale idea on a permanent basis.

BERKSHIRES YOU NEED AT

Carruthers Farms First Annual Sale

MAYFIELD, CAL., AUGUST 2.

Forest Grove Laurel 2nd, Dam of 2 sows and 3 boars included in our offering.

But individuality is not the only good feature of this sale. In breeding also they fit every need. 40 of the 47 head to be sold carrying the blood of the Premier Berkshire sire, Rival's Champion Best, the One great Sire of the Present Generation.

SEND FOR YOUR CATALOGUE NOW and acquaint yourself before the sale with pedigrees and descriptions of the animals to be sold.

Veterinary Queries.

[Answered by Dr. H. B. Winttingham, Petaluma.]

COLT RUPTURED.

To the Editor: A colt was foaled a month ago ruptured. His intestines came down with his testicles. When should he be operated on and is it likely to be successful? Should he be castrated at the same time? The rupture is getting bigger.—E. M., Stockton.

[The sooner this colt is operated on the better. Castration is performed the same time the rupture is remedied.]

CALF NOSE STOPPED UP.

To the Editor: A two-months calf began to run at the nose; then it became difficult to breathe. Before it died, you could hear it moan when it breathed, for 100 yards. After it died, its eyes, mouth, and nose became bloody. Is it contagious?—C. E. T., Visalia.

[This was pneumonia. Treatment at times gives relief. Its infectiousness to other animals depends on the cause of the trouble.]

MILK FLOW DROPS.

To the Editor: A cow giving 40 pounds milk per day dropped to 16 pounds in two days. Seems healthy, eats and drinks all right. Slobbers a little. Has alfalfa pasture, and alfalfa hay twice daily. When I begin milking there is something like clotted milk in each teat. She got musty hay a week ago; but that did not affect the others.—J. T., Woodland.

[Give this cow 2 lbs. epsom salts dissolved in one gallon hot water. Follow three times a day with one ounce fluid extract phytolacca and one dram hexamethylamine.]

SWELLING ON MARE.

To the Editor: My thirteen-year mare gave birth to a colt in March. About a month later, a swelling or enlargement came on her right side, low down in her flank. The enlargement is hard and sometimes seems concentrated in one spot and at other times extends over a greater space. Mare and colt are both apparently in first class condition. Mare runs and trots as if enlargement gave her no pain.—M. J. P., Gilroy.

[Probably an abscess. Have your veterinarian attend to it.]

COW SEEMS IN PAIN.

To the Editor: My cow kicks and paws the dirt, lies down, rubs her head on the ground. Had been feeding vetches and oats twice a day with upland pasture; but since she has been sick, have fed hot bran mash and alfalfa meal with upland pasture. Has good appetite.—S. S., Fortuna.

[The feeding of vetches, especially if ripe, at times causes poisoning. Give 2 lbs. epsom salts in one gallon hot water, and change the feed from vetch. Perhaps there are poison weeds in the pasture.]

FLIES—UNDEVELOPED TEAT.

To the Editor: Will air-slaked lime keep flies from breeding in horse manure if the lime is sprinkled liberally over the manure daily? What is the most economical way to keep flies off from cows? My heifer freshened two months ago. She was running on wild pasture; but now and most of her life she has been kept in a corral and fed alfalfa hay. Since freshening she has had good wild hay. Her teat seemed not developed; this part of her bag stayed swollen and caked longer than any other quarter. The milk looked poor. She is now giving six quarts per milking. She seems well, but the teat gives a corresponding amount of milk. Does not get bet-

Nothing But the Sheet of Metal Itself is Used to Make

AMES-IRVIN Irrigation Pipe

Neither solder or rivets are used in its construction. Each sheet is edged, locked together and then set down under 3500 pounds pressure. Such a seam will not break or leak. It is simple, solid and strong, with no holes in the steel.

Ames-Irvin Lock-Seamed irrigation pipe was the first prize-winner against all competitors at the Sacramento State Fair in 1913 and the Fresno and San Jose County Fairs in 1912.

ter or worse.—T. N. M., Chowchilla.

[If you use enough lime, yes. Spray the animals with fish oil just before milking. The teat is undeveloped and is unable to carry off the product of that quarter.]

SWELLING ON MULE'S NAVEL.

To the Editor: A few days ago a swelling started around the navel of one of my mules, the second day showing a few drops of blood. It is now about the size of two hands and appears to be getting larger. I have been feeding very heavily on barley hay and alfalfa lately, besides about three quarts of rolled barley. Team has been working; and shows

no ill effects at all from swelling.—W. L. S., Cabazon.

[Cannot give the cause without an examination in this case. Paint the swelling and surrounding parts with tincture of iodine twice a day.]

A dairyman says his cows were crazy for sorghum silage at first, but after he had fed it straight for a week their milk flow dropped. When he alternated the silage with alfalfa they picked up again, and cleaned up both the silage and the hay.

Two hog cholera cases were found in Kings county last month.

Farm Poultry for Profit.

HOW BEST TO DISPOSE OF SMALL HENS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The small hen is such a numerous proposition in California that "how best to dispose of her" is getting to be a problem. Towards August the markets are flooded with them because everybody is culling out the flock for winter; also the molt is on, and it is desirable to get them off before the hens are denuded of feathers. Now the signs all portend an early molt in this section and very possibly it will be so all over the state on account of the dry spring we had.

On a postcard dated July 8 I find the prices for small hens, or rather, to be exact, "Leghorn hens, Good," (that is the way the card reads), the price is 17 to 18½ cents per lb.—firm; for large colored hens 19 cents per lb. firm. Never before that I can remember has the Leghorn hen been quoted so near to the large hen in price.

This should certainly be encouraging to Leghorn breeders and it should encourage them to breed more of the kind called "Good." This means a hen weighing four pounds or over. To be good for layers and breeders Leghorn hens should, when in condition, weigh four pounds.

So at that price no one having small hens to dispose of ought to hesitate or fuss around about how to dispose of them. Just pen them up in rather close quarters for two weeks and feed them a good mash moistened with sour milk or buttermilk, giving plenty of green feed between times to increase the appetite, and good clean water to drink; and your hens will easily pass in the class called "Good." A hen weighing three pounds and over, that is running on range and laying, can easily be made to tip the four-pound notch if confined and fed the limit. Most of them will quit laying directly they are confined. As they do not run around, all food will go to making flesh. It is generally conceded that muscles that are used in constant exercise begin to put on flesh as soon as the exercise is stopped. The mash should consist chiefly of fat or flesh-forming foods, such as cornmeal, ground, sifted oats, white middlings, or low grade flour; these mixed with sour milk are all very fattening. Give no bone meal or minerals, not even grit is necessary for the short time the birds are confined, but green feed keeps up the appetite, so it is admissible. The last week a tablespoonful of good clean tallow or grease of any kind will help—a tablespoonful mixed in the feed for each hen once a day, but no more. Too much tallow would cause looseness of the bowels.

Feed all the hens will eat three times a day, but never leave any before them. If it once gets too sour, the appetite will be lost, all increase of weight will be stopped, and the hens might just as well be turned loose.

If you have small hens to dispose of, don't let the grass grow under your feet in fixing up that pen to

start the fattening; for this is the Leghorn man's opportunity to get a fair price for his culls. As a rule 35 cents is about all a small hen will bring in open market. Just figure the difference between that and four pounds at 17 to 18½.

Incubator Chicks Die.—I ordered 400 White Leghorn chicks from Sacramento, in separate shipments, the last 100 arriving June 20. Out of the 400, I have 65 left. The three first lots I took the chicks right out of the shipping box with heads and throats dotted with lice. On one chick I counted 21 big ones. Not having anything else in the house I dusted them with sulphur, rather heavy, and that night 57 of the 100 died. (I don't blame them.) Then I got some oil of cedar; and that fixed them without losing any chicks. I opened the dead chicks; in some the yolk was all absorbed, in others it was not; some died with nothing in their craws; and in others the craw was packed full. They had no bowel trouble. We are at an elevation of 4300 feet; has that anything to do with it? What I feed: First meal, stale bread crumbs sprinkled in the litter, and finely crushed egg shells; next meal, bran sprinkled in litter, pinhead oats, chopped lettuce, charcoal, and a little cracked wheat. When a week old skimmed goat's milk diluted, then whole wheat very sparingly six meals a day. Feed is too high here to have much variety. Some tell me bran is not good for little chicks. Am growing millet for next year and hope that will be good for them. How I brood them: I raise them in padded cold brooders, each box 22x16 for 25 chicks, all hovers made from cheese cloth bags filled with chicken feathers or goat wool in soft washed flour sacks, with extra blankets for bad weather. The chicks are on the ground with sand under them; litter and everything is scrupulously clean. Sickness always starts about the 5th day and their legs won't carry them. They have both shade and sunshine and are perfectly clean and I watch them from 5 o'clock in the morning until 9 at night.—M. C., Stacy, Lassen Co.

[Concerning the lice, any man who would send incubator chicks out with lice on them ought to be put out of business; he is not fit to run such a business; and as for dusting baby chicks with sulphur, that is almost as bad. I don't blame the chicks that were so treated for dying; they could do no less because the sulphur paralyzed them. Then again the feed is not right. Had the bread been sliced and roasted through, then rolled and spread where the chicks could reach it easily they would have been better nourished. A mixture of rolled oats and bran put in shallow dishes is better for baby chicks than giving bran alone or giving pinhead oats. Rolled oats are partially cooked, therefore easier to digest. I believe the trouble with these chicks has been that they have been poorly nourished at the start. The lice robbed them of some vitality, then the feed was hard to find and not good enough; instead of crushed egg shells, in a case like this hard-boiled eggs and toasted bread would have been better, followed up with bread soaked in goat milk, and instead of waiting a week before giving the diluted goat milk give it at the start. If it is not possible to get a variety of feed in this place, why not buy a small mill—even a good-sized coffee mill would do—and

grind up your wheat. No chick at one week old can be well nourished with the small amount of whole grain it can digest. Chicks running with hens will do much better because the hens look after their wants. The whole trouble seems to be a lack of nourishment. I don't think altitude has anything to do with it; neither was there anything wrong with the chicks, because chicks that would stand that treatment were sure all right. About the millet, let me warn you not to feed it too freely. It is a case of a little being a good thing and too much a bad thing; too much millet is a sure cause of bowel trouble. If bran is given from the start it never causes trouble and may be given in quantity, but it is more nourishing when given with half its bulk of rolled oats. Instead of sand for a bed in cold brooders try litter cut in one inch lengths; it is more comforting and also prevents the chicks from piling up on each other. All your troubles are preventable, so do not get discouraged but try, try again.]

GUINEAS.

To the Editor: What is the best feed for baby guineas?—M. F. Mc., Paso Robles.

[Feed same as common chicks—nothing at all for the first 48 hours. When they can take care of themselves, let them run in the garden to clean it of bugs. An ordinary hen makes a better mother than a guinea hen because she is not so excitable.]

Mr. F. L. Hall reports that there is a noticeable and growing tendency in the Petaluma district to abandon the poultry colony or small house and range system. Instead of scattering these small units over a large area, the drift is now toward more intensive and labor-saving methods which are possible when the long house and scratching shed plan is adopted.

Giant marrow cabbage, which sometimes grow as tall as a man, is recommended by the Washington State Experiment Station as an excellent green food for poultry. This plant sheds its leaves as it grows.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

I am afraid a good many of us are not going to load our pantry shelves with canned and preserved fruit this summer, as we usually do, owing to the high price of sugar.

Those who live in the country have the advantage of having your own fruit, which the city dweller often pays a very high price for.

Canning without sugar has been tried for some time and with considerable success and this is a very good year for all of us to give it a trial.

In the case of large fruits, such as peaches, pears, etc., you cook the fruit until tender in boiling water and seal while hot, and it keeps just as well as though cooked in a syrup, for it is not the sugar that makes it keep anyway, but the sterilization. Of course, when these jars are opened for use, the contents must have sugar added, but by that time, it may not be such a luxury.

Small fruits, as berries, can be cooked and strained and sealed boiling hot in jars and this liquid used for jelly making or for beverages with other fruit juices.

I know of no way whereby you can make fruit butter and preserves without sugar, but I do know a way of cooking them without the tiresome stirring and that is to put them in the fireless cooker after they have been well heated on the stove. They may need to be re-heated once or twice and put back, but that is far easier than cooking on top of the stove and getting spattered by flying bubbles of syrup.

I hope you have tried the apricot and pineapple marmalade recipe that appeared last week. It is delicious—the only fault it has is that it disappears too rapidly. Yours,

Rosabella Best.

HOW TO EAT AVOCADOS.

To the Editor: I lived for many years in the Hawaiian islands and took particular interest in the growing of avocados, mangoes, bananas, and other tropical and subtropical fruits. In the islands the avocado is not principally used as a salad, but the fruit is merely halved, the seed removed, salt and pepper applied, and the fruit eaten as cantaloupes are. They are served at each of the three meals. They are cut up and used in soups after the soup is on the table, and are used there to some extent as a salad.

We usually picked the fruit and laid them away for a week to ripen and mellow. Even apples would hardly keep longer in the tropics.

If a good flavored keeping fruit like the long green variety or the purple avocado can be grown here, I see no reason why this fruit should not become popular and profitable.

The taste for the fruit must be cultivated, as few like it at first; but it is the most popular fruit, barring the mangostine, grown in the tropics. But it must not be forgotten that there is as much difference in the shape, color and flavor of avocados as there is in apples or plums.

Hugh M. Coke.

MAKE "KOUMYSS" AT HOME.

Try a little of this refreshing drink for hot weather. Dissolve a third of a cake of compressed yeast in a little tepid water; take a quart of milk fresh from the cow, or warmed to blood heat, and add to it a tablespoonful of sugar and the yeast. Put the mixture at once into beer bottles with patent stoppers, and let them be full up to the neck. Let them stand twelve hours in a temperature that would raise bread, then set on ice with the bottles upside down until wanted.—Mrs. Swaysgood.

WEDDING CAKE SUPERSTITION.

Have you ever tried sleeping on wedding cake for a week and pulling out a named slip each morning until you eliminated all but your fate? It is great fun, especially when several girls do it together. You do not make out your own list, but a friend's, and she makes out yours, so that you are surprised. Five of the slips are named for five boy friends, one slip is for the old maid and one for the stranger, whoever he may be. One must not peek to see who is left, but every morning, one more person is eliminated. The suspense makes this little pleasantry very exciting. You can't honestly believe this method, of course, and it is most provoking to draw the name of your best friend the very first morning, but it is an interesting way of deciding one's fate.

FASHION NOTES.

Sprigged muslins are revived for the summer girl's frock.

Cape effects on some of the summer blouses show deep hemstitched borders.

An overskirt of taffeta looped up over a cream lace underskirt is quaint and offers possibilities for short lengths of silk.

Pongee is having a great revival of popularity, both for dresses and light weight suits.

The stores announce that skirts are to be longer this fall.

Felt hats are being shown in the shops, many of them white, for early fall wear.

Middy suits of either plain or striped materials continue to be popular.

HAM SANDWICHES.

Ham sandwiches are much more dainty and appetizing if the ham is finely chopped and chopped pickle be added. A little salad dressing is an improvement also. Cut the bread into thin slices and trim the crusts.

INTEMPERANCE IN FOOD.

Some one has rather aptly said that "one-third of what we eat enables us to live, and the other two-thirds provides a living for the doctors."

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

If you have not planted your fiesias, do so at once, as described in former article. The main reason so many fail with this bulb is because they are not planted early enough. You can plant a second lot next month for later bloom.

Pelargoniums that are in pots will have finished blooming by this time and should be started to dry off. It takes a month or six weeks to do this correctly. Put them in a shady place and gradually withhold water, but do not let them get so dry that the leaves turn yellow. Further directions will be given later.

If you have not mulched and staked your "mums," do so at once, and give them plenty of water, both at the root and foliage, for this is the time they require it most and you cannot very well overwater them. As soon as the feeding roots run up into the mulch, give liquid manure every other watering. If the foliage should turn yellow or light colored, it is a sign of over-watering or feeding. Withhold water for a few days and top dress around them with powdered charcoal or hydrated lime—or both can be used.

If you have not sown cineraria, calceolaria, primulas, etc., for early spring blooming, do so at once. The seeds mentioned are very fine, like so much dust, and have to be planted very carefully. Sow them in boxes of light sandy soil, mixed with fine leaf mould and give thorough drainage. Water the soil before sowing. Sow the seeds on the top of the ground and do not cover with soil, but cover them with moss chopped very fine, which should be removed as the seeds germinate. Cover the boxes with a pane of glass, which must be left on until the seeds germinate. Then raise the glass a little at one end. As soon as the young plants are large enough to handle, they should be pricked out into boxes of the same kind of soil and planted one inch apart. Remember these seeds do not require heat to germinate and should be kept as cool and shady as possible. They like a temperature of about fifty degrees. They require from three to four weeks to germinate.

If you want some early pansies, they should be sown this month, in boxes of finely prepared soil and the seeds covered lightly with leaf mould. Put the boxes in a cool, shady place and do not let them dry out at any time. As soon as they germinate give them sun, and shade with a piece of cheese cloth. As soon as they are large enough to handle, plant them in fine soil, in which rotted cow manure has been added, about one-fourth cow manure. It must be thoroughly rotted. You can also sow stocks or gilly flower seeds, same as pansies. For winter blooming sow Brampton as winter stock.

KEEPING FLOWERS.

All flowers with porous stems like chrysanthemums keep much better if dipped into scalding water, before putting into vases.

lighter, flakier
biscuits

Steady, evenly distributed heat, under perfect control makes a good oil stove wonderful for baking.

NEW PERFECTION OIL COOK-STOVE

For Best Results Use Pearl Oil

A good oil stove is just like cooking with city gas. If you haven't a New Perfection you've missed comfort for years. Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate. Cuts out the coal-hod and wood-box drudgery. Keeps your kitchen cool. The long blue chimneys prevent smoke or odor. In 1, 2, 3 and 4-burner sizes, ovens separate. Also Cabinet Models with Fireless Cooking Ovens. Ask your dealer today.

HER STENT.

Great-grandmamma knit on a stocking;

And six times around, ev'ry day,
Was the stent for her bright, clicking needles,

Before she could go out to play.

And Grandmamma sewed on some patchwork,

A blue and white block was her stent,

Until a whole quilt had been finished.

Oh, how many stitches that meant!

Mamma had a stent that was different;

She sat on a high screwed-up stool
Before the piano, and practiced

Her scales, ev'ry night after school.

I wonder if I should like knitting?

Would sewing be easy for me?

Perhaps they'll want me to learn music.

I wonder what my stent will be!

—A. M. Farrington, in Little Folks.

GRUMBLE-BOY AND SMILEY-BOY.

In the Jones house there were two small boys, Johnnie Grumble-boy and Johnnie Smiley-boy; but no one ever saw both at once. At first they hardly realized, this little boy's father and mother and Aunt Emma, that there were two boys; but when one morning a little chap came down to breakfast with a big frown on his face, and blue eyes that were so cross that they looked nearly black, and when pleasant remarks from the family had no effect in making the boy look pleasant, they were obliged to make up their mind that a strange little boy had come to take the place of their pet. So they treated him with all the ceremony necessary with a stranger, and pretty soon he found himself feeling strange and queer.

But he wouldn't tell any one that

he felt strange. Not a bit of it. He was not that kind of a boy. When he came down feeling that way, why, everything was wrong. The oatmeal was too salty, his milk didn't taste right, and his egg was boiled too hard; and he just didn't want to wear his old cap to kindergarten,—it wasn't comfortable at all.

This sort of thing went on for some time, until Aunt Emma made up her mind that some remedy must be thought out. The mornings when Smiley Johnnie came down, there was the happiest little boy around the house all day, and home was a very different place from what it was on Grumble-boy's days.

So auntie thought and thought, and one day, when Johnnie came down, and it was the Grumble-boy Johnnie who climbed up to the seat beside father, he found a great change in the atmosphere of the family table. Usually when he came down looking frowning and sour, and complained about everything, the kind members of his family tried to persuade him by cheerfulness that things were not so far wrong as he thought them. But to day it was different.

"This hominy is too hot," piped a small voice.

"It is entirely too hot," Aunt Emma agreed sulkily.

"Mine's burning my mouth," mother said sadly.

"Mine's simply scalding," growled father.

Grumble-boy looked up surprised, and for five minutes there wasn't a word said.

Then came the boiled eggs and toast.

"My egg's too hard," growled Grumble-boy before he thought, just because he was in the habit of saying it when he felt cross.

"So's mine," wailed auntie.

"And mine," sobbed mother.

"Mine's like a rock, it's so hard," growled father.

Grumble-boy could hardly keep from smiling, it was all so like the good old story of Silverlocks and the three bears; but he'd come downstairs feeling cross, and it was his habit to stay cross.

And then the finish came when some lovely hot griddle-cakes were brought on. Grumble-boy wanted to complain just because he felt like it. So, after he'd poured maple syrup over his cake, he touched it with his fork and grumbled,—

"These cakes are tough."

"I can hardly cut mine," wailed mother, in a tearful voice.

Father started to cut his just then, and so did all the others, and at the same time father growled, "Shame to send such tough cakes to the table," and the cakes simply fell apart on their forks and everybody burst into a roar of laughter.

After that, when by chance the Grumble-boy appeared at breakfast, it was enough for auntie to say, "Johnnie, are your cakes tough this morning?" to break the clouds and bring back sunshine.—Examiner.

A Chinese couple, passing through this section on their honeymoon, severely criticise divorce. Any couple spending a honeymoon who could find anything enjoyable in the specter of a divorce would constitute the eleventh wonder of the world.

There is Japan tea, for instance.

You may drink it because you like tea—but it's possible that you would like some other tea-taste even better. Schilling's Best offers you four distinct taste-types of tea, and a simple inexpensive way to pick your favorite.

MUTUAL FIRE INDEMNITY.*[Written for Pacific Rural Press.]*

A little-known, but very important, advantage of a citrus fruit packing house belonging to the California Fruit Growers' Exchange is the "Mutual Indemnity Compact" by which fire insurance is provided for each house by all of those who enter the Compact. They save 65 to 75 per cent of insurance rates, according to P. J. Dreher of Pomona.

In the 10 years it has been in operation, only about five losses have occurred; and no one has ever refused to pay the assessment levied on all members to cover the loss.

Every member-packing-house is rated according to its value and fire risk. Its indemnity in case of fire, as well as its proportional assessment for losses of other members, is based on this rating.

An inspector is paid for continuous effort to keep member houses up to the rules for fire prevention. These rules require chemical extinguishers in each house, fire hose attached to plugs ready for use, alley-ways among boxes' shook, etc., so every part of the house is readily accessible, no smoking, no sawdust cuspidors, no oil waste except in tin cans, no gasoline vehicles stabled within 15 feet of the house, electric wiring through conduits, all oil drip kept off floors, timber, and shook, etc. The only expense of the "Mutual Indemnity Compact" is for inspection and actual losses.

CUCUMBER SALAD.

A good cucumber salad is made as follows: Pare and cut in half, crossways, two cucumbers. Hollow out the seeds and fill with a stuffing made of three olives, one cold boiled chicken liver, a little stalk of celery, one pimento, one gherkin. Chop these ingredients very fine, add the juice of an onion, four drops of tabasco and enough mayonnaise to make a paste; add a teaspoon of honey, and stuff the cucumbers. Slice them, when chilled, onto white lettuce leaves and cover with mayonnaise, laying a green pickled cherry on top.

The admiration which Bob felt for his aunt Margaret included all her attributes. "I don't care much for plain teeth like mine, Aunt Margaret," said Bob, one day, after a long silence, during which he had watched her in laughing conversation with his mother. "I wish I had some copper-toed ones like yours." —Youth's Companion.

A FEW AIDS TO CLARIFY FASHION CHATTER.

BRASSIERE—An undergarment like a short corset cover, worn over the bust and over the top of a low-cut corset.

SPANISH FLARE—The effect of a skirt for a little ways below the waist, that makes it seem as if it stands free from the hips; this effect is secured by a lining of horse-hair lace.

FITTED CORSAGE—One that generally follows the lines of the body; as contrasted to a box effect.

HIGH TOQUE—A toque trimmed to make the headgear have a sugar loaf appearance.

FIGURE CORSET—A long corset coming well down over the thighs to give the figure a continuous line.

TAM—A Tam-o'-Shanter cap.

NEGLIGEE—A light, loose, dressy house gown.

BODICE—The part of a dress cut separately to fit about the waist.

TETE DE NEGRE—A new dark brown color, supposed to be the shade of a field mouse.

REVERES—Decorative folds of fabric flowing back from the V-shaped front opening of a blouse.

JAPANESE SLEEVES—Sleeves with wide, flowing cuffs.

SMOCKING—A decoratively gathered part of a dress to take up excess material.

TUNIC—A short overskirt to be worn over a long skirt.

Little Millie's father and grandfather were Republicans; and, as election drew near, they spoke of their opponents with ever-increasing warmth, never heeding Millie's attentive ears. One night, as the little maid was preparing for bed, she cast a fearful glance across the room, and whispered in a frightened little voice: "O mamma, I'm afraid to go to bed. I'm afraid there's a Democrat in the closet."—Organizer.

Forty per cent of the high explosive makers and shell packers in Germany are women, while 5 per cent of the makers of tents, haversacks and similar equipments also belong to the same sex, and in the manufacture of tinned meats and preserves 75 per cent of those employed are females.

The Soft Answer.—"What would you do if you were in my shoes?" inquired Polly after her tiff with her best friend.

"I'll tell you what I'd do," said the B. F. candidly: "I'd buy a pair about two sizes smaller."

B. V. D.s And A River Breeze--- Isn't This Great On A Hot Day?

WHEAT.

All northern wheat is still coming by rail, and with light supplies on hand club has been marked up. Sonora shows a slight advance, the market in general is fairly firm, though there is no heavy demand. Sonora Wheat\$1.72 1/2 @ 1.75 Northern Club 1.72 1/2 @ 1.75 Calif. Club, ctl. 1.70 @ 1.72 1/2 Northern Bluestem. 1.82 1/2 @ 1.85 Northern Red 1.80 @ 1.90

BARLEY.

Considerable demand for shipping, shipping and brewing grades firm, being quoted a little higher on spot. Feed is firmer in sympathy. Shipping, ctl.\$1.45 @ 1.47 1/2 Choice Feed, ctl. 1.40 @ 1.45

OATS.

Samples of the new crop black oats have appeared, but there is not enough business yet to establish values. Red oats have been marked up rather sharply, as the crop is light and buyers are taking interest. White also are higher, but show less strength. Red Feed\$1.60 @ 1.65 White 1.60 @ 1.62 1/2

CORN.

Old California yellow well cleaned up, selling on the same basis as Eastern, which is steady at old prices. Egyptian has advanced, demand keeps up well and the poorer offerings are getting cleaned up. Eastern Yellow, ctl\$1.85 @ 1.90 Milo Maize 1.40 @ 1.45 Egyptian 1.50 @ 1.60

BEANS.

The bean market shows reaction this week, as might be expected in view of extreme prices that prevailed of late. In fact, many believe that beans could hardly be worth prices recently asked under any conditions. While there is very little stock left, there are still a few scattered lots owners wish to dispose of, and prices have accordingly been reduced. The outlook for further change is uncertain, the amount of stock involved will be small at any rate, and present conditions will have slight bearing on values for coming crop. As to the latter, the general feeling is rather firm.

(On wharf, San Francisco.)

HAY.

Shipments of new crop to this market have been hampered by tie-up of river boats and shortage of cars, but arrivals are increasing, and with settlement of the river strike, greater activity is expected. Everything that has come in has found a ready market at the range quoted, and market shows a steadier tone than for some time past, although it is impossible to ship anything out by sea. Increase in arrivals has been mostly alfalfa, which has good demand, with prices well established. Supplies in hands of horse feeders locally are light, and an active buying movement should take place before long. Dealers say there is no great amount of buying in the country, where a great deal of hay is held above city market. The shortage in many parts of the country would seem to warrant growers in taking firm stand. Farmers are said to be preparing to store heavily around Stockton.

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, July 17, 1916.

The shipment of Bartlett pears from the Sacramento River district has held up longer than was anticipated a week ago. This is due in a great measure to the strike situation in San Francisco, causing a large lot of canning pears to be shipped East. This has heavily increased the Eastern shipments and to a large extent has affected the market. We look for a rapid recovery as soon as the bulk of the pears now rolling are sold.

Elbertas from the San Joaquin valley and from Placer county have ripened this year about the same time and are now moving in heavy supply. Prices, however, even in the face of eastern competition which has developed only in the last week or ten days, are very satisfactory.

Up to date the sales of deciduous fruits have been more satisfactory than for several years and we anticipate a continued good market on grapes. Late pears will also realize fancy prices due to the fact that the northwestern crop is short and the

New York state pear crop 50 per cent below normal.

Malagas are sugaring rapidly and the Fresno district will commence shipping straight cars about August 1st. Tokays will also be moving within ten days in light supply and in straight cars from the San Joaquin valley about the middle of next month.

The following prices have ruled for the week:

New York.—Tragedy plums averaged \$1.15; Burbank, 86c; Climax, \$1.08; Kelsey, \$1.20; Wickson, \$1.24; Diamond, \$1.20 German, \$1.22; Bartlett pears, \$2.24; Hale peaches, 59c; St. John, 65c; Thompson Seedless grapes, \$1.67.

Chicago.—Bartlett pears, \$2.18; Tragedy plums, \$1.54; Diamond, \$1.56; Burbank plums, \$1.30; Wickson, \$1.28; Thompson Seedless, \$1.46; Crawford peaches, \$1.22; St. John, \$1.24; Malaga grapes, \$2.07.

Total shipments to date, July 18th, 3983 cars; total shipments same date 1915, 2734 cars.

These quotations furnished by Nicholls-Loomis Co., Los Angeles, Friday, July 14th:

Barley Hay\$10 @ 14 Wheat Hay 10 @ 14 Tame Oat Hay 12 @ 16 Northern Alfalfa 11 @ 13 Local Alfalfa 12 @ 15 Stock Hay 6 @ 9 Straw 5

FEEDSTUFFS.

Rolled oats have advanced with the market on the whole grain, rolled barley is quite firm. Other feeds as last quoted, with usual movement to nearby points.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet pulp, per ton... Nominal Alfalfa Meal, per ton. 17.50 @ 20.00 Bran, per ton 28.00 @ 29.00 Oil Cake Nominal Coconut Cake or Meal 23.00 @ 25.00 Cracked Corn 40.50 @ 41.50 Middlings 35.00 @ 38.00 Rolled Barley 29.00 @ 30.00 Tankage 45.00 Rolled Oats 31.00 @ 33.00

VEGETABLES.

The river strike has caused an unsettled condition in local garden truck market, but as the trouble has now been adjusted supplies are expected to come in more regularly. The demand has been nothing extra of late, and with larger offerings values are low. The better offerings of asparagus are up a little, but there is a good deal that has to be forced out below figures quoted. Tomatoes are beginning to arrive in great quantities from many districts, and prices are down to midsummer level. Eggplant also is lower, also bell peppers and okra, though summer squash is doing better at the moment. Cucumbers are steady. Corn is plentiful, ordinary offerings clean up slowly at low prices.

Cucumbers, lugs 50 @ 75c

String Beans, lb. 2 @ 4c Summer Squash, lugs 50 @ 75c Peppers, bell, box 50 @ 75c Asparagus, box75 @ 1.00 Eggplant, lugs 75c Peas, lb. 2 @ 3c Tomatoes, lugs50 @ 1.00 Green Corn, sack50 @ 1.00 Okra, box 75c

POTATOES AND ONIONS.

High prices recently quoted on potatoes are firmly held, there is considerable demand for shipment to distant points, supplies available are light. Red onions going off the market, yellows are beginning to arrive in good shape, and prices weakening.

(On wharf.)

Potatoes, ctl., Delta ...\$1.50 @ 2.00 Southern 2.00 @ 2.25 Onions, yellow 1.75 @ 2.00 Garlic, new crop, per lb .. 5 @ 6c

POULTRY.

Local demand is picking up, but can hardly be considered active; with fairly liberal offerings from nearby points, as well as a steady influx of Eastern stock, last week's advance was not held. Young stock will not bring over 20 to 22c per lb., roosters also are rather easy, though hens clean up fairly well. Ducks lower.

Broilers, 18 lbs. to doz. and less, lb 20 @ 22c do, over 18 lbs. to doz. .. 20 @ 22c Fryers 20 @ 22c Hens, extra, per lb. 17 @ 18c Small 16c Smooth Young Roosters, per lb. 23 @ 25c Squabs, per doz. 2.00 @ 3.50 Geese, per pair 2.25 @ 3.00 Ducks 13 @ 14c Old 12 @ 13c Belgian Hares 7 @ 9c

BUTTER.

The butter market receded a little from last week's average, supplies have been coming in freely, there

has been no important outlet in shipping channels to absorb surplus. Dealers not taking more than enough for immediate needs.

DECIDUOUS FRUITS.

Berry market shows more strength than for some time, several lines quoted higher, though strawberries continue in liberal supply. Shipping business in apples has been quiet until a week ago, with considerable demand since, with orders from South America and other export markets, large inquiries from England, and good demand in Middle West. Gravenstein crop is reported quite heavy. Some storage stock is still left, but being forced out at irregular prices. Pears lower, supplies rapidly increasing. Apricots fairly firm, with moderate supplies and good demand, peaches are easier with ample arrivals, including unattractive stock. Red nectarines find fair demand at slightly better prices. Plums weak, but German prunes sell readily at fair prices. Figs higher and lighter arrivals. Cantaloupes have dropped a little, with plentiful supplies from Turlock district: watermelons remain firm. Grapes easing off as offerings increase. Some Tokays have appeared, but not quoted.

Currents, chest\$4.00 @ 4.50 Loganberries, chest 3.00 @ 4.00 Blackberries, chest 3.50 @ 4.50 Raspberries, chest 5.00 @ 7.00 Strawberries, chest 4.00 @ 6.00 Apples, Gravenstein ... 1.00 @ 1.25 Astrachan85 @ 1.00 Alexander75 @ 1.00 Crab apples, lug40 @ .50 Pears, Bartlett, bx, No. 1 1.25 @ 1.50 Other varieties50 @ 1.00 Apricots, small box40 @ .75 do, lugs 1.25 @ 1.50 Peaches, lugs 1.00 @ 1.40 Peaches, basket50 @ .75 Figs, black, bx, dble layer .90 @ 1.15 Plums, crate40 @ .75 lugs75 @ 1.00 Prunes, crate 1.25 Nectarines, crate75 @ 1.25 Cantaloupes, standard crate 2.00 @ 2.25 Watermelon, lb. 1 @ 1 1/2 c Grapes, Thompson, lugs 1.75 @ 2.00 Fontainebleau 1.00 @ 1.25

DRIED FRUITS.

There has been a fair movement of dried fruit in the country during last few weeks, local packers describe market as rather quiet, both here and the East, as present prices are considered high, buyers everywhere are disposed to proceed with caution. Growers willing to go slow, feeling that fruit is pretty sure to be worth fully as much several months in the future as now; very little really desirable stock being offered below appearing quotations, while a great deal is held at an advance. Little yet done in new apples, old stock is well out of the way and market shows signs of firmness. The local trade claims to have sufficient apricots for nearby requirements, there is no immediate prospect of renewed activity, consuming demand being

Special Livestock Market Report.

Cattle.—No improvement can be reported in the cattle situation, there still being an over-supply and while those offered are not of the choicest quality they are plenty good enough for the prices being paid. Some improvement in prices is expected in August, though it now looks as though there will be plenty of cattle all fall. Feed is becoming more of a problem and reports from Nevada say that the ranges are not at all good there this season.

Sheep.—Both Red Bluff and Nevada lambs are beginning to arrive in satisfactory numbers and a few wethers continue to come in from Oregon and Nevada. The sheep sale, however, is not at all good, the only

reason attributable being high prices.

Hogs.—A comparatively small number of hogs are arriving in face of the 8 1/2-cent top and a good many of those that are being received are of inferior quality. No change in last week's quotations can be made.

Wool.—Local dealers report "nothing doing," finding it impossible to move anything at a profit, due, they say, to the high prices that have been paid for fleece wools. There is still a lot of wool held in the country but it is reported to be mostly short or defective. Activity at unchanged prices is reported in Eastern markets and the markets all over the world are booming.

somewhat curtailed by present prices. Many shipments are beginning to come in from various parts of the country. Prunes extremely firm, with a growing conviction in the trade that prices asked are justified, but Eastern buyers are following waiting policy. Peaches rather slow sale. Raisins reported in strong demand everywhere.

Apples, old crop 7 @ 7½ c

CITRUS FRUITS.

The Eastern markets have been stimulated by the hot weather, and the demand for lemons and oranges has caused higher prices. On the New York auction, Monday, July 17, Valencia oranges averaged from \$2.35 to \$4.40 and lemons from \$3.40 to \$3.95 per box. At Boston the same day Valencia averaged from \$2.45 to \$3.90, and lemons from \$5.75 to \$6 per box.

Shipments from southern California are going east in good quantity, averaging about 70 cars of oranges and over 50 cars of lemons daily. Growers anticipate heavy lemon shipments during August and September at good prices, as there is little stock held in storage.

Prospects for the coming crop are good, there being a heavy set on the trees, with less than the usual June

drop.

San Francisco quotations are:
Oranges, Valencias \$3.00 @ 3.50
Grapefruit 2.00 @ 3.00
Lemons, box 3.00 @ 6.00
Lemonettes, box 1.50 @ 2.00

HONEY.

There has been fair movement to Eastern markets from the south, arrivals in this market still light, dealers state more could be easily disposed of, very little accumulation. According to local advices offerings in country are limited and firmly held.

Water White, comb 13 @ 15 c
Amber 10 @ 12 c
Water White, extracted 9 c

Nonpareils, lb 17½ c
I. X. L. 15 c
Drakes 13 c

HORSES.

More well-broke draft stock is appearing in the local market than for some time past, this week's arrivals included some attractive stock, market has developed more activity. The better class of horses have been hard to move at prices they should be worth, on the whole stock has cleaned up fairly well. A more active local demand for this class of stock is expected during next few months, though it is early for any large movement. A good many mules have come in, and while few are used locally, they find ready sale for shipment. Supply of horses in most parts of the country is unusually light.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

FOR SALE—A stationary engine, 20 H. P. Address S. Frank, Box 51-3, Woodland, Cal.

TREES AND PLANTS.

FOR SALE—AVOCADO SEEDLINGS for nursery planting. Avocado Bud-wood, 40 varieties. Budded Avocado trees. Newberry-Sherlock, R. F. D. 2, Pasadena.

WANTED.

WANTED—ABOUT SIXTY YOUNG MEN and women to enter the WESTERN NORMAL on August 28, 1916, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We also give a two year high school course. For information, address WESTERN NORMAL, J. R. Humphreys, Principal, Record Bldg., Stockton, Cal.

EXPERIENCED AND COMPETENT ORCHARDIST wants position as foreman or superintendent orchard or farm. Reference. Box 224, Pacific Rural Press.

WANTED—Reliable solicitors for country paper. Must furnish bond. 217 Underwood Building, San Francisco.

LAND FOR SALE.

THREE YEAR OR MORE LEASE on a 2½ acre poultry ranch on county road. Furnished six-room house. Home market. M. E. Darling, San Mateo.

DAIRY FARM OFFER—A 1 for dairy or garden truck; 80 acres 4 miles from S. P. station, 50 miles from San Francisco. Well fenced 4 fields, 3 acres fine stand alfalfa, family orchard, grape vines, large eucalyptus trees for shade and fuel; three wells, water piped to buildings and for irrigation; good improvements; 5 roomed house; large barn, milk house, granary, chicken and hog houses. Must be seen to appreciate its value. All for \$9,500, part cash. Apply or write owner, 802 Claus Spreckels Building, San Francisco, Cal.

WHY NOT COMBINE BUSINESS WITH PLEASURE on YOUR vacation? Look up some GOOD land. Send for Lists of STATE Land (any 3 counties), INDIAN Lands (Special NOW), SCHOOL Lands, services until 1917, \$5. COUNTY Sectional Maps showing GOVERNMENT Land, \$2.50 ANY County. STATE Map, showing SCHOOL Land, \$2.50. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

RESPONSIBLE AND EXPERIENCED Tenant wanted for 160 acre dairy and hog ranch, partly improved, on Kings River, Fresno County. Good water supply. Owner furnishes 30 cows and 10 young sows. Tenant furnishes work stock and machinery and continues checking and ditching. 3 to 10 year lease on shares to acceptable party able to comply. Reply to Box 223, Pacific Rural Press.

WANTED TO RENT a ranch on shares or for cash. Fruit or stock proposition preferable. Can furnish references as to ability. Address P. O. Box 31, Livingston, Cal.

FOR SALE—Nicely sheltered ocean shore land for a home or an investment. J. W. McMillen, Guadalupe, Cal.

FISK

Non-Skids

**Fisk Prices Now Are
The Tire Value Sensation
of the Summer!**

PRICE comparisons will prove that you can equip your car with Fisk Non-Skids, with their heavy non-skid traction tread, for less than you may now be paying for the plain, no-protection styles of several other standard makes. **It will be more than worth your while to make your comparisons at once.** Fisk Tires are giving greater mileage returns than ever before; they are the best tire value you can buy today.

**35,000 Fisk Dealers and
125 Direct Fisk Branches Make
Fisk Service Quickly Available**

Through your local Fisk dealer you are sure to get the promptest attention of the Fisk Branch nearest you. And if you are where you can visit one of the 125 Fisk Branches throughout the country, you yourself are welcome to make use of the most liberal Service Policy ever inaugurated by any tire manufacturer. Dismounting, inspection, air testing, inflation, mounting spare wheels, inspecting wheels for alignment—all that service, and more, absolutely **FREE** whether you use Fisk Tires or not. There is never a charge made in any Fisk Branch except for actual repairs and supplies.

Costs of Three-Year Almond Orchard.

Before planting this orchard, the marketing possibilities were investigated. Then the requirements of almond trees were studied in orchards at various parts of the State. Then varieties were selected and itemized cost accounts kept for three years.

[Written for Pacific Rural Press by C. L. Moseley, Pennington.]

THE following view of the almond business will warrant the interest, time, and money expended in advancing our orchard to its perfected state of development.

Production Limited.—The almond nut is commonly looked upon as a luxury, as was the olive, orange, and other fruits which have since become staple foods due to commercially organized distributing mediums. The history of the peanut includes more steps of evolution than any other known food. At one time it was only considered "hog feed" by the negroes. A certain far-sighted gentleman, realizing that peanuts were good enough for him to eat, decided to peddle them. He obtained concessions from the circus king, P. T. Barnum, and a few railroads, and for several years enjoyed a modern corner on the peanut business. So far ahead of the peanut is the almond as a staple food product, that it is only due to its limited production today we have not "almond butchers" in the various walks of the common "peanut butcher." Few purchasers of the almond nut from retail stores know even how it is produced and seldom does one see an almond tree except in the few naturally frostless localities having proper drainage and depth of soil. Here we have the main reason for importing 75 per cent of our consumption. California contributes practically all of the balance produced, for the most part by small growers. The present situation is literally one of "little known because exclusively grown."

Able Marketing.—Almond growers are fortunate to have as their distributing medium one of the most successful of producers' co-operative bodies, the California Almond Growers' Exchange. Ably managed, and distributing nearly all the almonds produced in this country, it acts as a clearing house for the various localized almond districts, whose association representatives meet periodically to determine the welfare of the individual grower. Like unorganized producers of other commodities, the almond grower formerly was at the mercy of the middle man and consequently a good many large tracts were grubbed out approximately five years ago. These few features secure the future of any farmer fortunate enough to own almond land. The staple market and firm prices assure success and a business opportunity which will soon advance him from the rank of "farmer" to the rating of the rural business man.

Natural Almond Land.—The Buttes Almond Orchard consists of a square forty selected from the heart of a high-land alluvial fan reaching out from one of the draws in the north slope of the Marysville Buttes. This feature provides the necessary air and water drainage as well as soil depth. The almond, being a thrifty tap-rooted tree, develops a prosperous root system throughout the 30 feet of feeding ground. Prior to planting, a blue print, showing elevation contours, designated the position of each tree with respect to fences and building sites. Resulting from this study over 3200 trees are given ample space, all trees being exactly 25 feet apart every way due to triangular planting. This feature, promoting the attractiveness of the orchard, permits three way cultivation,

and purpose is 15 to 17 per cent to tree-earning capacity per acre. No little time was devoted to variety selection, determined from experiences of prosperous growers in various almond districts visited. Prevailing winds are from north or south, so for pollenizing purposes each variety avenue, consisting of 103 trees, runs one-quarter mile east and west. Varieties selected bring highest prices on market and are tried Hatch varieties, namely, Drake, I. X. L., Nonpareil, and Ne Plus Ultra. There are avenues of two rows of each variety from north to south in order given. Pollenization-effect governs this distribution and works toward constant and bigger crops.

Production plans of this orchard call for "ton-per-acre" crops. Tree records are kept and the watchword has been "efficiency." One incident of this is the feature of a transposal of Nonpareil and Ne Plus Ultra avenues in every other cycle of rotation, so as to bring the Nonpareil trees adjacent to the Drake row on windward side and one avenue nearer on leeward side (north wind prevails during blooming period). This provision was made due to the theory that the Nonpareil bore greater affinity

to the Texas Prolific, a new variety, which was being watched. In case the future demands it, every other row of Drake could be top-worked to Texas Prolific. It is doubtful if future market will ever demand a change in present lay out. T. C. Tucker, Mgr. Cal. Almond Growers' Exchange, in letter writes: "American people eat with their eyes—a nut in Drake or Texas Prolific class must be large in shell and soft as possible. We cannot recommend the Texas, as we find that as the trees grow older the nuts become hard in shell and smaller in size. To date we have been able to sell Texas at Drake value; but we doubt if this can be done in the future, as trade do not like Texas and we feel sure will not pay the price."

Planting.—Nursery stock was developed from seedlings grown in high land soil similar to present conditions, budded into one-year wood, and top grown one year. These, when transplanted "calipered" approximately $\frac{1}{2}$ inch. Every precaution and known treatment was applied to roots and tops before planting. Work was done by men who had orchards adjoining; and the effort was to make this a prize orchard. To insure long life, bud-wood was set to the south—against the heaviest winds. This setting also serves to shade the seedling scar until it can heal over. All trees injured or lacking in thrift during season were recorded and

replaced second year.

Pruning, next important factor to trees themselves, has been done each year by owners. As in other cultural operations, a scientific principle was strictly adhered to; main limbs were brought out, distributed over second foot of trunk, the lowest limb on southwest side one foot from ground, topmost branch on northeast side two feet from bud. This arrangement gives each main limb independent seating and strong union to support framework of tree; develops a spiral crotch preventing its holding water, so eliminating decay; gives balance and sturdiness against heavy winter winds and rains when less fortunate trees are blown over in soft soil; shades the tender wood from the burning afternoon sun on southwest side. Tendency to develop fruit wood has never been tolerated and by means of careful summer pruning the thrift of each tree has been directed towards the development of a strong well-spread frame, which will now support fruit.

Buildings.—Nothing which lends to the convenience and efficiency of a prosperous home ranch was omitted from original specifications. These

(Continued on page 103.)

Upper—Moseley almond orchard, Pennington, on which the cost records of cultivation, trees, pruning, spraying, etc., have been itemized. Lower—June pruned almond tree at end of second year, in the Burdon and House orchard, Durham.

EDITORIALS

THE WEEK.

ALL believers in law and order and the claims of common humanity will take deep interest in the effort which San Francisco is making to ferret out and bring to justice the perpetrators of the dastardly outrage by which a number of people were murdered and many more grievously wounded, through the explosion of a bomb on the street during the "preparedness parade" on the afternoon of July 22. It was an outbreak of lawlessness, the motive for which has no place in a human heart or in a civilized community. All journals dealing with the general news have brought the details of the affair to universal knowledge, so we need not rehearse them. It is simply for us to join in the general denunciation of the spirit of anarchy which must have impelled the outrage, because those competent to judge assure us that the character of the affair places it beyond the possibility of achievement by a mind diseased. Therefore we have to deal with minds possessed of inhuman impulse and responsible wisdom, and to insist that condign punishment be applied, for the good and the good name of the community. This is the attitude of the people of San Francisco, and every effort will be made to carry out their will. Probably no better reflection of the public spirit could be briefly given than in the words of Supervisor Nelson in a meeting called for action on the outrage:

The murder of innocent women and children is a thing that should arouse us all to united action. If any are suspected I believe they should be apprehended and that all anarchists should be driven out of the community at once. I believe in free speech, but when it comes to talking against our government and advocating murder I believe these people should be driven out of the city. My God, I can't find words to express myself when I think of what has happened!

This is the thought of the people while they still stand confused in the shadow of the outrage. The only consolation which appears at the moment is the assurance, by those wise in ways of criminals, that the dastards will be caught and punished.

A TOWN WHICH LIKES US.

PARADOXICAL as the statement may seem, we are bound to say that this beastly war in Europe, which is blasting humaneness to its foundations, is also developing interest and sympathy between mankind in groups to a warmth and definiteness which are rather new in the world. It seems rational to deplore this as indicating perpetuation of hatred, but it may be regarded by some rather as the seed or cutting from which a truer national love may be propagated for the ultimate reclamation of fellow-feeling throughout the world. However this may be, it is at this moment comforting for us to know that there is a town in Europe which likes California and is picturing its future upon the basis of closer association with us. The town is Bristol, England, and it has a name which suggests alertness, acuteness, and ability in rising up and lying down, against opposition or in recognition of content, as the case may be. This town of Bristol, which is full of antiquity and

honors, is displaying a desire to connect up with the world which would do credit to the most youthful West American aspirant to metropolitanism. For U. S. Consul J. S. Armstrong Jr. writes that Bristol has inaugurated a monthly steamship service with Pacific Coast ports, via the canal, and can effect a saving of from one to two dollars per ton on California produce, to the ten million people within 100 miles of her harbor, on the cost of reaching the same people via Liverpool, London, etc. Good for Bristol! She knows how to do business. Bristol is now enjoying an increased trade in our products, to-wit: alfalfa hay, barley, canned and dried fruits, redwood lumber, etc.—all of which "yearly increase in popularity." And there is another thing which appeals very closely to our affections. Mr. Armstrong says that "public theaters in Bristol use a great many more American films than any other kind, and their hold upon public favor seems to be constantly growing, partly because of the superiority of California for photographic purposes." This seems to be a new measure of the world demand for our photo-play films, and should be a new incentive to California towns which are trying to secure plants for movie-making in their vicinities. Bristol will take our films by steamboat-load in preference to any other. In the words of the admired T. R.: "Bully for Bristol!"

"TRADING WITH THE ENEMY."

AND how much we wish the attitude of bonny Bristol were more broadly British. We can but conclude that the war is getting on the nerves of Johnnie Bull and changing him from a bluff, hearty exponent of fair play and great ideas into a petulant, peevish pervert—with his gaudy waistcoat flapping idly over a cavity where his great heart used to beat so grandly. Interference with passengers and mails on our ships, embargoes on our wholesome food products which his people need, and, more recently, "black lists" of boycotted American firms which are doing fair world-trade which they have a right to do—these are all little, nagging interferences and encroachments on American rights which Mr. Bull should surely wash from the slate before he comes into the great world clearing-house at the close of the war. And then those trade alliances between the nations linked against Germany which are to follow the war—what a silly piece of economic futility they are! What an unfortunate effort to perpetuate the asperities of the war they vainly try to embody! When this fearful quarrel is over, all the people of the world who survive it should naturally rush together in thanksgiving for peace and in honest desire to understand each other so well that the gage of battle will be broken forever. Opposed to such honest reconciliation after a hard fight, which mankind always yearns for, we are threatened with trade alliances which will curdle the milk of human kindness indefinitely. But the good sense of the world, even of those nations which are now so full of hate, will not permit the erection of such monuments of war; and so, perhaps, it is needless to waste much thought upon them.

SOUTH AFRICA MAY GET A LEMON.

BUT though the policy of national discrimination will not prevail long nor widely, it creates ill-feeling and may induce unwarranted anticipations of advantage and of disadvantage. One such item of influence attracts comment because it has citric flavor which naturally fastens on the nostrils of a Californian. There comes floating on the journalistic tide this item:

One of the most remarkable developments in the industrial history of South Africa has been the growth of the fruit industry, and particularly the citrus fruit industry, during the recent years. Indeed, the Union Trades Commissioner has not hesitated since his return from the other side to declare his belief that California will be outrivalled within the next few years and that great fortunes will be made in orange growing.

Now, in ordinary times this would pass as a very commendable piece of local confidence and force in which we might rejoice as new evidence of the development of the citrus industry and the increasing recognition of the wholesome service of semi-tropical regions to the zones of frost and torpid rivers. And, in ordinary times, we could rejoice in

the development of the citrus industry in South Africa, not only on such a world-basis, but also because there are leaders in its development who were Californians, either in experience or education; and toward all such we always cherish warm attachment. But now there arises that ugly phantom of allied trade after the war, coupled with discrimination against enemies and neutrals, and the whole hateful company of trade discriminations and preferences. While we believe it will prove impossible of enforcement because of evident opportunities for retaliation, it will, so long as it may last, perpetuate the spirit of conflict and leave the world crying peace when there is no peace. And while it lasts, too, it may encourage development of citrus production for export in the southern hemisphere on the expectation of special privilege over enemy or neutral enemy-traders, which we believe will never be realized. The citrus industry of South Africa does not need such artificial support, and it will develop more sanely and safely without it if it has a full, and not a restricted, chance at all the northerly nations of Europe. The field of south-hemisphere oranges in the northern hemisphere is naturally limited because the chief shipments will arrive during the summer and autumn abundance of home-grown deciduous fruits. It will take considerable imperial loyalty to induce the English to forsake gooseberries and stewed damsons for citrus fruits at the flush season of the former, and it will be harder still to turn the Canadians from their greater variety of home-grown fruits at that season. And when the northern nations of Europe and America really enjoy citrus fruits they must have them from the Mediterranean or from the vastly greater supply regions of the United States, when these north-hemisphere citrus regions have their fruits just ripe to move. Therefore, we apprehend South Africa is more apt to get a lemon from "allied-trading" than to sell an orange.

CALIFORNIA SEEKS RURAL CREDIT BANK.

IT IS but natural that Californians should make a strong claim for the location for one of the central banks of the rural credit system within this State. According to the new law, to which we have alluded in recent issues, there are twelve of these central land banks to be established in the country. There must surely be one on this Coast, and California is not only central in the Coast district, but is the leader in agricultural development, in population, and is the financial center toward which the transactions as contemplated for such a bank would naturally move. There should also be a central bank for the mountain States of the slope, because the effort to operate mountain land affairs from the Coast or Coast affairs from the inter-mountain plateau, would surely seem an incongruity. We are therefore quite in sympathy with an effort which the California Rural Credits Commission has started for the purpose of securing one of these banks. Professor Elwood Mead, chairman of the commission, says that the body already had urged the California Congressmen and United States Senators to get back of the movement. As the twelve banks are by law to be located and organized by the Federal Loan Board, to be appointed by the President, it is hardly likely that location will be immediately made. Therefore opportunity to present California's claim may be open for some time, for this board must find and organize itself before it makes locations. All our agricultural organizations should make their influence felt in the matter, and fortunately there is time for it.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., July 25, 1916.

Grain Aphis on Sorghums.

To the Editor: I am enclosing a leaf of feterita which is covered with a little green bug which is not only on the feterita but also on Kafr and milo maize. I would like to know the name of the insect and the means of eradication or prevention if any.—G. R. A., Wheatland.

The insect is the old "grain aphis"—aphis avenae. This insect often appears in threatening numbers and sometimes does great injury. Generally, however, it is checked by unfavorable weather conditions or by multiplication of lady birds and other insects which devour it. All which are reached by a soap or tobacco spray are easily killed, but the cost of spraying is usually regarded as too great to be practicable with a grain crop of any kind.

Apricot Pruning and Irrigating.

To the Editor: Please advise me regarding the irrigating of my bearing apricot orchard before or after pruning. I have always pruned them as soon as the crop was harvested and now that I have irrigating water of my own I wish information on this subject. The crop will be harvested in a few days and we will be ready for this work.—Grower, Mountain View.

If you are sure that summer pruning is good for your trees, by all means prune first and irrigate afterwards so that you need not tramp over freshly moistened ground to its injury and your own inconvenience. But you should be sure that your trees are helped to bear by the depression of vigor which such early pruning engenders by robbing the tree of so much of its foliage. Where the tree is not given to too strong wood growth it would be more rational to irrigate after fruit picking, and prune when the season's growth seems well nigh complete—say in September or October.

Root-Rot of Geraniums.

To the Editor: What causes my geraniums to wither and die? They are all cuttings rooted last November. They grew well and bloomed very freely till about June first. Since that time many of the plants have died. The soil is heavy but was well mixed with sand and manured liberally a few months before the plants were transplanted. Would it be safe to start new plants from the best-looking cuttings?—E. H., Merced.

Your geraniums are going off at the root, and the cause is apparently too much manure or water (neither of which is relished in excess by geraniums) or possibly you are working against a rise of alkali—brought up by surface evaporation of excess of water earlier in the season. By all means start new plants from any good top-growth remaining—rooting them in the shade in sandy soil kept only moderately moist.

What Happens During Fruit Ripening?

To the Editor: What reactions occur in pears and plums while ripening after being picked immature for shipment?—F. C. B., Sacramento.

This is a most profound and in the present state of knowledge, an unanswerable question. Beyond the preliminary generalization that starches change to sugar and that certain ethereal substances are developed, there lie areas of chemical and physiological transformation which have never been accurately explored. Excursions have been made into these unexplored areas and some interesting observations recorded in technical literature, but the what, why and how of the phenomena as a whole are still awaiting investigation. Frugivorous promoters and dietarians have had learned dreams which seem reasonable and wholesome and have probably served a good purpose. Their discourses may be philosophy, but they are not science.

The Smaller Potatoes for Seed.

To the Editor: In connection with your comments on size of potatoes for seed I would add that, as I get it, the reason for planting small potatoes for second crop in the interior is that large potatoes will rot if cut and have too many eyes if not cut; so small potatoes are all that is left. This is different from buying small potatoes. I believe small seed under usual conditions is good provided it is grown small purposely by crowding the plants, culture otherwise being as it should be, so that the

small potatoes are from good stock and not naturally runts.—D. J. W., Berkeley.

That is reasonable. Of course in discussing the smaller potatoes for seed we do not refer to the "nuts," which are usually immature, without well developed eyes, etc. Besides, these "nuts" do not have bulk of starch sufficient to strongly start new plants. We should not hesitate to buy the smaller potatoes for seed providing they had bulk enough and are well matured.

Summer Sowing Alfalfa.

To the Editor: I would like to sow alfalfa in about two weeks, if there is a chance to get a good stand. The ground is well prepared and I have plenty of water to irrigate with. Will you please advise me as to sowing alfalfa this time of the year or not? Neighbors who have been seeding lately claim that birds eat it as fast as it comes up. L. V., Chowchilla.

Where you have plenty of water and a soil which will take it without baking hard, it seems to be possible to get a good summer catch of alfalfa by sowing it under a shade crop. Frank Hasper of Imperial county (Pacific Rural Press April 8) did well by sowing milo, harrowing in the seed. When it was well up and needed irrigation he sowed alfalfa and then irrigated and the seed caught well. This is only practicable with enough water; otherwise the sorghum will dry out the alfalfa even if it should start, which would be doubtful. Perhaps the sorghum will keep the birds busy. But we do not advise this course. We would rather sow cow peas for forage and put in the alfalfa after plowing in what is left of the peas in October.

Sowing Millet and Alfalfa.

To the Editor: I wish to sow barley or oats with alfalfa so I can get some hay, but I fear that these grains will not grow if sown now. Can I get good results by sowing millet with the alfalfa? Will it hurt the alfalfa?—F. R. T., Oakdale.

There will probably not be any alfalfa to be hurt unless you fill up the ground with water before plowing and use more later as it may be needed. If you have the water your question becomes much like that of L. V. of Chowchilla above. Possibly you could work millet instead of the milo, but you must not seed very heavily or else you may get plenty of millet and not enough alfalfa to notice. Our present knowledge does not approve these midsummer catches for alfalfa. To get a good stand, alfalfa should have all the light and air it needs and be started at a time when it will not perish from thirst or be burned out with water standing on it. As we have told L. V., we had rather try and make a good summer crop for hay or forage and give the alfalfa an early fall or an early spring start and make a business of getting a good stand, not a scant catch.

Leaf Chafers in Orchard and Garden.

To the Editor: I send you specimens of a fat brown bug a little larger than a lady bug, known here as a "June bug" because it comes in June. It buries itself during the day and at night feeds on the leaves of plums, apricots, and rose leaves. Do you know something to exterminate them?—G. T., Lankershim.

The insects are not the big "June bugs" of the east but they belong to the same bunch and act in the same way. They belong to the genus *Serica*. The larvae feed on plant roots and the perfect insects feed on foliage, etc., as you have observed. Though the insects come in great numbers and do much damage they do not stay long. As they are leaf eaters, they can be poisoned by spraying the foliage with lead arsenate and if this is done as soon as they are first seen, their injury can be reduced.

Drawing "Sweetness" from the Soil.

To the Editor: Is it true that the raisin grape, fig and prune draw sweetness from the soil and therefore one should not plant sugar beets between the trees and vines because they will take away from the fruits the sweetness which they also need? I know of a farmer who planted raisin grapes between his fig trees and when the trees came into bearing the figs were not so large nor were there so many of them as on the trees of the same kind and age, of a neighbor who had no vines

between the rows to draw the ingredients from the ground that the figs needed. When the first farmer dug out his vines the fig trees did much better because there were no grapes to rob the figs of the sweetening properties of the soil.—R., Fresno.

There is nothing in the soil which directly enters into the formation of sugar in the plant except the water. Starch and sugar are produced in the plant tissue by the combination of the water, which the plant draws from the soil, with the carbonic acid which enters through the leaves from the air. As plants do not get sugar directly from the soil, it cannot reasonably be said that they can rob each other of sweetness in the soil because there isn't any in it.

Of course it may be said that they indirectly rob each other of sweetness because if they rob each other of anything which makes thrift in the plant, it cannot make sugar or anything else which renders its growth profitable. This however is, evidently, not what our correspondent has in mind, for he has a conception that the soil has a definite quantity of sugar-properties in it and gives the plant directly what is required to produce sugar. From only one point of view is this correct and that is in placing emphasis on the water which is drawn from the soil. This not only enters into the production of sugar but is the controlling requisite in the thrift of the plant, without which it cannot make sugar or anything else. A sufficient water supply is therefore essential to the achievement of size, weight, sweetness, fragrance and everything else which makes a plant worth growing. And it does this not only by supplying its own substance but because it carries into the plant all other substances which the soil contributes to its growth. But sweetness is not one of these substances: the plant makes its own sweetness with water, sunlight and atmospheric gases.

The reason why the raisin grapes and figs did not do well together in the case cited was because the former robbed the latter of water, and the nitrogen, phosphoric acid, potash, etc., which it could carry. Of these carried substances none are found in sugar. And the vines also robbed the trees by preventing proper cultivation, through which more water was lost. These two forms of robbery reduced the thrift of the fig trees, produced the results described, and removing the robbers set the trees free to do better. These robbers stole no sugar but they got away with the "makin's" of it.

Apricots and Plum on Almond.

To the Editor: I have almond seedlings which I wish to bud to apricots and plums. Some say apricots do not do well on the almond: some say they do. I grafted a few on almond this spring and they have done well but I fear they may not be found satisfactory later. How do plums do on almond root?—Y. S., Winters.

It is common experience that the apricot is most likely to refuse good union with almond—trees blowing off at the joint after getting large. We consider apricot unsafe on the almond and, so far as we know, experienced propagators abandoned the use of almond. The French prune and its near relatives do exceptionally well. In our experience a number of the Japanese plums have stood it well, but many plums are very finicky and it is safer to work them all on myrobalan on which they seem to agree. Besides, most people wish to grow plums on soils which do not well suit the almond root.

Federal Tuberculosis Quarantine.

The Federal Government placed a tuberculosis quarantine on five Illinois counties Oct. 1, 1914, in co-operation with the State Livestock Sanitary Commission. Men in the five counties had been buying tuberculous cattle and shipping them to other States until several of the latter quarantined against all cattle from Illinois not accompanied by certificate of freedom from tuberculosis. The Federal quarantine is to be withdrawn Aug. 1, the State having passed a law to control the situation. The quarantine required that all dairy cattle shipped out be non-reactors tested by U. S. officials.

Citrus Spraying Symposium.

[Written for Pacific Rural Press.]

Chas. F. Collins, Tulare county horticultural commissioner, May 24. —In your issue of the 20th inst. under head of "Citrus Spraying Advantages" was a purported interview with F. H. Browning of Orange county which interested me greatly owing to the fact that my experience differs so widely from that of Mr. Browning.

According to his statement he secured a kill of only 10 per cent with fumigation, while with two sprayings he got a percentage 85 or 90.

Fumigation with hydrocyanic acid gas for scale on citrus trees has been practiced so successfully for so many years that anyone who knows anything about the game knows that a 10 per cent kill means inefficiency either in the material or operator, and not in the method. In the 3500 acres fumigated in Tulare county, all of which was carefully inspected, not one job fell as low as 85 per cent and, with three or four exceptions, even as low as 95 per cent. In fact a very large proportion of the work showed better than 99 per cent kill and we do not feel satisfied with any work that falls below 98 per cent, as we believe that work inferior to this is usually due to carelessness or ignorance on the part of the operator. Of course such results as above cannot be obtained without careful and painstaking attention to details which any grower has a right to demand and any conscientious fumigator will readily grant.

The sprays which have been tried out here include the various miscible oils, different forms of distillate and kerosene emulsions, Scalercide, Schnarr's Insecticide, Gold Dust, Pyrox, Shure-Kil, and various other compounds, some of which were of local manufacture and not burdened with a patent name, but all of which proved disappointing, and in many cases disastrous to the growers.

The spray which is said to have produced such wonderful results for Mr. Browning has resulted in unreasonable and inexcusable damage here. The agent claims it was applied at the wrong season, although still advertising it to "destroy all scale living or unhatched at any time of the year and not burn the fruit or trees." This statement is so palpably misleading and preposterous on the face of it to anyone with even a smattering of knowledge regarding scale control on citrus trees that it is not worthy of attention. It is further advertised as being "50 per cent cheaper and 50 per cent more efficient than fumigation." As evidence of the falsity of this statement, we have orchards here sprayed once at a cost to the owner of over 37c per tree which any reliable fumigator would do for 35c. Furthermore the kill of scale is about 60 per cent, while the present crop is ruined and the trees damaged to such an extent that it will require two years to recover.

The one insurmountable barrier to successful spray work on citrus trees with any formula is the fact that it is a physical impossibility to hit a reasonable per cent of the insects without using material in such quantities as to make the cost pro-

hibitive. Of all the demonstrations of spraying for citrus scale in this county, and they have been many, none have proved of any advantage over fumigation, but decidedly to the contrary when expense and efficiency are both considered.

Editorial Note.—That was a real interview with Mr. Browning by the writer, who walked through the orchard and examined the trees for at least two hours one day this spring, along with Mr. Browning. We do not doubt the facts as stated in any respect.

It is quite likely true that the poor kill from Mr. Browning's fumigation was due to inefficiency. Likewise, we believe that the poor kill in the usual spraying is also due to inefficiency of the workmen, provided the spray is such as will kill the insects without injuring the trees.

Before the writer investigated any of the dozen sprayed orchards which he visited, the Shure-Kil people told us that during a short period they had used second-hand oil barrels at their factory, and that it had come to their notice that these barrels had not been thoroughly cleaned before using for the spray. When this was learned, they immediately sent notices to all their customers advising them to return all spray which showed free oil on top, and promising to replace it with the regular spray. This may have been the cause of the damage by this spray in the Tulare county orchards, for we have seen many orchards in the South on which the spray had been used and in which we do not believe that either the fruit or the trees had been damaged by the spray.

Some of the small branches and twigs indeed were dead. These showed unmistakably where they had been plastered thickly with scale which had dropped off before we saw them. In many other cases, the branches were still thickly plastered with scale, practically all dead.

Our publisher says he will certainly cancel our citrus spray ads if it is shown that the best interests of our readers will be hurt by their using the spray. Our talks with the growers, however, convince us that citrus spraying is practicable and efficient when administered as painstakingly as Tulare county fumigation has been—with several advantages, as mentioned in the article.

Dr. R. E. Pierce, Tulare county:—I am as yet in no position to say anything definite about citrus spraying. The effects of Shure-Kil as seen by me are anything but satisfactory. Although it kills the scale, it also defoliates the trees and drops the fruit. Other sprays, while efficacious in kill, spot the fruit. I believe the present season will produce a much more satisfactory spray than has yet been used. Until more definite conclusions can be arrived at, fumigation, while by no means entirely satisfactory, is the chief method of scale control that will be used here during the coming season.

[At Dr. Pierce's request, we withheld from publication data which he gave us in Sept., 1915, regarding his orchard of which 13 acres were sprayed and 14 fumigated in that

season. He wanted more time to estimate the relative kill.]

G. B. Moore, Tulare county:—Some of my 15-year Navel trees were sprayed late in March with a 20 per cent mixture of Shure-Kil under the spray people's supervision and at 250 pounds pressure. They had never been fumigated and quite a number were black on one side with scale. The trees seemed healthy and bore a good crop in 1915 but naturally had no fruit on when sprayed.

Leaves and young growth fell after the spraying, and they look bad with brown stems showing. The costs of spraying and fumigation would be about equal. I can't say that spraying is a failure. But I do condemn this spray mixture at this percentage. It may not require 20 per cent to kill scale, but I know from sad experience that it is too much for the tree.

Allen Break, San Bernardino county:—I sprayed two navel trees late in May. They were 20 years old and I used 9 gallons per tree under the spray people's supervision. The trees had been fumigated with a 75 per cent kill in 1912; but were healthy and not badly infested when sprayed. About half of the leaves fell, some of the young wood was burnt, and fruit dropped badly. Within 48 hours after spraying, citricola scale were loosening up and eggs decaying. My fumigation cost about 60 cents, and spraying about 27 cents when hired done.

Shure-Kil Spray Co., May 26:—All told, we believe, not two acres have been sprayed with S-K 23 in Tulare county. About 100 trees in the Lindsay orchard of Col. Rees, who lives at Whittier, were sprayed by sprayers who had never done that class of work before; and as is usual in such cases, unfortunately they wanted to do too good a job and overdid it by putting on too large a dose. It was reported to Mr. Rees that the sprayers stopped of their own volition when they saw too many leaves dropping. Mr. Rees being a Whittier grower, where perhaps 100 orchards have been sprayed, knows all about S-K, and wasn't concerned about the damage reported,

but thought it might be best to wait until a little later in the season.

We have made perhaps two dozen demonstrations in various parts of Tulare county, ranging from two to three trees in an orchard. Some of these have shown a rather heavy dropping of leaves, but this also happened in other parts of California at that particular time, but since that time we have found that the water conditions there are entirely different from what they are here, and a different treatment will have to be used in order to obtain good results, the water being so hard it doesn't mix properly with our emulsion. Our chemist has already overcome this difficulty.

ALMOND LEAVES FALLING.

To the Editor: My almond leaves are turning yellow and falling.—H. I. E., Walnut Creek.

[They probably have brown mites or red spiders. Look very closely along the midrib on the underside of a leaf that remains on a twig from which a few have fallen. Run a finger nail along the rib lightly so as not to crush the bugs and you will see them scampering. Get a power blower for dry sulphur and save what you can by spraying thoroughly every two or three weeks. Or spray under sides of leaves with atomic sulphur. Do it earlier next season, as the mites and spiders are more easily killed when young.]

NEW PEAR VARIETY.

[Written for Pacific Rural Press.]

A pear that ripens three weeks later than the Bartlett but looks like that variety, has practically the same quality, and has been held in storage six months with good results, is grown commercially in Australia under the name of Peckham's Triumph. When Hayward Reed of Sacramento county visited Australia last summer he became interested and now has on the way a shipment of trees to plant on his Marysville ranch, according to A. E. Ollson, who has come over from Australia to learn California methods under Mr. Reed's direction.

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

AUGUST 1ST

To all SANDUSKY owners, and prospective buyers—we announce the removal of our office and salesroom on **AUGUST 1ST**—to

126 NORTH LOS ANGELES STREET

Our new location will make it possible to better serve the tractor buying public—our customers. Come in and see us and **THE SANDUSKY**. We want to show, and explain to you, what we believe is the most wonderful tractor on the market today.

"POWER ON THE FARM" BOOK—FREE

A 40-page book describes the distinctive design, high grade construction and exceptional ability of this machine. It also sets forth our binding guarantee and offer of three days' trial on your farm. A copy will be mailed you on request.

New Method for Canning Vegetables

[Written for Pacific Rural Press by Prof. W. V. Cruess, Univ. of Calif.]

All of the present methods for the home canning of vegetables either require a somewhat expensive outfit or are very troublesome to apply. Vegetables are difficult to sterilize because of two factors: first, they contain bacteria which are difficult to kill by heat; and second, they are deficient in acid-which makes it difficult to kill the bacteria by heat. Tomatoes and rhubarb are exceptions to the above rules. The spoiling of vegetables after canning is always due to these resistant bacteria which grow in the canned article and cause it to sour or burst the can or jar from the formation of gas. The processes of canning are carried out principally to kill the bacteria causing spoilage.

It is a well-known fact that various acid vegetables such as tomatoes and rhubarb are very easily sterilized at the boiling temperature. This is because they have a high amount of acid. The acid makes the killing effect of the heat very much more pronounced. These facts suggested the addition of some acid to vegetables before sterilizing in order to reduce the time of sterilization and to avoid the use of expensive steam pressure outfits. The experiments made with the application of this principle have been very successful and the methods outlined below are based on the results of the tests.

By ordinary methods, vegetables must be sterilized under steam pressure or must be sterilized at the boiling point of water for one hour on each of three successive days or in one single continuous sterilization at the boiling point for three hours. By the application of the new method, vegetables may be successfully sterilized in one hour or less at the boiling point.

Equipment Necessary.—An ordinary wash boiler with a false bottom made of wood or of wire screen is all that is needed for a sterilizer. An ordinary cook stove may be used for heating the water in the sterilizer. In addition to this a gallon or quart measure should be available and also a small measuring cup or glass which will measure the ounces, will be necessary. If the vegetables are to be put up in cans, a capping steel, tipping steel, and a gasoline blow torch for heating the soldering irons will be needed. Names of the manufacturers of these articles can be obtained on application to the University. The capping and tipping outfit necessary for these may be had for about ten dollars or less.

Source of Acid.—Lemon juice has been found to be very satisfactory as a source of acid in the canning of vegetables. Its known purity and wholesomeness make it a very desirable material for this purpose. Its cheapness and availability are also recommendations. Vinegar could also be used.

Peas.—The method applies to practically all vegetables and if rather complete directions are given for one vegetable, the process can be extended to others.

Step One: Shell the peas in the ordinary manner.

Step Two: Place the peas in a clean flour sack or in a cheesecloth

bag and immerse them in boiling water until they have softened and begun to wrinkle slightly. This is known as blanching the peas and removes the bitter principle from the skin. This will take from one to ten minutes.

Step Three: Fill hot into jars or cans.

Step Four: Prepare a syrup consisting of salt, 2 ounces; sugar, 8 ounces; and water, one gallon. Heat this syrup to boiling and pour the hot syrup into the cans or jars to cover the peas.

Step Five: Seal the cans with the soldering iron according to directions given with these articles by the manufacturer. If jars are used, seal them in the ordinary way.

Step Six: If cans are used, place them in the wash boiler of boiling water and leave them for one hour. Allow them to cool to room temperature. If jars are used, place the sealed jars in water which is just a little too hot to permit holding the hand in it. If the water is too hot or too cold, it will cause breakage. The false bottom under the jars is necessary to prevent breakage by direct heat from the fire. Bring the water to boiling and boil for one hour. Remove the jars and allow them to cool in a quiet place free from draughts.

Peas or other vegetables canned in this way often have a rather "raw taste, but will keep indefinitely. They may, however, be given further cooking after the can is opened. This is desirable because the flavor of the vegetables is better if the cooking is carried out after canning rather than during canning.

String Beans.—The process for string beans is exactly the same as for peas except that the brine used consists of salt, 3 ounces; lemon juice, 5 ounces; and water, one gallon.

Corn.—The brine for corn should consist of salt, 2 ounces; sugar, 4 ounces; and lemon juice, 8 ounces; water, one gallon.

Asparagus, Artichokes, Carrots, Parsnips, Turnips, etc.—These take the same brine as string beans and same process otherwise as peas.

Tomatoes.—The addition of lemon juice is not necessary with tomatoes and they are simply canned in their own juice because it contains sufficient acid for the purpose.

All the vegetables canned by this method have a slight but not disagreeable acid taste. The quality of the products is very good and the method should be very popular for the home production of canned vegetables for table use. The commercial possibilities of the process do not seem exceedingly promising because all of the commercial canneries have already installed machinery which will carry out the sterilizing processes satisfactorily and therefore there would be no demand for the use of lemon juice in this regard.

FORCES GROWTH OF STOCKS FOR WALNUT BUDDING.

[Written for Pacific Rural Press.]

A system of forcing walnut stocks to greater growth at the time of

budding, insures a better union and better growth of scions for J. F. Kennedy of Paicines. We give his method in his own words:

"We prepare the buds by cutting off the leaf-stalks as soon as the buds are well developed. Give the trees to be budded, plenty of water in August, and keep the stocks growing rapidly. In the latter end of Sept. begin your budding, on cool days only. Choose the smooth buds, cut as little wood as possible with the bud; leave a little wood just beneath the bud, take out any other without injury to the bud; insert the bud from the bottom upward as in shield-budding; tie as in common method."

PRUNE AND APRICOT ORGANIZERS BUSY.

[Written for Pacific Rural Press.]

Prune and apricot growers are signing stock and crop contracts rapidly in Santa Clara valley; a recent enthusiastic meeting at Napa called forth a large per cent of all the growers, and the work will soon be under way in the other districts interested. Twenty-one growers signed up at the meeting of the Cambrian school district July 15. Merchants and growers provided an elaborate meeting at Gilroy July 24. About a dozen such meetings have been held, and others are scheduled at the rate of three or four per week.

System.—In Santa Clara county

are about fifty school districts in which prune and apricot growing are the main interests. Eight or ten of these districts are grouped into each of several units. A solicitor for each unit is paid by the State Central Organization Committee. He arranges the meeting in each school district at which the plans and purposes of the organization are explained. A vote is then taken, favoring organization, and then the solicitor visits every grower in the district.

Funds.—There is considerable expense. The merchants of San Jose have endorsed the organization and undertaken to raise from Santa Clara county business men an organization fund of \$10,000. This is a donation to the cause; but it is proposed, if growers do not take all of the stock and outsiders must be included, to award \$10,000 worth of stock to the donors of this fund.

Meanwhile, growers who sign up their crops are asked to advance 50 cents an acre, more or less, according to their ability, to apply on their stock payments, but to be used now to further the organization. If Santa Clara growers advance enough this way, the merchants' fund of \$10,000 will carry the campaign into other parts of the State.

Emphasis is laid on the desirability of bona fide growers owning and controlling all the stock of the organization, and if they will sign for it, outsiders will not be asked to take stock.

"Know Your Soil"

There's No Excuse For Raising Poor Crops Now

SUCCESSFUL crops can be grown with scientific accuracy by determining the exact condition of the soil and applying the fertilizers needed and in proper amount. You don't need to have an expensive analysis made of your soil. You can do it YOURSELF in a few minutes at a cost of a cent or less by using the

Standard Soil Tester

It will tell you whether your soil is fertile or not; whether the whole tract, every single acre and every part of each acre is in fertile condition or not; it tells you what your soil needs, and saves waste of needless fertilization; it tells you whether your soil is RIGHT or not.

The cost of the Standard Soil Tester is small compared with the increased profits and every rancher should have one. It will save its cost the first week.

Prune Drying Wrinkles.

Care in drying, and quality of dried prunes, will count far more in prices to the grower in the future than in the past.

[Written for Pacific Rural Press.]

It hasn't made much difference whether you had good prunes or poor ones if they were big, and even then you haven't had the full benefit of the size, because the packers have a way of juggling sizes.

You have been unconcerned about increasing consumption because it was not up to you, and the packer you sold to was unable to do it.

Soon you will be called upon to market your own prunes in your own organization, which should require you to furnish only the best quality so they won't waste your money when they advertise to increase consumption. You will have to put up prunes that you yourself would be able to eat.

You will smooth the ground before the first fruit falls, you will pick up the sunburned, wormy, or injured stuff on the ground and throw it away to save the trouble of dipping and drying and then picking it off the trays or leaving it in to damage your market.

You will pick up the prunes every week over the whole orchard if the weather is hot, to prevent sunburn or fermentation. You will change your lye water when it gets dirty, and you will wash the lye water off with a clean spray.

You will not have the lye so strong nor leave the fruit in it so long that the skins will be more than just perceptibly checked.

Too Much Lye Harmful.—When you overcheck the skins they may become ragged and sticky. According to G. A. Fleming of Visalia, who has been in the prune game since it started in Cal., if you dip them very quickly in boiling water with just enough lye to soften the water and take off the waxy bloom without cracked the skin, it may take a day or two longer to dry them, but they will have the black and glossy appearance desired by the trade.

Steam to Heat the Lye.—F. R. Shafter who lives near San Jose has been drying prunes for 30 years. He says that with a wood fire to heat the lye water, you can't keep it poiling if you dip two boxes per minute. Also, if you quit dipping 1½ minutes to do something else, your kettle boils over. It is 20 years since he used the wood furnace under his kettles with wood fires, by letting has burnt out two or three prune dip kettles with wood fires, by letting them get dry while making lime-sulphur spray.

For about 20 years, according to Mr. Shafter, he has been using steam to heat the water. He averages 3 boxes per minute and 4 in a rush; but the water keeps boiling. Live steam may be turned into the water through a perforated pipe on the bottom of the kettle along its front side. Steam-tight pipe coils line the sides of the kettle, and the exhaust from the steam engine opens into the kettle. Not all of these sources of steam are used at once. The engine is used to run the graders.

How Much Lye.—Mr. Shafter watches the trays, and when he can't see checked skins, he adds more lye. This is better than any system of measurement, because lye strong

enough to cut one lot will take the skins off from another and this is sometimes true of prunes from the same orchard. Imperials are so tender that he uses sal soda instead of lye for them.

Rinses with Hot Spray.—Many people do not rinse the prunes at all after dipping. Many dump them into another basket in another kettle of cleaner water, as Mr. Shafter used to. But "when the rinse water gets dirty and is not changed, what good is the rinsing?" A half hour's dipping makes the lye water muddy with dirt and honey dew.

Four orchard spray nozzles now shoot clean water onto the dipped prunes as they come out of the hopper into which they are dumped from the lye water. The hopper lets them roll one-deep over needles and onto the grader. Steam is commonly turned into the pipe leading water to the spray nozzles, to heat it so the prunes will not be cooled off. This is important after the sun becomes warm, because the prunes are warm already and can commence drying at once without wasting time to warm up. It makes no difference in early morning.

Grading and Drying.—From the spray and the needles, the prunes run over a shaking grader which sep-

arates them into three sizes so they will dry more evenly on each tray.

E. N. Richmond of San Jose recommends drying three-quarters in the sun, during which time they are turned over by shaking the trays or with a broom. This dries the fruit evenly all through, shortens the time on the trays, and makes a finer grade of fruit.

Stack the trays of ¾-dried fruit either in ricks or with ends alternately six inches beyond the one below, and with ends toward the prevailing wind so they can finish drying slowly, and the moisture which remains may be evenly distributed throughout each prune.

Grading for size before selling makes another story.

An article which changes old established methods makes enemies—but Progress acts like a steam-roller.

YOU WANT A CLEAN ORCHARD.

Scales, Mealy Bugs and Red Spiders have become a greater menace than ever. Citri-cola are sweeping over the State. The old remedies are unable to control the pests. S-K 23 will destroy all kinds of Scales in all stages of development whether breathing or in the egg state. It kills Mealy Bugs almost instantly.

YOU WANT TO SAVE MONEY.

S-K 23 saves 35-60% over fumigation expenses, depending on whether growers do their own spraying or have it done. The larger saving is made where Red Spiders and Scales are destroyed at one application.

Don't wait until all your neighbors clean up their orchards with S-K 23. Be in the front rank yourself.

S-K 23 will not burn fruit or trees when properly applied. Take no one's word for or against S-K 23.

MAKE US SHOW YOU.

Costs of Three-Year Almond Orchard.

(Continued on page 97.)

have been carried out to extent that the two buildings in the home site, laid out along principles of American landscape gardening, are completed; the smaller serves as office, library, and laboratory where brain work is possible without interruption; the larger is a two-story structure designed to furnish sunshine, air, and sound sleep in upper part both summer and winter. In rainy weather one needs but descend to ground floor where is furnished a serviceable machine shop, power-driven with over-head shafting, and several belt-driven tools. Here is installed a Perry pneumatic water system delivering water to shower bath, sinks, and lawn faucets, from one of the best underground water-flows from the Buttes. A bored well, cased, opens into a 10-foot concreted pit of 5x8 feet floor dimensions. Ordinarily the pit is covered with 2-inch flooring, having a troughed concrete beltway provided, should it be desired to run the centrifugal pump as auxiliary to the Perry system. This latter system furnishes compressed air (separate from water) for portable tools, forge, inflating tires, or for cleaning tractor and implements. Hot water is stored in a 30-gallon boiler by an ingenious arrangement, effective whenever the power plant is running.

Incompleted plans call for direct current electric lighting system for buildings and grounds, the generator of same to be belted from the jack-shaft in machine shop. Further plans call for additional shed-room for harvesting equipment, and to serve as work building during rainy weather. This construction comes under future appropriation from crop returns and is to be erected on ground reserved apart from home site. It is planned to install a 40,000 gallon concrete reservoir half under ground, for immediate purposes of swimming pool, but arranged to be connected to a future concrete underground irrigation system. Drainage of reservoir, pits, grounds, and sewerage is obtained through a sizeable creek which heads in the Buttes and passes within a few rods of buildings.

YEARLY TREE COSTS.			
ITEM	1st yr.	2nd yr.	3rd yr.
Nursery cost	\$ 643.26	\$ 66.45	\$ 25.00
Hauling and heeling	21.14	12.08	...
Planting & preparing	187.24	27.18	15.10
Plowing	80.00	87.50	73.75
Tooth harrow	10.35	47.00	19.50
Disk harrow	27.50	40.00	51.50
Weeder	17.25	12.50	46.00
Hoe	37.00	42.75	10.90
Pruning	...	42.00	56.00
Watering	78.25	20.50	...
Spraying & treatment	12.00	15.00	42.28
Supervision	148.61	142.50	125.00
Total tree cost...	\$1262.60	\$ 555.46	\$ 465.03
Improvements	1254.00	300.00	788.00
Cost raw land	4000.00
Total Expense...	\$6516.60	\$7,372.06	\$8625.09

NOTES:—Cost per tree (dividing yearly total by 5020, but not including land or "improvements") equals \$.418 the first year, \$.183 the second year, and \$.154 the third year. Total cost per tree at end of third year equals \$.758, not including cost of land, implements, or improvements. Assuming tree cost 4th and 5th years at \$.25 per year brings tree cost to \$1.258 each at end of 5th year. This equals \$94.35 per acre. Original estimate, \$100 per acre to bring trees to bearing in 5 years. Initial land value \$100 per acre.

Briefly it may be interesting to add that a curve of average yearly returns was plotted from data collected, and from the many growers interviewed. Two orchards in particu-

lar are of interest, one small orchard of 1400 trees whose third year wood produced an average of 1.4 pounds per tree—over \$10 an acre, which was sufficient to cover operating expenses; another orchard of some few hundred old trees (believed to be 40 years) one of which produced 400 pounds, which were that year worth 20c per lb.

The Buttes Almond Orchard rests on the eve of proving itself a properly fostered "eugenic result." It will this coming season produce the fruit-wood for its four-year-old crop. Detailed operating costs for past three years warrant the following assumed future totals; cultivation, consisting of fall and summer (light cross) plowing, twice over with double disc harrow, four times over with tooth-harrow—\$4.25 per acre; spraying—power spraying once in every summer for red spider—\$2 per acre; pruning and burning brush in orchard on portable incinerator, \$5 per acre. Cultivation is done with Yuba "18" Ball Tread Tractor, which is credited \$20 daily in making up above costs, so that true cost of cultivation is 1/2 of figure given. In pruning, owners' time is charged at 50c an hour, so figure given is higher than common costs—also it covers 15 per cent more trees. I will discuss further any point or answer any question, which may arise in reader's mind.

DISPOSING OF MANURE.

To the Editor: I want to build a barn this fall for six horses and six cows. What is the cheapest and easiest way to dispose of the manure?—T. N., Walsh Station.

[The most economical way to remove manure from the barn is by litter carrier, run either on overhead tracks made especially for that purpose or on stout wire cables.

These tracks or cables run lengthwise of the barn, being hung from the rafters so the carrier will run back of the gutter. From the barn the track is extended into the corral, supported by heavy posts, high enough to allow the carrier to be dumped directly into the manure spreader or wagon when desired.

Of course the first cost of this carrier system will be greater than a wheel-barrow, which would answer the same purpose, but the carrier system is easier and more economical in the long run.—Editors.]

IRRIGATES ALFALFA TWICE.

To the Editor: A neighbor advises me that I am watering my alfalfa too much in flooding it twice a cutting—says it won't have the feeding quality for cows that hay would have with one watering. Our soil is a coarse sand 16 feet to water level. When flooded with six inches of water, will soak in within an hour. By watering twice per cutting we get more hay, and it grows much faster.—E. J. W., Ripon.

[Go ahead with your double irrigation. You will be riding an automobile before your neighbor if you have an equal start. Your alfalfa needs the water frequently, though not more than enough to soak down as far as the roots go. Its feeding value will be increased.]

At the touch of a match

All the conveniences of gas—better cooking and a cleaner cooler kitchen

NEW PERFECTION OIL COOK-STOVE

For Best Results Use Pearl Oil

Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate. Your cooking is better, too, because you have heat-control like a gas stove.

The New Perfection gives a clean, odorless, sootless flame because of the long blue chimneys. Cuts out the drudgery of wood or coal. Keeps your kitchen cool. In 1, 2, 3 and 4-burner sizes, ovens separate. Also cabinet models with Fireless Cooking Ovens. Ask your dealer today. Standard Oil Co. (California)

Mechanical Power on the Farm.

CATTLE FOLLOW BIG HAR- VESTER.

[Written for Pacific Rural Press.]

Chas. Rieck of Tulare and Kern counties harvested 13,000 sacks of wheat in about two weeks and had 250 cattle feeding on the stubble before June 20 this year. A caterpillar pulled what Mr. Rieck thinks is the largest combined harvester in the world. It cuts 38 feet at a swath and threshes 100 acres a day. After his own grain is safe and the cattle are feeding, the machine works for neighbors enough to pay Mr. Rieck's cost of harvesting.

Lieut. Bryan, U.S.N. stated before the Am.Soc. of Naval Engineers: "Oils made from the asphalt-base crudes have shown themselves to be much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils."

Zerolene is scientifically refined from selected California crude—asphalt-base. Highest competitive awards, San Francisco and San Diego Expositions. For sale by dealers everywhere and at service stations and agencies of the Standard Oil Company.

The tractor is hitched to a string of wagons and hauls 650 sacks per day to the Orris warehouse.

The wheat was grown on summer fallowed land, yielding 9 sacks per acre of plump smut-free grain.

CHEAPER, BETTER PLOWING.

[Written for Pacific Rural Press.]

The good work of a C. L. Best tractor and the expenses of operation are reported by J. R. Huntoon, manager of the Dozier & Pressley Co. ranch near Windsor, Sonoma county. He plowed 166 acres in 15 days and cultivated 175 acres in 10 days. He figures:

25 days, drivers' wages @ \$2	\$ 50.00
Distillate, 540 gallons @ 8c	43.20
Oil and grease	25.00
One track roller replaced ...	3.85
Four grease cups80

Total, not including interest

or depreciation\$122.85

That is some cheap plowing and cultivation; Mr. Huntoon asks the question, "Does the tractor pay?" and answers, "I sure can do better work with it."

GAS ENGINE ELECTRICITY.

[Written for Pacific Rural Press.]

An eastern farmer writes of his 2 h.p. gas-engine-dynamo home electric light and power outfit. The outfit is in the washroom built against the house. The engine runs the washing machine and the 30 volt dynamo at the same time. The dynamo charges a battery of 27 cells in the cellar, each charge being enough to supply a lamp 60 hours.

He has 18 lamps in the house and cellar, and five at the barn. Wiring and fixtures cost \$125. The whole outfit including the engine cost \$425, and there was no trouble learning to operate it. He and his wife hope to use electric fans, flat iron, sewing machine motor, electric toaster, electric vacuum cleaner, etc., in due season; and there is no reason why the engine shouldn't do the pumping while it rests.

BALING ALFALFA FROM SHOCK.

To the Editor: Under what conditions can alfalfa be baled out of the shock? I have been told that it should be stacked and allowed to go through a sweat first.—Sub., Waukena.

[An article in our issue of Apr. 22, tells how Woodward and Sons of Perris bale hay with a power baler one afternoon, which was cut early the preceding afternoon. They sometimes store their hay two years and always sell at better than average prices. The unusual practice elsewhere is to let it sweat in stack, but we see no reason for not baling from the shock after the alfalfa is cured entirely through the stems.]

ONE PUMP FOR FIVE WELLS.

[Written for Pacific Rural Press.]

It quite frequently happens that farmers depending upon pumping plants for irrigation have more than one well to pump in order to supply all of their land with water.

Such is the case with A. Haley of Alameda county, who irrigates the alfalfa for his dairy from five different wells, using portable pipe for water distribution.

Instead of having money invested in five pumps, as would usually re-

LAYNE & BOWLER PUMPS

IRRIGATE
THE WORLD

THESE PUMPS PRODUCE MORE WATER THAN ANY OTHER STYLE. THAT'S WHY WE HAVE THE REPUTATION OF BEING THE "WORLD'S LARGEST WATER DEVELOPERS."

OVER 5000 IN SUCCESSFUL OPERATION.

Layne & Bowler Pumps are installed in all parts of the world. Different localities and conditions do not affect them. These Pumps are in operation in nearly every State in the Union, and in Mexico,

Canada, Japan, Jamaica, Philippines, Formosa, West Indies, Russia and other countries. The sun never sets on Layne & Bowler Pumps.

BAROLD SOMERS, 150 DeKalb Avenue, Brooklyn, N. Y.

sult under such a condition, Mr. Haley has but one six-inch centrifugal pump and an electric motor, which do all of the pumping at the widely separated wells.

This is made possible by having both the motor and pump in a wooden frame hung between two heavy steel girders, fastened to the front and back axles of a four-wheeled truck.

The frame hangs from the end of a cable that runs from a hand-operated drum at the rear of the truck up over a pulley which is supported by two perpendicular steel girders, thus giving the motor and pump very much the same appearance as an elevator as seen in buildings.

To operate the pump, the truck is hauled to a point directly over the well pit, which has to be about four feet wide and six feet long to accommodate both pump and motor. After setting, both pump and motor are lowered to the bottom of the pit with the steel cable, the former being connected to the well and a discharge pipe and the latter to the electric line.

As the water is high enough in some wells on the place so that no pit is required, provision has been made to run the pump while resting on the truck in such instances.

Thus it will be seen that the outfit is not only portable for moving from one well to another, but also accommodates all wells despite difference in depth of pit.

PUMPS LIQUID MANURE FROM PIT.

[Written for Pacific Rural Press.]

Disposal of manure on dairies is seldom satisfactory, although expensive equipment is often constructed for that purpose.

At the dairy of the Napa State Hospital both the liquid and solid manure are successfully handled by a concrete combination manure pit and liquid tank on a side hill.

The pit is 12 feet wide, 20 feet long, and four feet deep, the lower foot and a half being roofed over with two-by-twelve boards on which the solids are dumped direct from the barn by the manure carrier.

The side walls extend upward two and a half feet from this movable plank false floor, allowing ample space for the storage of considerable manure if necessary. As the false floor is loosely laid, drainage is provided through the cracks, the liquids falling into the lower portion of the structure.

All of the washings and other liquid matter from the stable and milk house also empty into the liquid manure tank proper.

This tank, which is on lower ground but next to the pit, is 18 feet wide, 20 feet long, and about six feet deep, also made of concrete and having a concrete top, solid except for an opening at one corner which is covered with a trap door. Near this door is an electric driven pump used in lifting the liquid into a tank wagon, which is used in sprinkling it over the farm land.

Due to its being diluted with an immense amount of water from the stable and milk house, this mixture has not proved too rich for the good of land, but is a benefit. Both tank and pit are emptied frequently in fair weather, but not so often in the winter.

GRAINS AND FIELD CROPS.

Good grain yields are reported from Riverside county.

In June and up to July 20, 82 carloads of hay were shipped from Concord.

Tarweed has been getting pretty bad in some Glenn county wheat fields.

A Livermore valley wheat field is reported to have yielded 17½ sacks per acre.

Turlock melon shippers have arranged for inspection under the standardization law.

Utah capital recently bought the Corcoran Sugar Co.'s plant and an interest in Visalia Sugar Plant.

W. V. Shear of the State Horticultural Commission is inspector of certified potato seed under the law of 1915.

An Oakdale rancher harvested 12 sacks of wheat per acre, each weighing 125 to 130 pounds, from 180 acres.

Salinas Valley reports the brightest and best quality barley in years. Sales have been made at \$1.30 per cental.

Cool nights have delayed shipments from Le Grand melon fields. They expect to ship over 25,000 crates.

Average of all farm crops for all States of the Union are 101.6 per cent of normal according to U. S. Dept. Agr.

The Orland alfalfa meal mill operated by the Dixon Milling Co. has shipped 15 carloads but is storing much of its meal.

A stool of sudan grass containing 60 stems and standing 6 feet high was exhibited recently in Wilows. It was planted May 20.

The Dixon Milling Co. had ground 50,000 bags of alfalfa meal up to July 21. Growers are said to be getting \$15 per acre per cutting.

Turlock melons have been going East at about 40 cars per day, in spite of cool weather and patches drying up due to disease or drouth.

Knobby potatoes are nearly all due to fluctuating moisture supply and the resulting change from slow to rapid growth, says Wash. Expt. Sta.

Potato beetles are not common in Cal., but are in Utah and have recently been found in Washington. Spraying with paris green controls them.

Jas. Conniff of Patterson Pass, Alameda county, has a hay storage barn of 275 tons' capacity of loose hay. He expects to store when price is low and sell when high.

"Rim land" in Colusa county which floods in winter from the foothills, promises to make good rice. A 200-acre field near College City is estimated at over 40 sacks per acre.

To set cabbage plants late in July and early in August around Chowchilla is proposed by a dealer who offers to furnish plants, and a grader, crates, and a market for 10 per cent commission.

Sugar beets will be ready to dig in August around Burbank, according to D. W. Chamberlin. He drills seed in Mar., about 15 lbs. per acre about 4 inches deep, and thins to 8 or 10 inches apart. He irrigates two or three times and gets about 15 tons per acre. The price runs about \$6 per ton delivered at the sugar plant.

DECIDUOUS FRUITS.

Napa prune picking is commencing. Hanford and Armona are shipping Elbertas to the East.

Fresno county has 15 inspectors under the standardization law.

Carlots of Yuba City Tuscans are being sent to outside canneries.

The Bakersfield cannery is labeling its products "Packed in Bakersfield."

Prune and apricot growers met at Campbell July 25 in the interests of organization.

F. H. Wilson of Dinuba and Fresno is the new president of the Cal. Peach Growers.

It is estimated that 4000 tons of 1915 dried peaches are still in Cal. packers' hands.

The Mountain View Commercial Club formally endorsed the prune and apricot organization.

Duty on U. S. dried fruits to Brazil is 5½ cents per pound, fruit from other countries about 7 cents.

Brazil imported 1,660,000 lbs. dried fruit in 1914. U. S. furnished about 36,500 lbs. of this.

Jos. di Giorgio estimates that growers of Cal. deciduous fruit and melons will receive \$25,000,000 this year.

The largest cherry crop in the history of Santa Barbara county is reported by C. W. Beers, horticultural commissioner.

Prune and Apricot Day at Mt. View comes in early Oct. Premiums are offered again this year for the best fruit exhibited.

For years to come, the German dried fruit trade will be double what it has in the past, says a Baltimore man. He meant the more remote past.

A Placer county man proposes a 5-cent tax on every package of fruit condemned under the standardization law, and ½ cent for every one inspected.

The Sonoma Gravenstein season is said to be 20 days in advance of the average. The apples are extraordinarily high grade and free from blemishes.

A 10-acre pear orchard in Stanislaus county belonging to Mrs. E. O. McClure is reported to be yielding 100 tons which are being shipped to an Oakland cannery at \$60 per ton.

The Cal. Peach Growers' have leased packing plants in Sacramento, San Joaquin and Santa Clara valleys and their tributaries; and are building warehouses in Fresno county.

Santa Cruz and Monterey counties passed ordinances last Aug. prohibiting shipment of green fruit. The horticultural commissioners are preparing to enforce it. Juice sugar tests will be made on apples.

T. D. Buffington of Burbank has a peach tree over 28 years old and still yielding annual profits. The original trunk and limbs have rotted, but a new sap line has developed along the side and below each limb.

The plant of the Hemet-San Jacinto Growers' Association at Hemet is of the same size and capacity as the San Antonio Growers' Ass'n plant. Both are affiliated with the California Growers' Association, which has charge of the packing and sale of the fruit.

At the Medford meeting of the Pacific Coast Nurserymen's Ass'n., F. A. Higgins, Toppenish, was elected president; A. Brownell, Portland, Ore., Geo. C. Roeding, Fresno, Calif., and S. A. Miller, Milton, Ore., compose the executive committee; C. A. Tonneson, Tacoma, Wash., secretary-treasurer.

The big new cannery of the San Antonio Growers' Association at Ontario opened the run of peaches July 10 and is now working three hundred hands night and day. The Association controls nearly seventy-five Ontario, Chino, and Cucamonga districts; and despite the short crop is running fifty to one hundred tons of fruit a day, with ultimate capacity of 200 tons. The quality of the Tuscans crop is very high this year, offsetting the shortness of the crop, and there promises to be nearly a normal crop of Muirs and Lovells. Tomatoes will also be handled this fall and it is expected that the cannery will be in operation well into the early winter.

GEO. N. TYLER,
Brookdale Nursery, Los Gatos, Cal.

The Prune and Apricot Information Bureau reports had falling of prunes in Sacramento and San Joaquin Valley, since their last report, but Santa Clara prospects improved. Northwestern crop prospects 35,000,000 pounds, higher than previous estimates, but a third already sold at less than California growers are holding for. Contracts for trans-Atlantic freight are 50 per cent lower than some time ago, though export conditions are complicated. The California prune crop is now estimated at 75 per cent of last year's crop which the Bureau estimates at 170,000,000 pounds. About 80 per cent are still in growers' hands. The apricot crop is estimated at 8,500 tons or 45 per cent of last year's output. Prices have ruled 12½ and 13½ cents, with some sales at 14 cents. Most of the apricots are still in growers' hands. The domestic demand for apricots reaches its height in Oct. or Nov.

CITRUS, FIGS, OLIVES, NUTS.

Redlands had shipped 3206 cars of oranges up to Jul. 15.

Anaheim oranges sold recently in New York at \$4.65 per box.

Riverside had shipped 2940 cars of oranges and lemons up to Jul. 15.

Florida citrus fruits are out of the market until another crop matures.

Sicilian lemon imports are light, since importers lost heavily last season.

A 60-acre fig orchard three years old, near Esparto, is fruiting this year.

The Santa Barbara Walnut Growers' Ass'n reports the crop 75 to 90 per cent the size of last year's.

A Colusa county almond grower refused \$10,000 for his 30 acres of seven-year trees. The land cost him \$60 an acre.

Fallbrook olive growers subscribed \$10,000 toward a pickling plant to be operated under the California Associated Olive Growers.

Navels to the number of 1,782,000,000 have been shipped from Cal. in one season. Only 800,000,000 lemons went out last year, and the highest Valencia figure is 891,000,000.

A rising Eastern thermometer indicates rising prices on lemons, fancy stock having sold at \$6.65 f. o. b. as reported. They are \$9 wholesale in the East, and all used as fast as shipped.

GRAPES AND SMALL FRUITS.

Packing of Dinuba Malagas began this week.

Fresno shipped its first carload of Thompsons Jul. 21.

The recent hot spell in Sutter county sunburned only those grapes whose vines lacked foliage enough. Sultanias are ripening.

The Sebastopol Berry Growers had shipped 97 cars of berries to the East July 15. Some went as far as Pittsburg, but Chicago seems the economical limit.

MISCELLANEOUS.

Imperial Valley is short of water due to silting near the intake.

Squirrel extermination is the object of a campaign at Chowchilla.

Mushrooms are being grown on 320 square feet by E. M. Hughes of Gilroy.

Paul I. Dougherty has been appointed farm adviser for Imperial county.

The Bakersfield tomato crop is estimated at 16 to 18 tons per acre, selling at \$6 to \$8 per ton to canneries.

The Wis. Col. Agr. is shipping 6 to 25 Italian queen bees per day in co-operation with the State Beekeepers' Ass'n.

The Carneros Farm Center farmers near Napa have voted to bond themselves for \$5,000 to build a new school house of concrete with tile roof.

The Madera Canal Co. complains that the 115 pumping plants are

lowering the ground water level and thus seeping water from their ditches without paying for it.

The Mt. George Farm Center of Napa county was lectured with lantern slides July 22 on keeping their health by preventing flies, mosquitoes, etc., and by using septic tanks.

Since the opening of the State Public Employment Bureau Feb. 10, 1916, the Sacramento office has found positions for 347 agricultural workers, and up to July 1 had filled 1728 positions in all.

The U. S. Secretary of Interior has opened over 100,000 acres of non-irrigable land to homesteaders, allowing them 320 acres each. Kern county

includes 49,000 of this, San Luis Obispo 43,000, Santa Barbara 12,000 and Los Angeles 10,000.

WEED CUTTER MAKES DEEP PLOWING UNNECESSARY.

To the Editor: About deep and shallow plowing, as mentioned in your issue July 8, I summer-fallowed 130 acres of land near Crow's Landing in the spring of 1915. I plowed it about 3½ inches deep and kept it well harrowed and cultivated with weed cutter. This harvest, it turned out 25 bags of barley per acre. This

was one of the best crops in this vicinity. I have farmed this land for 7 years and never plowed it over 4 inches deep. It has been farmed continuously since about 1870.

Patterson.

E. W. Crow.

Pears shipped in the top tier of boxes sell higher early in the season because they are picked greener then, according to R. D. Stephens of Sacramento; but late in the season, top tier boxes sell for less because they get overripe due to uneven refrigeration at different levels in the car.

An Announcement of Hudson Policy

35,000 More Hudson Super-Sixes

Detroit, Mich., July 1, 1916

We have today to announce—

That more than ten thousand Hudson Super-Sixes have now been delivered to owners.

That we have in four months, by tremendous exertion, quadrupled our daily output.

That we have parts and materials, on hand and in process, for 20,000 more of the present Super-Six. Constantly increasing demand has just forced us to place contracts on materials for an additional 15,000.

Thus it is settled that at least 35,000 more of the Hudson Super-Six will be built like the present model. Our production is now 3,500 monthly.

No Change in Sight

Our opinion is that a like announcement will be made in a year from now. The Super-Six invention in one bound, increased motor efficiency by 80 per cent. From a small light Six, which delivered 42 horsepower, it created a 76-horsepower motor. And simply by ending vibration.

Stock Super-Sixes, in a hundred tests, have out-rivaled all other stock-car performance. In speed, in hill-climbing, in quick acceleration and endurance, they have done what was never done before.

No man can doubt that the Super-Six holds the pinnacle place among motors. And there is no higher place in sight.

After eight months of experience, with 10,000 cars, not one important improvement in design suggests itself to our engineering corps.

So the Super-Six will remain as it is. And, because of our patents, it will maintain its supremacy.

Watch the 10,000

Watch the 10,000 Super-Sixes now running, and judge if you want a car like them.

Each owner feels himself master of the road. He knows that in every sort of performance his car has out-matched all rivals.

He knows that he has the smoothest-running motor ever built. The most powerful of its size.

He knows that in ordinary driving he never taxes half its capacity. That means long life and economy.

He knows that his motor has shown boundless endurance—such as never before was shown. And that he can look forward to many years of its perfect present service.

Watch some of those cars. Talk to the men who own them. Then ask yourself if there is any fine car equal to it.

Now 135 Per Day

Thousands of men in the past few months have been forced to take second choice. Most of them, we think, now regret it, and will always regret that they did not wait.

Those times are over. We are now sending out 135 Super-Sixes per day.

Go ask our local dealer.

Variety in Ration of High-Producing Herd

(Written for Pacific Rural Press.)

That variety of feed will play an important part in the successful winning of prizes in the coming California Dairy Cow Competition seems assured from the experience of dairy-men who have secured high herd averages in the Ferndale Cow Testing Association.

While the economical growing of some of the feeds used in the following instances is almost entirely limited to Humboldt county because of soil and climatic conditions, a large proportion of them can be grown in many other localities of the State and should therefore be more generally considered.

On the farm of John Hansen at Loleta, where is held the record for grade cows among the cow-testing associations of the State, the feeds used are about as follows: March 1 to August 1, clover and rye grass as hay, pasture, and soiling crops; vetch and oats as hay and soiling crops; and cocoanut meal. August 1 to March 1, silage made from barley and vetch or oats and vetch, clover and rye grass hay, cocoanut meal, carrots, and stock beets.

Mr. Hansen is a dairyman with years of experience. His chief advice, next to the use of purebred sires, is to "feed cows generously the year round with a variety of feeds."

Gilbert Trigg of Ferndale, who secured the first prize at the State Fair at Sacramento two years in succession for the highest producing herd of grades in a cow-testing association, has depended in the past largely upon rye grass and clover for hay, pasture, and soiling crops, filling in with stock beets and carrots in the fall. But during the past year he has added oats and vetch, fed as a soiling crop, as well as a two-pound ration per cow of cocoanut meal, oil cake meal, and bran. He finds that his cows not only continue their heavy flow longer in the lactation period since the concentrates have been added, but are also in better condition to enter their next lactation period.

O. T. Willsie of Beatrice, who had 14 cows in his herd of 40 that gave 60 pounds of fat or better during May, credits breeding with much of his success, but has also demonstrated the value of abundant feed of the right sort.

Besides rye grass and clover used as in the above cases, he purchases alfalfa hay and cocoanut meal, being one of the first in Humboldt county to purchase hay from other sections of the State. Besides these he grows peas, vetch, and barley, all of which are fed green.

Just how the lack of feed may affect the yearly production of a herd is shown by Mr. Willsie's yearly cow-testing reports, those of 1915 when feed crops were light showing an average for the herd of 370 pounds of fat, while those of the year before, when heavy crops were harvested, showed an average of 389 pounds of fat per cow.

R. F. Fischer of Carlotta, owner of a purebred Holstein herd, also finds a decided advantage in feeding a variety of feeds. His herd has produced much heavier than when previously fed almost an entire al-

falfa ration. He also feeds clover and rye grass hay, oats and vetch hay, corn silage, alfalfa hay, and dried beet pulp, not believing it profitable to pasture; and considering dried beet pulp fully as valuable as stock beets or carrots and no more expensive.

FEED HOGS WELL.

(Written for Pacific Rural Press.)

It is a mistake not to feed hogs well, especially when they are young, according to Dr. T. A. Guthrie, who owns a ranch five miles north of Winters, Yolo county, on which registered Durocs are the chief consideration.

He bases this belief on experience, and instead of underfeeding he allows his hogs plenty of grain and alfalfa in order that they may be better developed animals.

In housing also, he disagrees with the old adage that "anything is fit for a hog," having learned by costly experience the folly of turning hogs into a straw stack for shelter against the winter storms instead of providing suitable but inexpensive houses.

Grain stubble, feterita, alfalfa, and tankage constitute the main ration now in use and very satisfactory results have been secured with them.

SOFT BUTTER.

To the Editor: What causes butter to be soft, even in the early morning? It gets too loose when churning at 55 degrees. The cow has good pasture and gets no hay.—L. R. A., Kingsburg.

[Your trouble may be one of several. It is possible that cooling the cream directly after milking would help. It is also possible that the feeding of some hay instead of pasture alone would cure the trouble. Sometimes soft butter results from allowing it to stand too long after taking from the churn before working. When this occurs and the unworked butter is allowed to get hard, your trouble oftentimes results.—Editors.]

CLEAN PIG TROUGH.

(Written for Pacific Rural Press.)

A handy pig trough to keep the water clean and cool and the approach dry, is described by D. L. Schrader as being used on a ranch in the San Joaquin valley. It is made of corrugated iron, the top covered tight to keep out sun and dirt. Along the side are semi-cylindrical cups about 8 inches across and reaching from below the bottom of the tank to as high as the water level in the tank is permitted by the automatic shutoff. Near the bottom of the tank is a hole opening into each cup so the water in the cups is always at the same level as in the tank. The cups are drainable by pulling a cork in the bottom of each to clean out any dirt.

This rancher likes the idea so well that he is building a concrete tank 16 feet square at the corner of four fields. This is to have eight "cups" available for stock in each field.

Kings county creameries paid 26½ to 31.7 cents for butterfat last month, most of it being graded.

It has been fully demonstrated in California that a Silo

Will be at the Live Stock Shows With

Jersey Cattle

and O. I. C. Swine

With our herd will be a number of young Jersey bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

LIVE OAK STOCK FARM

FRANK A. MECHAM ESTATE, PETALUMA, CALIF.

A Mecham Rambouillet.

We are offering for this season a fine lot of yearling rams and ram lambs. Individual or carlots. Write or call and see the flock. Take electric car either at Petaluma or Santa Rosa for Live Oak station.

We have some choice Red Polled Bull Calves for sale.

American Merinos, Shropshires, Rambouillets

Our flocks are the result of 50 years of careful breeding and selection by the late F. A. Mecham. None but the best are sold or kept for breeding purposes. Sixteen rams selected from P. P. I. E. winners added to flock last fall.

California State Dairy Cow Competition.

[By F. W. Woll, Professor Animal Nutrition, University of California.]

The University of California is about to inaugurate a state competition for dairy cows, for prizes of \$4,700.

There are in California over one-half million milch cows, valued at about \$38,000,000—an amount of money which is but slightly larger than the total annual value of the dairy products of the State. The average yearly production per cow is not known with certainty, but is evidently below 150 pounds of butterfat. On the other hand, two cows in the State have produced more than 900 pounds of butterfat each in one year, and a considerable number more have each produced above 600 pounds during this period. There are also dairy herds that averaged over 400 pounds of butterfat per cow per year.

The average production of cows in the State is, therefore, not as much as one-sixth of that of exceptional cows, and is not much over one-third that of the average production of cows in a number of good dairy herds in the State. The high records mentioned were made by cows of exceptional capacity for feed consumption, whose ancestors were bred for high dairy production for many generations. They represent, therefore, the highest type yet reached by intelligent and consistent methods of breeding along dairy lines, and are not only the result of great skill in feeding and handling of cows.

Experience teaches us, however, that production by dairy cows can be very appreciably increased by a better system of feeding and management than is now practiced by most farmers. There is considerable evidence indicating that a large proportion of the cows in this and other states do not produce sufficient milk to much more than pay for their keep, and many are kept at an actual loss when the feed they eat is figured at ordinary market prices. It becomes important, therefore, to demonstrate to our farmers the possibility of improvement in the production by dairy cows and to stimulate their interest in modern methods of dairying.

As a step in this direction, the College of Agriculture of the University of California will conduct a Dairy Cow competition during the period November 1, 1916, to February 28, 1918, in connection with official testing of dairy cows for production of butterfat in which the college has been engaged for a number of years past. The competition has been rendered possible through the hearty co-operation of breeders of purebred dairy cattle, feed dealers, creamery companies, and others interested in the advancement of the dairy industry, who have subscribed a fund of over \$4,700 for the award of prizes for records of production made by cows in the competition. A large number of special prizes of purebred bull calves, dairy apparatus, and feeds have likewise been donated in order to make the competition of general interest to dairy farmers and to insure general participation. Circular 153 of the College of Agriculture gives full information concerning the competition. A copy of

it will be sent upon application to Dean Thomas F. Hunt, College of Agriculture, Berkeley, California.

[This was forecasted on the front page of our issue July 22 and further details will be presented in next issue.]

FEEDING DRIED BEET PULP.

Sugar beet factories of California have commenced operations. Last season the crop of dried beet pulp was entirely sold out,—in fact, for several months past there has not been a pound available. There will be a considerably larger supply this year on account of another large drying plant having been installed at one of the sugar factories that heretofore has not dried its pulp, but even with this extra supply there is some question as to whether the demand will not exceed the supply before the season is over.

Dried beet pulp is simply the natural root of the sugar beet, shredded clean and pure, with only the sugar and water extracted. Within an hour from the time the sugar beets enter the sugar factory the dried beet pulp is in the sacks, dried, and ready to be loaded on the cars. There is no possibility of its souring; and the drying process is so thorough that the pulp will keep like grain or any other mill feed.

In the western states dried beet pulp is fed principally with alfalfa, the combination making a balanced ration—but it is also used in combination with many other rations.

"Shall I feed it dry or wet?" is a question that is frequently asked. It is just as good one way as the other. Let the cows decide it for you. They'll soon tell you which way they like it best. When you first start to use it, try feeding it wet—if soaked beforehand the actual amount of water used is immaterial—and you will probably find that the cows like it better that way than they do dry. After they have become accustomed to it, you can gradually switch over to the dry feeding if you find it advisable.

"How much shall I feed?" For an average cow of about 1000 pounds weight, giving 25 to 30 pounds of milk daily, feed 8 to 10 pounds of pulp (weighed dry) and 18 to 20 pounds of good alfalfa hay for roughage, or as much hay as the cow will clean up thoroughly. Give the beet pulp first, dividing the amount into two feedings.

As dried beet pulp contains between 65 and 70 per cent of digestible carbohydrates, the ration recommended above would supply approximately 2½ pounds of digestible protein and about 14 pounds of digestible carbohydrates, which is the amount and proportion of digestible nutrients required for the average dairy cow.

If you cannot get alfalfa hay at a reasonable price, it would be necessary to feed cottonseed meal, tankage, or some other protein feed with the pulp. It might be wise to displace a pound or two of pulp with an equal amount of grain or mill feed, for the sake of variety. These are points that can best be settled by each feeder.

"DOG DAYS" the best time to buy a DE LAVAL SEPARATOR

THERE WAS NEVER BEFORE as good a time to buy a De Laval Cream Separator as right now.

THE "DOG DAYS" ARE AT hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator.

THEN THERE IS THE GREAT saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.

THIS IS LIKEWISE THE SEASON when De Laval superiority counts for most over other separators,—in closer skimming, larger capacity, easier running, easier handling, easier cleaning and absolute sanitarianism.

A DE LAVAL CREAM SEPARATOR bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

Look up the nearest De Laval Agent AT ONCE, or drop us a line and we will have him look you up.

De Laval Dairy Supply Co.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST. We specialize in Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Send for special Catalog.

With the Livestock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

An Orland dairyman was fined for not cooling his cream properly.

Twenty-two Minnesota co-operative creameries paid 31 to 40 cents for April butter fat.

A Live Oak dairyman was fined for selling cream containing flies, hair, bad smells, etc.

Frank Morris of Woodland has charge of the Cal. Holstein Breeders' sale at Hanford Oct. 18.

An Ohio Ayrshire has produced 548.44 lbs. fat from 15,794 lbs. milk as a three-year-old record.

Chas. Eldridge of Chumacum recently lost his young world's milk record cow Margie Juanita.

The Danish Creamery of Fresno paid 29 cents per lb. or \$42,141 for 147,774 pounds fat in June.

Gomez Cevola will establish a dairy on a newly acquired ranch in District 17 out of Stockton.

W. H. Saylor of San Francisco has bought the Greer ranch near Modesto and will put dairy stock on it.

The Exeter Creamery put out more butter last month than ever. They bought \$10,000 worth of butterfat.

The Palo Alto Stock Farms shipped the two-year-old Holstein bull Ragapple Imperial Korndyke 4th to South America early last week.

University Farm butter scored 93 in the July scoring contest at San Francisco. Sunset Creamery, Loleta, butter scored 94. Seventeen others scored 90 or above.

To produce three gallons of milk per day, a grazing cow must eat 100 to 125 pounds of grass, says Mo. Expt. Sta. They should graze during the coolest parts of the day.

The Ohio Expt. Sta. had a bull whose daughters averaged 153 pounds more butterfat annually than their dams. Here is a good basis for judging utility value of a bull.

A new California Guernsey record has recently been made at Edgemoor Farm, Santee, by the cow Mable of Linden Home who finished her yearly record June 15 with 16,945 pounds of milk containing 752.36 pounds of fat. This beats the former State record by 30 pounds. This cow was sired by Glenwood's Reputation and out of the cow Sterling's Fantine.

The old "Santa Clara" cheese factory started June 15 to use the overproduction of fresh milk of that district. Shipments of cheese have been going since July 15 and the 25 members of the United Milk Producers are furnishing 5000 gallons milk daily. The daily output is 1000 pounds Cal. cheese and 800 pounds "jack cheese," writes W. S. Sullivan of Agnew.

One of six cows that have made over 20 pounds butter in seven days as two-year-olds which will be sold by McAlister & Sons at their combination sale with Col. Ben Rhoades, Rivera, Sept. 19 and 20, is Iris De Kol Aaggie Lass which recently com-

pleted a record at the age of 2 yrs. 1 month of 24.12 lbs. butter from 452.5 lbs. milk in 7 days and 98.58 lbs. butter from 1868.3 lbs. milk in 30 days.

The Millbrae Dairy reports the completion of a number of seven-day records in their herd of registered Holsteins, among them being Angelina of Millbrae who as a senior four-year-old made 31.86 pounds of butter. This is the first daughter of a 30-pound cow in the State to make as good a record, her dam, Sleepy Barillos of Millbrae, having made 30.88 pounds of butter this spring also. A three-year-old half sister to the bull Tilly Alcartra's Son made 24.96 pounds of butter. Although testing in this herd was only started a year ago last May there are now 33 A. R. O. cows in the herd or just about half of the entire herd.

The Palo Alto Stock Farms have a carload of registered Guernseys en route from Wisconsin to add to their registered Guernsey herd at Palo Alto. They are also importing among other Holsteins an outstanding herd sire and a high record two-year-old cow from the New England States. There are now nearly 200 Holsteins and Guernseys on this place, 70 of which are milking. Inspected and certified milk is being sold from the ranch. W. Daniels is now assisting Mr. Tichenor, general manager of the ranch, the former having formerly been in charge of the Walter Dupee Guernsey herd in San Diego county.

SWINE BREEDERS AND STOCK.

Mr. Tubbs of Calistoga has a fine herd of 100 Yorkshires.

J. E. Buckholz of Chowchilla recently shipped seven carloads of hogs to San Francisco.

The State Agricultural Society is building 300 new floored pens for hogs at the State Fair. Water pipes run through the pens and other conveniences are added.

F. L. Foster of Chowchilla brought three young purebred Berkshire sows last week from the Iowa Agricultural College. Mr. Foster also has some Berkshires from Cal. University Farm and 17 purebred Durocs.

OTHER LIVESTOCK.

An exchange for worthy breeding animals at the Solano county fair is proposed.

Paul Gerber of San Antone Valley, Alameda county, shipped 75 beef cattle to San Francisco recently.

A. M. Crittenden is building a modern dairy barn near Mountain View.

Caterpillars are driving thousands of sheep out of the Butte county mountains by eating their brush feed.

The Oregon Livestock Ass'n recommended that the Agr. College compete at the State Fair, and they will do it.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

SWINE.

BILLIKEN HERD OF IMPROVED CHESTER WHITES.—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sizes used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. R. Cunningham, Mills, Sacramento County, Calif.

YOUNG POLAND CHINAS, LARGE TYPE.—Boar IRA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows 1-2 to IRA Wonder at very low prices; also weanlings, pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

REGISTERED Duroc-Jerseys.—All ages. We have produced hogs weighing 240 lbs. at 7 months, at a cost of 3-10 cents per pound, including pasture, grain and upkeep of sow. If you want some of the kind it pays to raise, we would suggest that you order immediately, as our spring stock is going rapidly. Haden Smith, Woodland, Route No. 1, Box 84D.

REGISTERED Duroc-Jersey.—Weanlings, shoats, gilts, and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

HAMPSHIRE SWINE.—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES.—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

NOW IS THE TIME to breed for Fall litters. I have a choice lot of young boars ready for immediate service. Also bred sows, bred gilts, weanlings of both sexes. Attractive prices will be quoted for quick sale. Geo. A. Smith, Corcoran, Cal.

DUROCS, from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy, with fine backs and deep cherry color. We sell only those we'd like to keep in our herd. Don't write us if you want cheap stock.

BERKSHIRES.—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

FOR SALE.—Fancy belted Hampshire hogs. Well belted young sows and boars registered. Prices reasonable. Ben F. Thorpe, Manager, Canfield Estate Ranches, Bonsall, California.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feed for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

LARGE, QUICK MATURING registered Berkshires—Both sexes, \$10 each for weanlings. Older ones at farmer's prices. J. H. Bomberger, Modesto, Cal.

REGISTERED PUREBRED BERKSHIRE PIGS.—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

LARGE TYPE POLAND CHINAS.—Now booking orders for Spring pigs from our Nebraska prize-winning sows. H. I. Marsh, Route A, 348, Modesto.

LITTLE BLACK ESSEX.—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

IMPERIAL STOCK FARM BERKSHIRES.—Registered stock of all ages. Prices and description on application. R. J. Merrill & Son, Morgan Hill.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

REGISTERED BERKSHIRES.—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

POLAND CHINAS.—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

POLAND CHINAS.—250 lbs. in six months our aim. Imported sows. None better. Linn & Porter, Route A, Modesto, Cal.

BIG-TYPE POLAND CHINAS.—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

REGISTERED IMPROVED CHESTER WHITES.—Grize Bear Ranch, East Auburn, Cal.

REGISTERED POLAND CHINA SWINE.—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

REGISTERED DUROCS.—Herd headed by Crimson March 2nd. Write for prices. J. M. De Vilbiss, Patterson, Cal.

REGISTERED POLAND CHINAS and Duroc Jerseys.—Cholera immune for life. T. H. Beckman, Lodi, Cal.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs, \$10. H. E. Boudier & Son, Napa.

30 REGISTERED BERKSHIRES.—Boars and gilts for sale. J. H. Benedict, Lemoore, Kings county.

REGISTERED BERKSHIRES.—Weanling pigs, \$10 each. G. A. Casey, R. 7, San Jose.

REGISTERED BERKSHIRE BOARS.—Gilts and weanlings. Choice stock. W. M. Mikesell, Manteca.

POLAND CHINA HOGS FOR SALE.—Registration papers furnished free. C. A. Cooley, Durham, Cal.

REGISTERED DUROCS.—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

REGISTERED Duroc-Jersey SWINE.—Both sexes. Big-boned type. B. F. Kendall, Hanford.

POLAND CHINAS.—Large Type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

REGISTERED POLAND CHINAS.—Young stock for sale. J. H. Cook, Paradise, Cal.

REGISTERED BERKSHIRES.—Young stock for sale. F. W. White, Elk Grove, Cal.

HOPLAND STOCK FARM.—Registered Berkshires. Prices on application. Hopland, Cal.

REGISTERED BERKSHIRE PIGS.—Write or call Greenwood Ranch, Brentwood, Cal.

KNOB HILL STOCK FARM.—Registered Poland-China Swine. A. M. Henry, Farmington.

HAMPSHIRE.—Registered stock for pride and profit. Frank Brown, Burbank.

REDAOKS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

REGISTERED POLAND CHINAS and Duroc-Jerseys. H. F. Harrold, Orland.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

THE J. S. GIBSON COMPANY

BREEDERS OF

Holstein-Friesian Cattle and Berkshire Hogs

The Pacific Rural Press,

Williams, California, July 24th, 1916.

Gentlemen:-- In looking over my sales list I find that over 90% have come through the Pacific Rural Press. I advertised with the ~~the Pacific Rural Press~~ for over a year and made one sale. The past six or eight months I have been advertising with a couple of other farm papers but with out results. The Press seems to be the paper for the results.

Yours very truly,

James Gibson

Vice-Pres.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Komdyke Alcartra, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, Escalon, Cal.

REGISTERED HOLSTEINS—Sired by King Komdyke Hengeveld Ormsby 53822. From world record cows Pontiac Maid Ormsby and Duchess Skylark Ormsby. Geo. Kunlos, Modesto, Cal.

REGISTERED HOLSTEINS—Colantha Johanna Lad and Aralia De Kol breeding. Young stock for sale from A. R. O. cows. Lester A. Driver, Nicolaus, Cal.

JERSEY BULLS AND BULL CALVES—Sons and grandsons of 2 and 3 lbs. cows. None better. Cheap for quality. N. H. Locke Co., Lockeford, Cal.

HOLSTEIN BULLS—Well marked, large, straight individuals. Tuberculin tested. \$100 up. Packwood Farm Herd. W. F. Mitchell, Visalia.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain Chascoe young stock for sale. John Lynch Ranch, Box 321, Petaluma, Cal.

DAIRY CATTLE.

JERSEY BULLS—Serviceable age. Sons of Gertie's Lad, who has two daughters that made over 600 lbs. butter as two-year-olds. A. A. Jenkins, Tulare.

REGISTERED HOLSTEINS—32 high-grade Holstein heifers coming fresh this Fall for sale. E. E. Freeman, Route B, Modesto, Cal.

BULL CALVES from a grandson of Colantha Johanna Lad and from a son of King of the Pontiacs. J. W. Benoit, Route C, Modesto, Cal.

HOLSTEIN BULLS out of A. R. O. cows, sired by a son of King of the Pontiacs. Prices reasonable. J. H. Harlan Co., Woodland, Cal.

THE McCLLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

TWENTY-EIGHT high grade yearling and two-year-old Holstein heifers for sale; some bred. K. W. Abbott, Milpitas, Cal.

REGISTERED JERSEYS—Herd established 1869. Young bulls from best cows. Rancho Dos Rios, R. 2, Modesto.

BREEDER OF REGISTERED JERSEY CATTLE—Duroc swine. Young stock for sale. W. J. Hackett, Ceres, Cal.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier, Cal.

CROLEY'S CALF FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc. 631-37 Brannan St., San Francisco.

D. O. LIVELY, 216, Hobart Building, San Francisco, buys and sells live stock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES—Gilts bred to 800-lb boar. Ed. E. Johnson, Turlock, Cal.

DOGS.

AN OPPORTUNITY to purchase thoroughbred Collies. Having a greater number of thoroughbred Scotch Collies than I can accommodate, am willing to sell a few the year and older at a great sacrifice. The dogs are all bred by the noted prize-winners of the BROWN-VALE KENNELS, Redwood City.

Beef types of cattle were shown on lantern slides by Prof. J. I. Thompson at the Rio Vista Farm Bureau meeting recently.

S. M. Sydenstriker of Corning recently purchased 740 acres near the Sutter county Buttes and expects to stock it with sheep and cattle.

Eighteen Los Angeles county dairymen were guests of Ed Webster to inspect the El Centro creamery and dairy country not long ago.

Entries for the Sonoma and Marin Agricultural District Fair Aug. 7 to 13 close Aug. 1 except for perishable agricultural, horticultural, and home products.

BERKSHIRE QUALITY SALE.

A visit to Carruthers Farms before their first annual sale day is like visiting a high-class Berkshire show, except the ribbon display after the judging.

Well-bred hogs finished as only an experienced feeder can hope to accomplish, was the sight presented to us in a visit to this breeding establishment during the past week, and, as Ed Brown, the herdsman, remarked, "A man that can't suit his Berkshire fancies here can't be suited anywhere."

The most striking feature about the hogs to be sold in this sale, to the writer's mind, is the number of high-class sows that are catalogued. Altogether 20 under-a-year sows will go through the ring. While space will not permit us to elaborate on individuals, there are eight daughters and granddaughters of Rival's Champion Best in the lot, almost a year old, that are as fine a lot of foundation sows as we have ever seen offered in a bunch at public sale.

All of the sows of breeding age are bred to the several outstanding herd of boars, among which are Ames Rival 121st, a boar of immense depth and breadth sired by Rival Champion Best and out of Belle Rival 17th. As an aged boar, this fellow is one of the best in the West today and much better than when shown at the P. P. I. E. last year. Sows in pig to him would appear to be very desirable.

Another boar which many of the sows are bred to, and which is himself, being offered in the sale, is Royal Rival 6th, a junior yearling and a winner at the P. P. I. E., that weighs between 550 and 575 pounds. He is one of the best show prospects among the older boars offered.

In younger boars a wide selection in breeding and individuality has been made possible by cataloguing animals of various ages and breeding. Several of them have been selected purposely as herd sires for three sow groups, in the belief that these young breeders' herds will be in demand on sale day. Others have been chosen as being good enough to meet the requirements of the most fastidious breeder in search of a herd sire, while still others of the same breeding, but not outstanding show animals, have been catalogued for those wishing good useful boars of unusual breeding.

Every preparation, we found, is being taken to properly care for visitors on sale day, and as the ranch is easily reached by electric and steam roads as well as directly adjoining the State Highway, there is very reason to believe that a large crowd of swine breeders from all parts of the West will face Colonel Hord when the first bid is called for on August 2.

Silage Increases the Milk Flow 25 per cent and Reduces Feeding Costs 15-20 per cent

IT IS NOT A QUESTION of whether you can afford a silo. It is a question of how long you can afford to be satisfied with the lowest milk yield from your cows, and the highest cost for feed.

SILAGE IS BY FAR the least expensive feed you can use and at the same time the greatest milk-producing feed. Decide now to have a silo.

IDEAL GREEN FEEDS SILOS

are increasing the profits of thousands of Pacific Coast dairymen. Men who use these silos are getting big returns because their cows are giving a large flow of milk.

THERE IS NO QUESTION about the value of silage—GOOD silage. The only men who doubt the value of silage are those who have not investigated or who have bought "cheap" makeshift silos that produce a poor quality of silage.

IT DOES NOT PAY to try to save a few dollars on the first cost of a silo. The losses due to spoiled silage is likely to amount to many times what you hope to save on the first cost.

REMEMBER that you will get from 20 to 30 years' service from an Ideal and that it is a strong, tight silo that will protect your silage perfectly. In the better quality of silage you get, the Ideal saves each year more than the difference between its cost and that of an inferior silo.

DO YOU WANT PROOF of the extra value of the Ideal? Do you want to know just why it will give the best silage and last the longest? Then write us and ask us these questions and particularly tell us what kind of feed you can raise to put into the silo and how many cows you will want to feed silage.

E., etc. Some bred to Fashion Longfellow 5th, Baron De Lux, and Rival Emblem; others open.

Here is a chance to get a bargain.

CALLA GROVE FARM

Manteca, Cal.

San Diego Hillside Milk Barn.

From cows to truck, the milk is all and always conveyed by gravity.

[Written for Pacific Rural Press by Chas. F. Barnum.]

Cheap, convenient, and economical dairy equipment is to be seen on the E. H. Webb Dairy at San Pasqual valley 35 miles east of San Diego. Milk from the night before reaches its destination by motor truck at San Diego in time to go all bottled on the milk delivery wagons at 11:30 a. m.; and is said by the Manager of the P. M. Dairy Association to be in the best condition of any received.

The superior quality of milk, according to Mr. Webb, is mostly due to the method and convenience in which his hillside dairy structure permits the handling.

On the top of a hill are two paved corrals used for receiving two strings of cows 24 in each corral. Each cow seems to know its own corral and goes to it every night and morning before milking time. Both corrals open into a paved curbed lane which leads down a slope into the milk shed a few feet below. Twelve cows are let in on one side while the twelve just let in before them are being milked in the 12 stanchions on the other side of the milk shed by a Hinman milking machine. The corral system permits each cow to be milked within 15 minutes of the same time each morning and night.

A high reservoir 15 feet above the barn on another hill provides sufficient pressure to slush out the corrals and barn.

All manure and residue is caught at one point and drained into a 12-inch pipe 100 feet long, lying lengthwise and below the barn. Connected with this pipe on one end is a 4-inch pipe which runs out to irrigate the alfalfa. On the other end is a reservoir pipe connection, also a trap for closing off the drain from barn.

The drain or trap closed enables the water pressure from the reservoir to enter from behind and force the manure onto the alfalfa at any level below reservoir.

Milk from the cows is poured into a chute which takes it down another story into a large milk cooler; then again down through 4 ply of metal gauze strainers into the delivery cans.

Mr. Webb thinks the metal strainers far superior to the cloth or gauze on account of being easier sterilized.

The milk, now in the cans, is rolled down another notch into the motor truck which backs up to a platform at bottom of the hill.

SHEEP ON A DAIRY.

[Written for Pacific Rural Press.]

Sheep and dairy cows are not generally considered an ideal combination, but W. E. Elliot finds them both profitable on his ranch in Humboldt county.

This is largely due to the location of his ranch, only a part of it lying low, and the balance being hill land badly depleted of fertility by continual cropping.

On the lower land, vetch, clover, rye grass, and root crops are grown for the herd of about 25 cows which has been maintained for the past 20 years. All of these are of Jersey breeding, a portion of them being

purebred. During the past seven years, the herd has been entered in the Ferndale Cow Testing Association. By systematic selection and breeding the herd average has been increased from 275 to 350 pounds in that time.

Sheep are comparatively new on the ranch, having been founded three years ago to build up the hill soils.

The original ewe band was composed of purebred Shropshires; and Shropshire rams have been in service since then. By selecting the best ewe lambs the flock has been enlarged to 75 ewes; and this will be further increased in the same manner to 200.

Like all of the northern coast section, Humboldt county sheep produce a good clean fleece; and while lambs are the chief consideration on the Elliot ranch, the ewes have sheared as high as 12 pounds and have averaged eight pounds of wool this season which sells for well over 30 cents a pound.

Lambing has been done in December and March in the open, the older ewes lambing at the earlier date. The mild weather permits lambing at any time of the year, but sheds would doubtless mean a saving of lambs on account of the winter rains. Coming in the spring, however, when there is abundant green feed, the lambs make rapid growth, four-month lambs having averaged 76 pounds this year and sold for \$7.25 a hundred pounds.

That both the quality and quantity of the hill feed may be improved, orchard grass, rye grass, and some clover will be sown. It is expected that these and the manure of the sheep will greatly improve future yields on the land.

CHEAP GOOD PLASTER SILO.

[Written for Pacific Rural Press by Chas. F. Barnum.]

On the S. A. Martin dairy at Burbank, Los Angeles county, is to be seen a very novel yet practical and cheaply built silo. First a cement foundation was laid circular and 10 feet in diameter. On this was then bolted by anchor bolts, a wooden form to which were attached the uprights which form the silo walls. These were 2x3 inches 20 feet long and placed 1 foot apart. They were bridged together like floor joists generally are by crisscross pieces.

On the inside and outside of this framing was nailed metal lathing from bottom to top covering the entire frame. Then five tank hoops were placed on outside. The first coat put over the lath was 5 parts lime plaster with lots of fiber, and 1 part pure cement. The second coat was 5 of pure cement and 1 of plaster with the fibre left out. The third and last coat was half and half sand and plaster.

This same plastering was used on the outside as well as the inside. The five door spaces left were framings 2x2 feet. Mr. Martin tried out this experimental silo last year and claims it is a wonder. "No part of my corn silage was wasted, and next year I will add another of this same kind of silo," said Mr. Martin.

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

Herd of Holsteins Headed by Prince Gelsche Walker and including 22 of His Daughters

Breeding animals in the registered Holstein herd at Santa Anita Rancho are the result of careful selection in which the requirements are high individual quality, heavy and persistent production, and proven transmitting ability. All females are placed on official test as they freshen. A few splendid young bulls out of A. R. O. dams for sale at prices well within their value. SONS OF THIS FINE HERD SIRE FOR SALE.

A 34 POUND BULL IS NOW OFFERED FOR SALE

The name of this youngster is DUKE CORNUCOPIA SARCASTIC 157545. Born February 14, 1915.

His dam: ALBA SADIE CORNUCOPIA 138651. As a 4-year-old she made 28.85 pounds of butter in 7 days, and just recently as a 5-year-old she increased her record to 34.13 pounds butter under official test. This is the largest butter record ever made by a cow in 7 days in California. She is a splendid individual, and a persistent producer. She is sired by SIR SADIE CORNUCOPIA, 34 A.R.O. daughters, 3 above 30 pounds butter in 7 days. He by Aaggie Cornucopia Johanna Lad, 97 A.R.O. daughters, 3 above 30 pounds, and out of AAGGIE CORNUCOPIA PAULINE 34.32 lbs. butter in 7 days, 128.98 lbs. in 30 days. This cow held the world's record for 8 years, and she is the dam of SADIE VALE CONCORDIA 4th, who has over 40 pounds of butter in 7 days to her credit.

His Sire: WOODCROFT DE KOL SARCASTIC LAD, already has 2 A.R.O. daughters, one a 20.03 pound 4-year-old. He is by AAGGIE CORNUCOPIA 3d LILITH, 21 A.R.O. daughters. His dam is a splendidly bred cow, sired by a son of DE KOL 2ND'S BUTTER BOY 3D. We guarantee this bull to be a breeder.

Also Percheron Horses, Mammoth Jacks, Berkshire and Poland-China Hogs. Correspondence Invited

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

PIGS DEFORMED.

To the Editor: What causes a litter of pigs to be deformed in their hind legs when they are not interbred?—M. T., Moraga.

[Causes for this trouble are too many for the specific one to be ascribed without additional data.]

HOGS HAVE COUGH AND RASH.

To the Editor: Hogs get mopy, have a wheezing, hacking cough, skin thickens, gets hot and a rash breaks out, nose runs, constipated. Hundreds of hogs have died with it.—K. L., Badger.

[This is hog cholera. Have the apparently well animals vaccinated immediately, as it is the only way to stop such an outbreak.]

TUMOR FROM INJURY.

To the Editor: My driving mare was injured on the breast by the blanket falling off, and the cord it was tied with cutting in front of her breast and pressing on one of the cords of her neck. It has formed a tumor. I have put iodine on it and blistered it, but it remains big as an egg.—L. G. J., Arroyo Grande.

[Have this lanced, as there is an exudate which must be evacuated.]

COW EATS DIRT.

To the Editor: A cow's calf had died before birth and completely decomposed. It was removed and the cow came back to her milk and ate well, but ate dirt whenever she got the chance. Bowels were loose—passage looks like thin mud. Has access to salt at all times and is fed alfalfa hay and dry pasture. Has been a heavy milker 5½ years.—H. B. J., Lakeport.

[Give this cow one dram powdered and dried iron sulphate once a day.]

CALVES BREATHE HEAVILY.

To the Editor: We are losing calves which cough and breathe heavily. Some stockmen say it is contagious pneumonia. Does the State send out a cure for it?—T. O. G., Lancaster.

[This is infectious pneumonia. I believe that if a vaccine were made from the lesions found in the lungs and used on the calves it would work a material benefit. Express an infected lung, fresh, to The Cutter Laboratory, Berkeley, and ask their opinion as to the organism causing the trouble; and ask them to make up a vaccine to use on the calves. Medicinal treatment has up to date yielded no results.]

SWELLING UNDER JAW.

To the Editor: Last winter a swelling came under and between a cow's jawbone and forward to her nose. I put on a mustard plaster; and when I found a soft place, knifed it letting out pus. Then syringed it every day with peroxide and sheep dip until it healed. Two weeks ago it swelled again, principally on one side. I blistered with liniment; now it is soft and flabby at the lower end but hard back near the throat. It doesn't bother her eating.—C. B., Yuba City.

[There was a pus pocket left in the old abscess which did not have drainage which has caused this secondary abscess. Have this lanced.]

COW HOLDS MILK.

To the Editor: Our cow sometimes will not let down her milk, even after she has been letting it run. Sometimes the milk is lumpy like cheese and slimy and in long

strings. She acts like a balky horse. S. P., Parlier.

[This is a habit which is in most cases impossible to break up. It would be advisable to sell this animal unless you have lots of patience and ingenuity.]

SWELLING ON JAW.

To the Editor: Three days ago a swelling the size of a lemon came on my cow's jaw. The same thing happened last year and the veterinarian gave me an ointment containing Spanish fly for a blister. As there is no veterinarian around, I used the same this year; but next day the swelling was large as half a melon. On the third day, the swelling is somewhat reduced but her nose and eyes run water. For the past two weeks the cows have been in a pasture of fine clean red oats nearly ripe.—Sub., Calistoga.

[This is an abscess and needs lancing.]

HORSES OVERHEATING.

To prevent horses from overheating is much easier than to cure them.

Give at least a pailful of water to each horse about 10 o'clock and again at 3 or 4 o'clock on a hot day.

Be very careful with a horse that is a little out of health, if you are working him on a hot day.

Look out for a horse that after sweating freely suddenly stops sweating. Put him in the shade as soon as possible and give a moderate drink.

Do not put a horse not in good condition for hard work in the center of a four-horse team in hot weather.

Work carefully on a hot day when the atmosphere is moist and heavy.

A horse can hardly get too hot to water, but one must regulate the amount by the temperature of the water.

In case of an attack of overheating, the horse should be taken to the shade and diluted stimulants given as soon as possible. A treatment of the surface of the body, particularly of the head, with cold water should be given until the temperature is within a degree or two of normal.

It is better to plan to avoid overheating than to plan to treat the

horse for it.—University Farm, St. Paul, Minn.

SENSIBLE SILO FILLING.

[Written for Pacific Rural Press.]

They put silage into silos more intelligently in Wisconsin than in California, according to Otto Baldenweg of San Bernardino county, who came to Cal. from Wis. about four years ago. Here we have only a man or two inside the silo—there they have four. Here, we drop the silage from the top. That makes the atmosphere nearly unbearable. It puts the heavy stuff in a hard cone in the center, leaving the fluffy light stuff around the edges where it could scarcely be properly tramped down if there were enough men to do it. This fluffy stuff contains air which tends to greater spoilage. In the fierce atmosphere, the silage is seldom properly distributed, much less properly tramped.

In Wisconsin and a few places in California, a flexible jointed pipe leads the silage from the top of the silo down to a man, who swings it around to distribute the silage evenly and with good breathing.

These jointed pipes may be used later to lead the silage to the ground as is done by G. V. Rude near Imperial. A funnel-shaped top section is fitted with hooks to hang over the door edges. The rest of the joints hang on each other from this to the ground. Connections are made by a pair of short chains fastened on opposite sides near the lower end of each. At the end of each chain is a cross bar which is inserted through a hole near the top of the next lower joint.

Similar distributing pipes are made in 30-inch lengths, all hung onto a pair of chains which carry all the weight, rather than hanging it on successive joints.

Good Enough for Any Herd

AGGIE GRACE PONTIAC CREAMELLE
Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Klondyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915. Write or call and see the herd.

ROOM FOR GROWING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Don't forget that August will soon be here and the pullets that were early hatched are among the early fall layers. It stands to reason that it just what everybody wants and is hoping for, but unless you do your part the pullets will balk at theirs. Every week they are growing and require more room, so it stands you in to be moving them to more roomy quarters. Next to short rations, crowding in brooder, brooder house, or in small weaning houses cause more pullets to be stunted and lose time maturing than any other one thing we can mention. It is surprising how fast they grow; and when given plenty of room they usually grow even in size. One time in the long ago a man asked me what caused his brown Leghorn chicks to have white blotches on them. He said they hatched all right, but in about two weeks they all had small white patches on the wings, breast, etc. He thought they must be mixed. As he did not live far away I was interested enough to go to his place to see if I could locate the trouble, and I did. It was in the crowded brooder; the chicks were being bruised, they were packed so tight, and after he moved half of them into another brooder the chicks feathered naturally. If these chicks had been white Leghorns the cause would probably never have been found out, as the chicks would have been crowded until they commenced to die and thus make room for those left. Now any other animal on the farm is looked after and given quarters large enough for natural growth; yet farmers neglect the chickens, which in times of poor crops are really the best-paying thing on the farm.

And let me tell you, Mr. Farmer, the egg crop is light this year. Here in Los Angeles eggs have gone up to 28 cents case count; at this time last year they were 25 cents case count. Numbers of small poultrymen have sold off their cocks, and the coming months give promise of being good for the man who has a nice flock of pullets coming on. Don't neglect them. Give them room in the house and plenty of room to run and exercise; they are building up a good, vigorous constitution while they are exercising. Keep them well supplied with litter that they can scratch in to find little tidbits, for there must be something to reward them or the scratching ceases. Look well after the mites in the houses; and where ticks are found, be extra vigilant; plenty of crude oil with about 2 per cent clear carbolic acid crystals is the quickest and surest remedy to spray buildings that are infested with ticks and mites.

Remember to spray the nests. This should be done with white distillate or coal oil and carbolic crystals. If the nests have mites, the hens will lay away any place, the eggs will be dirty and that makes another loss, all coming out of the owner's pocket. This week we are all caught up with the question box, which is quite an institution; and as I am going to make some changes in a short time you should read every line in this department.

Poultry Sex Control.—There are a great many conflicting opinions among breeders on this subject and I suppose every one is entitled to his own. Some people insist that if young cockerels are bred to two-year hens, the progeny will be more pullets; others claim that if a three-year cock is mated to pullets the flock will average two-third pullets and so on, every one going on just guess work and having no sufficient data to fall back on.

Being of an experimental turn I have tried all these methods and a few extras thrown in, and found very little choice in any of them—not enough to make me feel that I had found the plum in the prize package.

The life of a chicken is so short that it is quite difficult to keep much track of a large flock, but it can be done by painstaking care such as the real-fancier is willing to give. I have a friend who claims to tell the sex of the egg by some egg tester, combined with the shape of the egg; it is really funny to see him selling cockerels the way he does from eggs hatched from these "tested" eggs. This year most of his flock are going to market, cockerels.

Now I always prefer mature stock on both sides, not so much because of sex, but because I know the chicks will be stronger and better all ways. The only reason I can see for using cockerels is that they are more active; there is no other reason, in my mind, for the preference. If the hen controls the sex, as some claim, it stands to reason that if cockerels are used in preference to older males there is no economy in it.

We are told that the male is half the flock, but this statement must be modified, because he is only half of the flock when he is hatched from a hen that was strong enough to transmit her own fecundity to, not only her daughters, but her sons. Such a hen is what is termed a "cocky hen"; she has a coarse head, rather broad than long, and her comb is quite large for the breed she represents. A hen of these characteristics will usually lay eggs that will hatch more cockerels than pullets; and if she is a good layer and is well raised, so that health and vigor stand out as prominent features, then her cockerels may well be called "half of any flock" they are mated with.

One thing I have always noticed is that in early spring when both males and hens are fresh the eggs hatch out more cockerels; not just a few more, but at least a third more cockerels than the same yards will hatch later in the season when they have been mated some months. And even though fresh cockerels be supplied the output is still more pullets than cockerels.

Another thing I have noticed and practiced a good deal when hatching eggs for myself was to give a good vigorous male bird nearly twice as many hens as he can take care of, ordinarily. By this method we lose by infertile eggs and by using up hens' time to sit them out; but if two hens are set at one time the eggs can be tested out about the ninth day (that is as soon as it is safe to disturb them), and the eggs can then all be given to one hen and the other

Above all!

Solid merit places Savage Tires and Grafinite Tubes far above all others in the estimation of hundreds of thousands of car owners.

Savage Tires—full sizes, extra plies of fabric, great resiliency and a tough road-gripping tread combined, mean low first cost and big mileage.

Grafinite tubes—pure Para rubber built up layer by layer. The only tubes that have graphite vulcanized into the surface. Friction, heating and sticking eliminated—longer life.

Above all, for the sake of your comfort and pocket-book, say "Savage" when you next buy tires or tubes.

Ask for the name of our distributor near you.

allowed to go back to her business of laying eggs. When selling eggs to others, this method cannot be practiced, but is a good and cheap way to get two-thirds pullets.

Average Price of Eggs.—What is the average price of No. 1 fresh eggs paid the producer, also paid by the consumer?—S. A.

[Taking one week from the sales report of the San Francisco papers for three years we find that the prices varied one cent a dozen, this year's price being one cent below (this during the summer months). For a short time in the early spring when the production exceeds the consumption, prices are much lower; during fall and winter months, prices are up, and it is safe to average the various ups and downs to a 20 cent

price per dozen paid to the producer. What the consumer pays is past my ability to figure; but if he pays cash and buys from a reputable dealer the usual dealer's profit is five cents a dozen. This, however, is considered very little profit, because the price of eggs fluctuates so much that dealers sometimes lose, especially during the spring months when the price is up one day and down the next. It is almost impossible to give correct figures, or even guesses to the last question, for every locality has a rule of its own and some of these are too elastic for the average person to grasp.]

POULTRY NOTES.

[By Geo. H. Croley.]

Fredericks and Rex of Bangor are pleased with the returns from the sale of eggs during December and January last winter. In December 220½ doz. eggs sold for \$90.25. In January, 272½ doz. eggs sold for \$102.75. The eggs were the product of 125 pullets and 80 yearling hens, White Leghorns, that were selected by the Hogan method. The eggs from which these fowls were hatched were purchased of Mr. M. M. Turner of Bangor. This record demonstrates the value of proper selection and scientific care.

Chas. A. Romwell of Petaluma has been devoting some time to the study of white diarrhoea in young chicks. He has discovered that chicks which show no outward signs of bowel disturbance but appear to have been injured by overheating or by chilling, may in reality be infected with white diarrhoea. He has sent a number of chicks, some dead and others alive, to the poultry division of the University Farm at Davis for bacteriological examination. It is possible that Mr. Romwell will soon be able to send us an interesting report on this subject.

As an economical proposition, the University of California recommends feeding fowls a scratch feed composed of a general mixture of grains. Experiments conducted by the Nutrition Division have shown that when a proper and generous mash is fed, one grain is as good as another as far as egg production is concerned. It must be remembered, however, says the University, that a sudden change in the feeding cannot be profitably made, but change must be brought about gradually. Hence the benefit of accustoming the fowls to a mixture of grains. Then the predominating one can be that which is the lowest in price.

A valuable poultry and stock food that may be raised on rough waste land is promised the California feeders by Professor I. J. Condit. The carob, or locust bean, tree is one of the new varieties of semi-tropical foods with which Professor Condit has been experimenting, and as a result of his studies finds that this bean, which is an important product of southern Europe, grows even on the rough hillsides of California. The bean, or St. John's bread, as it is popularly called, furnishes excellent food for poultry, horses and domestic animals. The results of Professor Condit's investigations are given in his new correspondence course of fifteen lessons in citriculture, which is given free by the department of agriculture of the University of California.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

NO BABY CHICKS DURING JULY.—Fall hatching starts in August. Get in touch with us immediately, and assure chicks when you want them. Ask for special "Fall Chick" circular. White and Brown Leghorns, Barred Rocks, R. I. Reds, and Black Minorcas. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each. 2 Electric Incubators, 144 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Volden, Box 396, Los Gatos, Cal.

MAKE AN EARLY START with your Fall chicks and get them right now. We have Baby chicks as well as chicks one and two weeks old with price same as baby chicks. No weak ones. All strong chicks—all varieties. Santa Clara Valley Hatchery, San Jose, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

DAY-OLD CHICKS.—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

BABY CHICKS AND EGGS.—Hoganzed Black Minorcas, White Leghorn, stock specialties. Free instructions on raising chicks. Hicks Jubilee Hatchery, Petaluma.

Patrick Henry Addressing the First Continental Congress, Philadelphia, 1774

One Nation; One People

WHEN Patrick Henry declared that oppression had effaced the boundaries of the several colonies, he voiced the spirit of the First Continental Congress.

In the crisis, the colonies were willing to unite for their common safety, but at that time the people could not immediately act as a whole, because it took so long for news to travel from colony to colony.

The early handicaps of distance and delay were greatly reduced and direct communication was established between communities with the coming of the railroads and the telegraph. They connected places. The telephone connects persons irrespective of place. The telephone system has provided the means of individual communication which

brings into one national family, so to speak, the whole people.

Country wide in its scope, the Bell System carries the spoken word from person to person anywhere, annihilating both time and distance.

The people have become so absolutely unified by means of the facilities for transportation and communication that in any crisis they can decide as a united people and act simultaneously, wherever the location of the seat of government.

In the early days, the capital was moved from place to place, because of sectional rivalry, but today Independence Hall is a symbol of union, revered alike in Philadelphia and the most distant American city.

MRS. BEST'S LETTER.

My dear Friends:

So swiftly do the seasons roll by that although we are in the midst of summer weather, the shop windows are full of winter millinery, furs, and fall suits. The ever-popular, black velvet sailor is here, but trimmed in an entirely new and novel fashion with wool yarn. One that I saw had the entire crown covered in a criss-cross design of different colors, while another had a rose with long stem worked on the brim and still another a long and short stitch running entirely around the brim. If the hats are not large, they are quite small, in toque shapes and many of those are trimmed in breasts and wings, so if you have any left-overs of that sort, you are fortunate. Soft, white plush hats with satin bands are distinctly new, but I think they are a mid-season style and will probably not last into the winter.

Many of the furs are in the same design as they were last year, the skin of the entire animal being used and worn across the shoulder, but one new design in a white fur was in the shape of a sailor collar and fastened at the throat in front by ribbons. This was very new looking and was worn at one of the college dances in place of a scarf of lace. By the way, scarfs like our grandmothers wore have supplanted the light chiffon ones that have been so popular.

The new waists both in silk and wash materials are very much more frilly than they have been—large revers down the front of the waist and large collars, many times edged with lace, make the waists seem more dressy than the plain tailored ones we have been wearing. Some of the fine lingerie waists with their fine tucks and dainty lace are wonderfully pretty and equally high-priced.

There are many pretty separate collars being worn, some suitable for tailor suits and others intended to give a finish to a voile or dimity dress. These dresses are many of them very simply made, with full skirt with applied folds or ruffles and simple surplice waist and girdle. The bordered materials are made with a double flounce skirt.

Another old-fashioned article that has re-appeared is the beaded bag. You see them in black, white and a combination of colors and also plain black silk bags with designs worked on the sides in beads. For dressy use, the silk bag seems to be better style than the leather.

Bags for fancy work are just as popular as ever and now you can pick up beautiful remnants in ribbons for one-half the original price. It would be a good time to buy for Christmas presents, for later in the year, all ribbons go back to their first price.

Another thing I noticed for substantial savings were materials for sofa pillows in cretonnes and linen weaves as well as the velours that in short lengths were only a fraction of their first price.

This store had many sample sofa pillows on exhibition and the large square sofa pillow is a thing of the

WHERE THE DANDELIONS WENT.

Three little dandelions, each in yellow gown,
Stood beside the winding road that led to Londontown.
They heard the merry children, they saw the travellers pass,
And they said to one another, "How sad it is, alas!
That we, too, may not travel and view the world beyond;
We've never even climbed the hill or seen across the pond."

Three little dandelions, each in gown of gold,
Taller grew each summer day in the leafy mould,
Yet they stood on tiptoe and peered through sun and rain,
To see if it was England that lay beyond, or Spain.
One said she saw chimneys, and another smoke and soot,
While the third saw ships a-sailing, but they never moved a foot.

Three little dandelions, each in gown of white,
Laid their plans to travel on a dewy night,
And, while cooling breezes fanned the waking day,
Spread their wings and vanished, oh, so far away!
But, if they reached that smoky town or the seashore as they meant,
I'm sure I'll never tell you, for I don't know where they went.

—Gussie Packard Du Bois, in Los Angeles Times.

past. These pillows were circular, or oblong and were made with cordings and shirred pieces set between circular sides. The materials were not expensive, mostly cretonnes, but the effects were beautiful.

Cretonne is being used not only for bedroom hangings but to make dresser and bureau scarfs as well, and to cover boxes for toilet articles. Yours devotedly, Rosabella Best.

SUNDAY EVENING TEA.

A very pleasant and inexpensive way to entertain the friends of the young people of your household is to give a Sunday evening tea. If you have small tables, it adds to the informality to serve the tea in the living room and the extra distance for the food to be carried is of no consequence, as the young men will attend to that.

A simple meal of hot biscuits or rolls, with jelly or jam, a salad or cream dish, with fruit and cake, with hot or cold tea—depending on the weather—is sufficient, or if you prefer, serve hot buttered toast with marmalade, a welsh rarebit and a gelatine pudding with whipped cream. Keep your refreshments simple and let the young people wait upon themselves, so that they feel thoroughly at home.

After the meal, story telling and singing will help pass a pleasant evening, and having arrived early, they can leave early, thus not interfering with the rest necessary for the next day's tasks.

ECONOMY IN OLIVE OIL.

If your household is fond of mayonnaise, try using salad oil with a small amount of olive oil added—the expense is very much less and the flavor is good.

TEA NAPKINS.

Plain linen finished with a crocheted picot edge is very good style now for tea napkins.

STRAWBERRY CUSTARD.

Make boiled custard with one quart milk, beaten yolks of four eggs, half cup sugar, half teaspoon vanilla. Crush and strain one pint ripe berries, mix with them half cup powdered sugar, then gradually beat this into the stiffly whipped whites of four eggs. Serve the custard in glass cups and pile the strawberry float on top.

FLORAL DEPARTMENT.

By Geo. N. Tyler.

Roses should be dried off this and next month (August). Do not give them any more water till first of September, and before watering, prune back all weak wood, and then put on some bone meal—one pound to the square yard and work it in to the top soil, then put on about one and one-half inches of half-rotted manure from which the heat has gone out. You can water through this manure, and be sure and spray the tops two or three times a day so they will break and make new wood. You will get a fine crop of flowers in October and November, for here in California we have practically two springs.

I would also advise drying off Pelargoniums (Lady Washington geraniums) where they are planted in the ground. You can then prune them back heavily the first of September, and they will make new breaks and the growth will be hard and more able to withstand frost. If you don't dry them off and keep them in a growing condition all the time, they will make soft, tender growth that is very susceptible to cold and frost and they are liable to be cut clear to the root.

Violets that were planted out in early spring are now in strong growth and are beginning to send out runners; keep these picked off or you won't get any early flowers. Keep them well watered and in a growing condition all the time.

Amaryllis will soon be in bloom, so water the place where the bulbs are planted, and they will soon throw up the flowering stalks. If you want to move any, or transplant them, you can do it as soon as they have thrown up the flower stalk, cut off the flower and transplant. The amaryllis is very impatient of being moved and it is the only time of year that you can move them and have them bloom the following year. If moved at any other time they will not bloom for sometimes two or three years.

I have a fernery that is about forty feet long and eight feet wide. There are forty-two varieties of ferns growing in it and about five hundred plants. The varieties are the native ferns and what domestic ferns that stand the frost. I have been asked by a lady to give my method of building and a list of the varieties that are in it that are hardy. I had a number of other varieties, but last winter's frost killed a good many of them and I have cut the list down to what I am now growing and which are perfectly hardy. I will discuss them in my next article.

POTATOES BAKED IN HALF-SHELLS.

Bake a sufficient number of medium sized potatoes. Remove from oven, cut slice from top of each, and scoop out inside. Mash and add two tablespoons butter, salt, pepper, and three tablespoons hot milk; then add whites of two eggs beaten until stiff. Refill skins with mixture and bake from five to eight minutes in very hot oven.

TIMELY TOMATO RECIPES.

Napoli Tomatoes.—Wipe and remove stem end from tomatoes. Scrape out most of the pulp with a spoon. Sprinkle inside with salt and invert and drain for half an hour. Mix well-cooked macaroni with one-half cup of grated cheese and one-half the removed tomato pulp and salt and pepper to taste. Fill the tomatoes with this mixture, sprinkle with bread crumbs and bake twenty minutes.

Fried Tomatoes.—Cut tomatoes in halves crosswise and cut off a thin slice from rounding part of each half. Sprinkle with salt and pepper, dip in crumbs, eggs and crumbs again, place in a well-buttered frying pan and cook for about ten minutes.

Tomato Salad.—Scald and peel tomatoes of even size—cool and place on lettuce leaf. With sharp knife, make two cuts across at right angles about half through the tomatoes. In these openings place cucumber slices and a little chopped celery on top. A generous spoonful of mayonnaise with a dash of paprika completes a very simple but attractive salad.

CARE OF THE TEETH.

Statistics prove that over fifty per cent of the children in the public schools have defective teeth. Mothers should be awake to the value of good teeth and the necessity of care for them. Early training in the use of the toothbrush and regular visits to a dentist should be insisted upon. Care in the early part of one's life will lay the foundation for strong, permanent teeth.

GIVE THE BABY A CHANCE.

The U. S. Public Health Service has a Bulletin ready for distribution on "The Summer Care of Infants," that will be sent free of charge to all applicants. All mothers of small children should take advantage of this offer.

HOW THEY CAMPED OUT.

Pound, pound, thump, thump! A little camp was being made in the hemlock grove half-way up the hill, while two excited little boys watched the preparations and did their best to help. What joy to sleep on a bed of fragrant, springy boughs, while the cool night wind blew round them! They could hardly wait for the time to come.

You see, father and Uncle Frank had just returned from a camping trip in the Adirondacks, and as soon as Dick and his boy friend, Tom White, heard the delightful experiences they were most anxious to have a camp of their own, and sleep in the big out-of-doors, far from any cottage. Mother herself made them some warm woolen sleeping-bags, that were to be drawn up to the sun-burned necks, leaving out only the curly heads.

That same evening Uncle Frank walked to the camp with the little boys, to see that they were comfortably fixed for the night. He spread the spicy boughs evenly, gave a final pat to the wooly bags, and, blowing out the lantern, left them with only the bright, far-off stars to watch over two happy little lads.

Presently something stirred lightly the green carpet; a soft sound broke the stillness not unlike a baby brook singing over the pebbles. Then it became a plain purr, and, behold! there were three campers. It was the black kitten, which had followed Uncle Frank from the cottage, and now settled down very comfortably between the sleeping-bags, not meaning, evidently, to desert his two good friends.

Did they lie awake long, listening to the noises of the wood? I think not, for the very first thing they knew it was daylight, and the east was brightening with the glory of sunrise. They straightway hurried to their separate cottages, where they awakened their sleepy friends to tell them they had slept splendidly, and wanted to spend "most every night" out of doors.

Sure enough, the very next evening, soon after sunset, two little figures might have been seen making their way up the hill toward the woods.

"Pooh!" said Dick, in a very big voice, "I don't care if Uncle Frank couldn't come with us to-night. I guess we know everything about camping by this time."

"Oh, yes," replied Tom, as he strode along, swinging his lantern.

"I'm sure there aren't any strange animals in these woods."

"Tom," continued Dick boldly, "it takes a good deal to frighten me. You couldn't tell me a story that would make me afraid. When I was eight, last summer, I wouldn't have come way up here to sleep. You see, I'm nine now."

Longer grew the shadows. The lights began to twinkle in the cottages at the foot of the hill. The little camp became strangely quiet; it had grown quite dark. In the silence the two boys crept into their sleeping-bags. Queer how different the camp looked by night! In the bright sunshine this morning it seemed so very near home: now there was such a long, dark space between their friends and themselves.

"I keep thinking, Tom," said Dick, "about that book I had for Christmas, 'Wild Animals I have known,'—some kind of frightening stories in there. Do you own that book?"

No answer from the little form at his side. Tom had fallen asleep, to dream, perhaps of wild animals he did not want to know. Oh, would he himself ever go to sleep? Dick shut his brown eyes tightly and listened to the lonely murmur of the wind in the trees.

Well, it would be morning very soon. They must have been in bed hours already. What was his mother doing? Perhaps thinking of her little boy—perhaps. A strange choking feeling came into Dick's throat. He turned and shook Tom vigorously.

"Tom," he said in an uncertain voice, "Tom, I don't feel good, I don't. I've got a queer pain in my chest, and when I have it I must always see my mother."

"Is it very bad?" asked Tom's sleepy voice.

"Awful!" in a hoarse whisper. "I'm going home."

"So am I, then," chimed in the other bold camper. Hastily pulling off the sleeping-bags and pulling on sweaters, they lighted the big tin lantern, and were soon stumbling over sticks and stones on their homeward way. They separated at the grassy lane, Tom turning in, and Dick, minus the lantern, keeping on down to his cottage.

Softly opening the front door, he entered the hall. But what did this mean? The living-room was lighted! Was baby sick? And there sat mother, reading by the open fire, looking dearer than ever in her pretty white gown.

"Why, my little camper!" she exclaimed. "Home again?" And Dick, with both sturdy arms round her, told her all.

O wise mother! O understanding mother! How comforting to a small son to learn that she had been thinking and wishing for him just at the time that he had been thinking and wishing for her! It was well that he came back to this lonely little mother of his.

Just as she tucked him up in his own soft bed Dick opened drowsy eyes to ask:

"And isn't it most morning, mother?" And, smiling, mother answered:

"No, dear, no. It's nearly nine o'clock."—Alix Thorn.

Pacific Rural Press Market Report

PRICES QUOTED
AS PAID TO
PRODUCERS

San Francisco, July 26, 1916.

WHEAT.

Buyers are beginning to take more active interest, and market is stiffening up on both local and northern grain. Sonora is scarce and advanced sharply; both northern and California club and bluestem have been marked up.

Sonora Wheat \$1.77½ @ 1.80
Northern Club 1.75 @ 1.77½
Calif. Club, ctt. 1.72½ @ 1.75
Northern Bluestem. 1.85 @ 1.87½
Northern Red 1.80 @ 1.90

BARLEY.

Both spot and future barley shows some strength. Shipping barley in good demand, both in East and Europe; while none is moving foreign by sea as yet, prices have been marked up sharply. With a light crop, the advance is reflected in feed. Shipping, ctt. \$1.50 @ 1.52½
Choice Feed, ctt. 1.45 @ 1.47½

OATS.

Offerings of all grades are light, with buying movement broadening prices continue to advance. Both red and white feed slightly higher, red seed beginning to move. Black seed also receiving some attention, and held at stiff prices.

Red Feed \$1.65 @ 1.75
Red Seed 1.80 @ 1.90
White 1.62½ @ 1.65
Black seed 2.50 @ 3.00

CORN.

Stocks of corn in the East are rapidly decreasing, and advance there is reflected in local market. Not enough California yellow left to quote, but Egyptian and the other sorghum grains are bringing better prices.

Eastern Yellow, ctt. \$1.90 @ 1.95
Milo Maize 1.45 @ 1.50
Egyptian 1.60 @ 1.65

BEANS.

No quotable change is noted this week, though some fluctuation is likely to occur. At present all lines are fairly firm, with stocks at an unusually low level; but high prices have held demand down very closely, and it is not certain that this level can be held through the rest of season. It will be some time before new beans are offered, however, the outlook is favorable for firm market. It is too early to forecast coming crop, and Association prices on limas will not be made until Sept. 1; though the high range now prevailing cannot be expected to hold when new crop comes in.

(On wharf, San Francisco.)

Bayos, per ctt. \$6.25 @ 6.50
Blackeyes 3.50 @ 3.75
Cranberry Beans 5.75 @ 6.00
Horse Beans 3.25 @ 3.40
Small Whites (south) . 9.75 @ 11.00
Large Whites 8.75 @ 9.00
Pinks 6.75 @ 6.90
Limas (south) 6.00 @ 6.50
Red Kidney 8.00
Mexican Reds 5.50 @ 5.60
Tepary Beans 4.50 @ 4.75

HAY.

Local hay prices are gradually advancing, showing that views of some growers were partially justified, and the fact is realized by local buyers. No. 1 grade of wheat hay has jumped \$1 per ton, with advances in the top figures on No. 2 wheat, wild oats, barley and stock hay. Arrivals are increasing, as there is no longer trouble in handling river shipments a great deal of the river alfalfa is coming in. Dealers report car shortage hampering shipments and all arrivals sold readily, indicating that buyers are disposed to put in supplies. A serious shortage is reported in Nevada, which will tend to stiffen this market.

Wheat, No. 1 \$13.00 @ 14.50
No. 2 10.00 @ 12.00
Tame Oats 11.50 @ 15.00
Wild Oats 10.50 @ 13.00
Barley 10.50 @ 13.00
Alfalfa 10.00 @ 14.50
Stock Hay 8.50 @ 9.50
Straw, per bale35 @ .50

FEEDSTUFFS.

Advance in grain and hay is re-

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., July 24, 1916.

This week's shipments will practically complete the shipping season from the Sacramento river district.

The movement of Elberta peaches at this writing is at its height, both in the San Joaquin valley and Placer county, but practically all of this variety will have been shipped by the 29th.

Late plums are now moving and the shipment will also be completed by the end of the week.

The late pear crop is light and some shipments are now going forward.

A few crates of Tokays have been shipped, the berries showing a sugar test of 20 per cent. Malagas and Thompson Seedless are also en route East and the movement on the former variety will be very heavy within a week. We do not look, however, for the bulk of the Tokays to move before the middle of August.

The Bartlett pear movement east has been exceptionally heavy, considerably more so than was anticipated earlier in the season, but all markets have held up remarkably well under heavy offerings.

Competition from eastern states has not been as keen as expected due in a great measure to the unseasonable weather during the picking sea-

son in Georgia. The Georgia shipments are on the decline, having been at their height last week. Some competition will be felt from New Jersey, Delaware and Maryland during next two weeks.

The Wisconsin, Michigan and New York grape crops are not over 60 per cent, and this situation, together with the light pear crop in the Northwest and New York State, indicates that our grape market will be in good shape throughout.

Tokays have been damaged to considerable extent during the recent hot spell and it is conservatively estimated that the crop will be less than 50 per cent of normal. Malagas are normal and likewise Emperors.

The following prices have ruled for the week:

New York.—Bartlett pears averaged \$2.16; Wickson plums, \$1.47; Diamond \$1.60; Duke \$1.68; Giant \$1.30; Burbank \$1.10; German \$1.65; Tuscan peaches \$1.10; Crawford 73c; Decker 86c; Elbertas 80c; Malaga grapes \$1.96.

Chicago.—Bartlett pears \$1.96; Wickson plums \$1.38; Giant \$1.37; Sugar \$1.47; Burbank \$1.37; Duke \$1.54; Egg \$1.20; Diamond \$1.71; Malaga grapes \$1.80; Muscat \$1.79; Crawford peaches 79c; Tuscan 90c.

Total shipments to date, July 24, 4914 cars; total shipments same date 1915, 3371 cars.

POTATOES AND ONIONS.

Delta and Southern potatoes continue firm, with light supplies and some shipping inquiry; some off-grade stock is offered at a reduction. The new crop of yellow onions now coming in good shape and another decline is noted.

(On wharf.)

Potatoes, ctt., Delta ... \$1.50 @ 2.00
No. 2 1.00 @ 1.50
Southern 2.00 @ 2.25
Onions, yellow 1.25 @ 1.50
Garlic, new crop, per lb ... 4 @ 5c

POULTRY.

Arrivals from East have been moderate, but there is plenty of local stock offered, and with slow demand values are easier. Broilers are weak, and fryers have been marked down. Broilers, 18 lbs. to doz. and

less, lb 20 @ 21c
do, over 18 lbs to doz .. 20 @ 21c
Fryers 20 @ 21c
Hens, extra, per lb. 17 @ 18c
Small 16c

Smooth Young Roosters, per lb. 23 @ 25c
Squabs, per doz. 2.00 @ 3.50
Geese, per pair 2.25 @ 3.00
Ducks 13 @ 14c
Old 12 @ 13c
Belgian Hares 7 @ 9c

BUTTER.

Market is uninteresting now. All grades have gained ½c over last week's level, no change has occurred during most of the week, with supply and demand about even.

Thu. Fri. Sat. Mon. Tu. Wed.
Extra 26½ 26 — 26 26 26
Prime Firsts 25½ 25½ — 25½ 25½ 25½
Firsts 25½ 25½ — 25½ 25½ 25½

EGGS.

Closing price of last week has been maintained, a cent's advance Monday bringing in so much stock that gain was lost the following day. The

week's average is now about 3c higher than last year; with production likely to fall off from now on, no important drop is expected.

Thurs. Fri. Sat. Mon. Tu. Wed.
Extras 28 28 — 29 28 28
Sol. Pullets 25½ 25½ — 26½ 26 26

CHEESE.

Flats have regained half-cent lost last week, Y. A.'s standing as before; Monterey cheese is easy, off-grade lots bringing even less than quotations.

DECIDUOUS FRUITS.

Berry market has eased off, except on Logans, which are slightly higher; strawberries, blackberries and currants being quite cheap. Huckleberries coming in with some regularity, but prices still rather high. Top price of Gravenstein and Alexander apples a little easier. There is a strong demand for early apples for England, Australia and South America, but shipping rates are practically prohibitive; the domestic demand keeps values fairly firm. Bartlett pears are in good demand, but local offerings are easier, with a good deal of ripe stock. Apricots firm, with a strong canning demand, and the crop is over in several districts; peaches show wide range, a great deal of off-grade stock being cheap. Figs are quite firm, prices well maintained on better offerings of plums and prunes; nectarines are dull and easy. Cantaloupes and watermelons are coming in freely from Valley points, lower prices prevail. Grapes remain firm.

Huckleberries, lb 12½ @ 15c
Currants, chest \$3.00 @ 4.00
Loganberries, chest 4.00 @ 5.00
Blackberries, chest 2.00 @ 3.00
Raspberries, chest 5.00 @ 7.00
Strawberries, chest 4.00 @ 5.00

crate 1.25 @ 1.50
Watermelon, doz 1.75 @ 3.00
Grapes, Thompson, small bx .75 @ 1.00
Fontainebleau, crate 1.25

DRIED FRUITS.

The market remains in about the same quiet condition as last week, except the dullness is more widespread than before. Packers say that Eastern buyers are taking practically no interest, and the prospect of a railroad strike and other labor troubles has checked business to a great extent. Packers have accordingly made a further reduction in offers for prunes of either old or new crop, 5c being about the top. Top figure on apples also reduced slightly, and there is little movement of new apples. The reluctance of Eastern trade to buy has so far had no influence on most of the growers, and there seems to be no reason to force fruit on the market. Growers of apricots appear to be justified in holding, there is nothing to indicate values will be lower for any extended period, though it may be some time before any advance is realized. Figs remain firm and scarce, peaches are quite steady. Raisin situation strong.

Apples, old crop 7 c
Apricots, per lb, 1916 12 @ 13 c
Figs, white, 1916 6½ @ 6½ c
Black, 1916 5 @ 5½ c
Caltmyrna, 1916 9 @ 10 c
Prunes, 4-size basis, 1915 5 c

Special Livestock Market Report.

No change in prices can be quoted on any class of livestock or wool.

Cattle.—There are plenty of cattle to supply all demands at least until fall.

Hogs.—It seems like everybody wants to get rid of their pigs without feeding them. The quality of receipts is poorest yet. Many people are shipping 100 pounders off from alfalfa, unfinished and soft. It would be a good time to get feeder stock, as

the demand continues to be for 175 to 225 pound hogs. Hot weather makes consumption low at this season anyway.

Sheep.—Consumption is low at present prices and will probably continue so, at least until cold weather.

Wool.—No material change and nothing outstanding in any of the foreign or domestic markets. Defective wools are dragging even more than usual.

1916 5 c
Peaches, old 5 @ 5 1/2 c

cases, per lb 8 3/4 c
Sultanas, 50-lb. cases, per lb . 8 c

CITRUS FRUITS.
The lemon growers are now having their innings. The hot weather in the east and the scarcity of hold-over stock is causing prices to soar. Valencia oranges are also bringing good prices and prospects for the rest of the season are good.
At New York on Monday, July 24, the citrus auction averaged for valencias from \$2.80 to \$5.10 per box, and for lemons \$4.70 to \$6.30. At Boston the same day oranges averaged from \$3.65 to \$4, and lemons brought as high as \$8 per box. About 80 cars of oranges and 45 cars of lemons are being sent east daily.
Hot weather throughout the country has caused an extremely heavy demand for oranges, lemons and grapefruit, the two former have steadily advanced at shipping points. Lemons have been marked up to ex-

treme prices in local market, while oranges are going up less rapidly, there is considerable stock here, bought before the advance.
Oranges, Valencias \$3.00 @ 3.75
Grapefruit 2.00 @ 3.00
Lemons, box 3.00 @ 7.00
Lemonettes, box 2.00 @ 3.00
HONEY.
There is a good demand for honey, as arrivals have been light, most of the dealers would be glad to get more stock. Prices are well maintained.
Water White, comb 13 @ 15 c
Amber 10 @ 12 c
Water White, extracted .. 8 @ 9 c
Light Amber, new 6 @ 7 c
Dark 3 1/2 @ 4 c

NUTS.
Almonds remain quiet, with few growers showing anxiety to sell in advance. There is good demand for new crop.
(Prices offered by packers.)
Almonds, 1916:
Nonpareils, lb 17 1/2 c
I. X. L. 15 c
Drakes 13 c

HORSES.
Considerable buying is still being done for American and foreign army requirements, but dealers state that that is the only real activity. No new offerings worth mentioning have appeared in the local market this week, and that is just as well, as buyers are taking no interest, difficulty being experienced in moving anything at satisfactory prices. Values in the country are well maintained, there is apparently enough demand at outside points to justify prices asked.
(Approximate values in San Francisco, based on auction sales.)
Drafters, 1700 lbs and up \$ 250
Drafters, 1550 to 1650 .. 150 @ 200

HOPS.
The market is extremely quiet at present, with practically nothing doing in new-crop hops, for which growers are asking 11c. Old Sacramento hops are held at 8 to 9c, Mendocino and Oregon at 9 to 11c, but there is very little demand. There is said to be 10,000 bales left in Sacramento district, 4,000 to 5,000 in Sonoma, etc., and 7,000 to 8,000 in Oregon.
Sacramento, 1915 8 @ 9c
Mendocino, 1915 9 @ 11c
Oregon, 1915 9 @ 11c

GROCERIES.
Sugar is very firm, prices having stood for some time at \$8.30, granulated basis, for cane and \$8.10 for beet dry granulated from refiners. Flour is quiet, but firm at the old

California Almond Growers' Exchange has met every obligation, weathered every storm and has held fast to those teachings which stand for honesty and square dealing in business.

Its original membership six years ago was 230. The net increase in membership since the 1915 crop is 267, making a total membership of 1086 growers.

Every almond grower is urged to join the Association and give it greater strength in developing and protecting the industry.

California Almond Growers' Exchange

SAN FRANCISCO, CAL.

level of \$6.40 to \$6.80 for family extra. Pacific codfish shows a further advance of 1/4 c per lb. An advance is expected in canned meats.

Publisher's Department

GOOD AS AN ENCYCLOPEDIA.
I have been reading Prof. Wickson's latest book, the "Second Thousand Questions," and find it so good that I feel you all ought to know about it and get a copy. It is like having an encyclopedia in the house. A short time ago, I hired a man to come out and bud some almonds on peach trees for me. He said it could not be done, as the one was a nut, the other a fruit. Now I let him bunco me with that; but a few days later found the answer in "One Thousand Questions," and he got orders to come back and do the work. This book is good, take my word for it; there are answers to almost every

question the farmer runs up against.
Susan Swaysgood.

In an address before the Advertising Clubs at Baltimore, G. B. Sharpe, advertising manager of the De Laval Separator Co., said: "As one of the largest buyers of farm advertising in the country, the first thing I want to know about a farm paper is not its circulation, but the service it is rendering its readers through its editorial columns. The next thing is, does it exclude objectionable advertising, then whether the paper sells to its subscribers on merit or is given away through premiums for nothing. A statement in a publication that deserves the farmers' confidence has vastly more weight than in a paper that has no standing with its subscribers."

One hundred and seventy-six new subscribers were added to our list during the past week.

Compare the Cost

TWENTY years ago a farmer borrowed \$1,000.00 at 6 per cent straight on the old fashioned loan plan. He has renewed the loan at intervals with constant expense of renewal commissions, abstract charges and recorder's fees, and he still owes the principal sum of \$1,000.00

He has paid \$60.00 interest every year for 20 years, a total of 1,200.00

Total cost to farmer, including \$1,000 still unpaid.....\$2,200.00

Under the amortized rural credit plan, his total interest and principal payment would be \$90.76 a year for 20 years, or..... 1,815.20

A saving on a loan of \$1,000 of.....\$ 384.80

The following table shows the amount of INTEREST SAVED by borrowing on the amortized or rural credit plan:

Amount Borrowed.	Annual Payment Amortized Loan.	Total Payments. 20 Years.	Straight 6 per cent for 20 years and Principal Repaid.	Interest Saving Amort. Loan.
\$ 1,000	\$ 90.76	\$ 1,815.20	\$ 2,200.00	\$ 384.80
2,000	181.51	3,630.20	4,400.00	769.60
4,000	363.02	7,260.40	8,800.00	1,539.60
8,000	726.05	14,521.00	17,600.00	3,079.60
10,000	907.56	18,151.20	22,000.00	3,848.80

We think this amortized loan which can be paid off any time is the best loan, for the farmer, being offered in California, but if preferred, will make 10 year loans, annual interest and favorable prepayment options. Both types, each being for a long term, offer a big advantage in selling a farm, for each gives buyer longer time to pay out than sellers or other loan companies generally grant.

Full information given on request without obligation to borrow.

Bumper Grain Crops Good Markets — High Prices

Prizes Awarded to Western Canada for
Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer.

In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription.

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Gov't Agt., Canadian Bldg., Exhibition Grounds, San Diego, Cal.

HOW ABOUT CROPS THIS SUMMER?

Proper irrigation will more than double your crops—ask your neighbor who has tried it.

Electric motor-driven pumps will solve any irrigation problem. They need no attendant, deliver water steadily day and night and cost but little to operate. Insist on a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

to do your pumping. It will pay for itself in a short time in bigger crops, perfect satisfaction and low upkeep.

A G-E portable motor can be used to drive various farm machinery, greatly reducing your labor bills and insuring you against scarcity of "help".

Your local power company will gladly tell you what G-E motors can do for you; or write our nearest office for booklet No. 3166 on electric farming—the request will place you under no obligation.

General Electric Company

Los Angeles Office:
124 West 4th Street

San Francisco Office:
Rialto Building

The General Electric Company will gladly answer all questions relating to the use of electric power for ranch and market garden irrigation.

Address nearest office

NO ICE MICE OR RATS EXPENSE MOULD OR DECAY

SPARK AUTOMATIC COOLER

A practical household necessity. No family should be without one. Will pay for itself in one season. Butter, Milk, Eggs, Fruit, Meat, Vegetables, can be kept cool, sanitary, in the hottest weather. Constructed of heavy galvanized iron—does not absorb moisture like wood and becomes foul lined with germs. Inside is lined with heavy galvanized wire mesh—keeps out mice and rats. Covered with heavy brown leather—easily replaced. Heavy reinforced wire shelves—thoroughly sanitary. Made in 3 sizes. Send for Descriptive Circular.

LOS ANGELES

Rules and Prizes, State Cow Competition.

Cows which are not purebreds will compete among themselves only, for cash prizes of \$1995, seven purebred bull calves of four breeds and \$100 worth besides, five separators, and three trophies. The total additional prizes for purebreds, grades, and common cows will be \$2740 cash, two milking machines, 1 separator, 15 tons dried beet pulp, and six trophies and medals. At least one creamery company will pay half of the expense of testing by patrons. But the prizes are of far less value than the discovery of cows which do not pay their keep, and the feeds which produce most economical profits. Contest conducted by University of California.

[By Prof. F. W. Woll, in charge of dairy tests, University Farm, Davis.]

RULES.—Any cow owned by a resident of the State of California may be entered in the competition.

The awards of the prizes offered in the competition, except as otherwise given, shall be made on the basis of the production of butterfat during a period of ten consecutive months, as determined by the system of semi-official testing of dairy cows.

Cows entered in the competition shall be tested for two days of every month, as arranged for by the rules governing semi-official yearly tests in this State. Grade cows may, however, be tested for only one day each month, if desired.

In order not to place young animals at a handicap in the award of prizes, the records for production actually made by cows under five years of age shall be increased in accordance with the average results obtained in authenticated yearly tests of cows of different ages, as follows: Records made by cows under 2½ years at the beginning of the test shall be increased by 30 per cent; 2½ to 3 years old, by 24 per cent; 3 to 3½ years, by 18 per cent; 3½ to 4 years, by 15 per cent; 4 to 4½ years, by 8 per cent, and 4½ to 5 years, by 5 per cent.

The owner shall furnish a correct monthly statement of the amount of milk produced by cows entered in the competition and of the kinds and amounts of the different feeds eaten by them. Blanks for reporting milk yields and the feed eaten will be furnished free of charge for this purpose. Milk records calculated from the data obtained in the monthly tests may be used, at the option of the Experiment Station authorities, for arriving at the production of the cows, in the place of those reported by the owners or where regular milk records are not kept by the owner.

Records of production for the competition may begin on the fifth day after calving and shall close ten months from the date of the beginning of the test. A cow will not, as a rule, be tested prior to the fourteenth day from freshening. When an official test of a cow in the competition, of seven days' duration or longer is conducted during a month, the average fat content for this period shall be used for the calculation of the production of butterfat by the cow during that month.

Failure to get a cow in calf before the end of the fifth month after calving shall bar her from competing for any but the monthly prizes and the trophies offered by the various breed associations.

The cost of the monthly two-day tests conducted in connection with the competition shall be \$7.50 for each farmer, and that of one-day tests of grade cows, \$5. This cost includes all direct expenses of the tests to farmers, except room and board of the supervisors while on duty, and

transportation to and from the nearest railway station or ranch where tests are conducted.

The maximum number of cows in a herd that may be tested at one time shall be fifteen if the cows are milked twice a day; ten if any are milked three times a day; and eight if any are milked four times a day. No cow entered in the competition shall be milked more than four times a day, and this number of times only when yielding over 60 pounds of milk per day.

The maximum amount of prize money paid to any one breeder (exclusive of monthly and special prizes) shall be \$500. Prizes shall only be awarded to the bona fide owner of a cow at the time her record is completed. Only records of production of 365 pounds of butterfat or more by purebred cows for ten months shall be considered in the award of cash prizes.

Where a choice of two or more prizes is offered, the highest production shall entitle the owner to first choice, the next highest to second choice, etc., in the order of decreasing production.

What is a Grade?—In the award of prizes to be made in the competition, it shall be considered that a grade cow is the progeny of a purebred bull and a grade or common cow, and that a common or "scrub" cow is the progeny of a "scrub" or grade bull.

All questions not covered by the preceding rules or by the rules governing the semi-official tests in this state, shall be decided by the Chief of the Division of Animal Husbandry in the College of Agriculture of the University of California, whose decision shall be final.

Applications for entry in the competition may be made any time prior to May 1, 1917, when the entries will close. Records of production may commence on November 1, 1916, and prizes will be awarded for records for ten consecutive months made prior to March 1, 1918. Entry blanks and further information concerning the competition will be furnished upon request. Address, Professor F. W. Woll, in charge of dairy tests, University Farm, Davis, California.

Prizes and Contributors.—The general cash prize fund is contributed by: Alexander and Kellogg, Suisun; Mrs. Anita M. Baldwin, Santa Anita; Balfour, Guthrie & Co., San Francisco; "Calf-Way" Milker Co., San Francisco; California Central Creameries, San Francisco; De Laval Separator Co., New York City, New York; W. H. Dupee, Santee; J. S. Gibson Co., Williams; F. M. Helm, Fresno; Miss M. M. Holdridge, Modesto; Larowe Milling Co., Los Angeles; Millbrae Dairy, Millbrae; A. W. Morris & Sons Corp., Woodland; B. E. Nixon, Yountville; Pacific Dairy Review, San Francisco; Palo Alto Stock Farm, Palo Alto; Sacramento Clearing House, Sacramento; Somers & Co., San Francisco; Sperry Flour Mills, Stockton; State Holstein Breeders' Association, Chino; State Jersey Breeders' Association, Stockton; F. Stenzel, San Lorenzo; Western Creameries Co., San Francisco; G. W. Wilder, Redlands.

It will be awarded as follows:

Herd Prizes.—For the highest production of butterfat by ten cows in a herd during ten consecutive months:

	1st Prize	2nd Prize	3rd Prize	4th Prize
(a) Jerseys or Guernseys	\$300.00	\$200.00	\$100.00	\$50.00
(b) Holsteins	300.00	200.00	100.00	50.00
(c) Grades and other cows not included in groups (a) or (b)...	300.00	200.00	100.00	50.00

Individual Prizes.—For the highest production of butter-fat by a cow during ten consecutive months:

(a) Jerseys or Guernseys	\$200.00	\$100.00	\$50.00	\$25.00
(b) Holsteins	200.00	100.00	50.00	25.00
(c) Grades and other cows not included in groups (a) or (b)....	200.00	100.00	50.00	25.00

(Continued on page 136.)

"THE BULL IS MORE THAN HALF THE HERD."

An experiment station bull sired cows which averaged 153 pounds more butter fat in one year than their mothers did. The highest amount of prizes for any one purpose in the California State Dairy Cow Competition is \$400 in monthly prizes of \$25 each, offered for the highest average production of butter fat by five cows in a grade herd headed by a purebred sire. The same cows may compete only once for this prize.

EDITORIALS

THE WEEK.

WITH the current activity in crop-gathering and selling; with the gloriously moderate temperatures prevailing and contrasting with the fierceness of the extremes east of the mountains; with the political primaries doubling the delights of election day, and with war becoming cooler on this hemisphere as it waxes hotter on the other, the Californian has no excuse for discontent nor dullness. There is, in fact, quite the opposite of these conditions prevailing. Most crops are making a better out-turn and commanding better prices than expected, and though there may be in some lines of trade less activity than operators therein would enjoy, the outlook, when various distractions shall have passed, is certainly very gratifying. Though the year will be counted quiet as compared with the last, which was of course notable through our effort at world entertainment, it will be a year of notable gain in self-confidence and understanding for California—a good preparation for the new conditions which will follow the attainment of peace in the world. During the period of relative leisure after the harvest, there should be quiet thought and discussion of the problems of industry and citizenship which will arise for consideration by the next Legislature, and a little more effort made than usual, perhaps, in the selection of legislators in November, who shall properly represent the fundamental interests and aspirations of the State.

HOW MANY FARMERS FAIL?

SOME of our contemporaries are lambasting each other for things they have printed about the percentage of farmers who go to the bad financially. We have not the exact exclamations to cite, but, as we remember, one journal said nearly all people who go on land go off again, worse for their excursions, and therefore the government should undertake to get them on right and show them how to stay on, or else prevent them from getting on in the first place—and then gave us a column or so of paternalism. Another journal denies the allegation that nearly all farmers fail; that, if they did, they would have no credit for anything instead of the good credit standing which they now enjoy—and then gave us a column or so of anti-paternalism. Now, as to the issues between these two dromios of the near-farming press, one needs but a little common sense to reach a workable distinguishment. Manifestly, the first declaration, which exploits the universal failure of farmers, is based upon the all too sad experiences of assisted farmers whom over-zealous subdividers have planted on poor land, with neither farming knowledge nor sufficient capital to work with, by convincing them that knowledge was not necessary and by taking away from them all the money they had, in partial payment for the land. The fundamental fact is that not one man in a thousand can farm successfully without knowledge or money. Incidental facts are that the land was often poor, over-valued, and unready for cropping. These incidental facts, even though grievous, might be overcome if the men

knew how to work and had money to work with—but the fundamentals are indispensable. Naturally, statistics drawn from the experience of men who have been staked out on land without these fundamentals, will show a very great preponderance of failures and nearly everything which can be reasonably said about the humane duty of the State to guard her unwary wards against imposition of this kind is warranted. They may have to be protected against imposition by interested fleecers in some cases; we are sure they should be protected against their own delight in being imposed upon, and the general public should be punished in some way for prescribing farming as a pursuit for restless people with empty heads and pockets. Of course figures of farming failures based upon the experience of such people should not be made to apply to farmers as a class nor to farming as an occupation. When that is done, it is perfectly just to say that the true standing of farmers among the industrial classes of the country is wrongly impeached. It was true a few years ago, and we believe there have not been enough escapades of over-the-wall intruders to change the fact that the percentage of failures among American farmers was lower than in any other occupation of men. It was of the farmer that the villager said: "His word is as good as his bond." It was the farmer's endorsement on the villager's note which made the country banker mellow. It was for visiting farmers' notes that sharks jostled each other in the dark city waters. It is, of course, a great mistake to claim that our real farmers, who have used their land wisely and generously, and who have labored intelligently in ways which they understand, have been otherwise than successful in greater percentage than have men in other occupations. They are not asking for special privilege. Their claim is for fair play; they ask protection only from those who entrench themselves between the farm and the market and take, say, three-fifths of the consumer's dollar instead of one-fifth of it. Although they have carried this handicap for generations, farmers have always been the most dependable and financially the soundest class of our industrial population. They have succeeded because they have had the largest endowment of practical wisdom and of persistent, self-denying work.

THE PROPER ATTITUDE.

THE persistent enemy of good, dependable, successful farming is the gambler, and "gambler" is the name of a genus, with many species. It is a genus of parasitic fungi with very grotesque forms, such as the "hoss-trader," the shell-artist, the gold-brick conspirator, and the like. These fungi have also more elaborately organized forms: the promoters of wild-cat ventures, the vendors of expensive uselessness for the farm and the farm home; the gamblers who make farm products a foot-ball for kicking by those who buy and sell nothing but scraps of paper. More recently farming has been widely exploited as an arena for action by new experts in social economy, some of whom are sincerely philanthropic, others politically altruistic. And yet, the basic conservatism, financial dependability and secure success of farmers as a class, remain firm and will not be seriously shaken. And this basic character will always remain because its collapse would wreck the world. No matter how far ambitious agitators may push the pendulum of honest and successful farming policy, one way or the other, the accumulating backward force of its return to its center of gravity in established economic order, will mow them down. Therefore, in this time of many half-truths and doubtful deductions, it is perfectly safe for the farmer to give diligent heed to their proponents and to join in a general effort to demonstrate whatever truth there may be in them. It is the only way by which farming can be advanced to full understanding of its relations and forced to occupy its place in the sunlight of fair play among the activities of mankind. It is not true that "he who hesitates is lost," as these new agitators for economic progress exhort us, but it is true that he who shirks his share of the advancement efforts which are now being made will to that extent retard the attainment of things eminently to be desired. Get into the middle

of the fight and strike hard for what is right as you see the right!

GRAIN-GAMBLING IN THE NORTHWEST.

THERE have been many efforts in the Middle West during the last few decades to stop "grain-gambling," which is generally understood not to mean speculation in grain buying and selling, but speculation in paper tokens for grain, which ends in paying margins one way or the other and which has no more relation to real property than the writing or printing of the name thereof on the paper token. These efforts to stop this fictitious trading have accomplished so little that a stronger movement has now arisen. It is announced that North Dakota farmers have launched a nation-wide fight to stop gambling on grain and farm products in all stock markets of the United States. The movement is by the Non-Partisan Political League of North Dakota, which has just swept the State of North Dakota clean, in the recent primaries—nominating all their State candidates. The effort was begun by farmers, and was supported by labor union men of North Dakota's cities. The organization was for the single object of the complete abolition of all gambling with grains and foods. The leaders are enrolling farmers of Minnesota, and when that State is swung, it is planned to make the movement national. It is eminently fitting that these great grain States should attack this fictitious trade and they seem to be doing it in a way to win. Its evil effects are more real to them than to us, for grain is relatively small with us at present, and yet the prohibition of such trading may have far-reaching effect. We have forms of food gambling which are exceedingly grievous in their effects and which arbitrarily and unreasonably influence the value of a food before it actually comes into existence at all. It is purely fictitious because it aims to deal with the value of a thing which may never exist or may exist beyond all reasonable expectation. Therefore, it is a scheme of a go-between to rob either the producer or the consumer, or to wreck himself, as the case may be. It is not legitimate trade and everyone should be protected against it.

THE PRODUCER AND HIS DEFENSE.

WE DO not underrate the importance of early selling. It is advisable that a product should move quickly, and that some one should be ready to push it into consumption. Advance selling as soon as a reasonable conclusion can be reached of the probable amount of a crop is a good thing in its general results if one enters upon it wisely and with a good motive. Indeed, if the motive is fair trade, he may legitimately take his chance on buying or selling on what he considers his prophetic power, resulting from his study or experience in available supplies and demands. But there ought to be some check placed upon a man's willingness to gamble for the clear purpose of depressing values of others' property through some break which his bluff may produce. Such operations are in restraint and demoralization of legitimate trade. They are surely immoral even if they should never be made illegal. We have recently seen such things undertaken with almonds and prunes, the influence of which, so far as they have any, will be to rob some one of what fairly belongs to him as the fair recompense for his investment and his labor. Perhaps this infringement of another man's rights cannot be reached by law, but it is not therefore incapable of prevention. It seems to us the available force against such dynamiting of legitimate trade lies in producers' co-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., August 1, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka02	1.31	.11	62	48
Red Bluff	0	1.02	0	98	62
Sacramento	0	.06	0	94	54
San Francisco	0	.03	.01	70	50
San Jose	0	0	0	90	44
Fresno	0	0	0	100	58
Independence	0	0	0	98	—
San Luis Obispo	0	0	.01	80	44
Los Angeles	0	0	0	84	58
San Diego	0	.02	0	74	60

operation. If producers can, by association, keep these flighty dealers from getting goods below a reasonable and warranted price, their gambling on the chances of getting supplies below value from handicapped, weak, or timid growers will be reduced to amounts which will be negligible. This is what the organizations with control and capital are now doing or aiming to do.

PROCLAMATION WITHOUT POWER.

SUCH proclamations may, possibly, do more harm than good; they are apt to do nothing but supply the enemy with targets to fire at. If we are not mistaken, the recent convention to declare a minimum prune price for 1916 has operated about in that way. The meeting declared resolutely for 6 cents, but we emerged from the sound of the discussion with the impression that, unless one really wanted prunes, it could be dangerous to offer some fraction below 6c. to those resolute people, in corners of the fence where you might encounter them singly. It seems to have turned out that way, if the gossip we hear is at all true. The price was a bluff because there was no power behind it. It was a public bluff, and therefore more impotent than a quiet, determined attitude, assumed by many people privately, which one may keep coming up against and find his attack constantly weakening. Now they say that buyers have stopped bidding, and some people are getting alarmed because buyers did not follow them home and offer 6c. Buyers are not that kind of fools, nor are the Eastern dealers upon whom they plan to unload. A bluff suggests a bluff and that is what the growers have been getting since the meeting, unless we are very much mistaken. The growers' committee is not a control organization; it is an advisory affair. As it has no power nor control, it would have been better not to start machinery which needs power to be effective. The public meeting seemed a good way to get broad, advisory data, and yet we are quite sure the committee did not learn a new thing about growers' desires by the assembly. They could have gone on quietly securing facts and have quietly suggested that 6c. was the point aimed at by many growers. That is all the convention did, but it did that most offensively. It invited just the attitude which buyers afterward assumed. A confidential, advisory mention of 6c. by the committee would have made every prune grower just as wise, and it might not have arrested the bidding which, we understand, was quite brisk just before the convention.

There seem to us two lessons to be drawn from this recent experience:

First, it is idle to think of driving an enemy from his entrenchments by simply filling the sky with "light bombs" if you have no high explosives to drop on him. It simply shows him where you are so he can yell at you to go to a hotter place.

Second, this little game of bluff and bluff does not have the slightest effect on the real value of prunes. It is still long enough before the crop is in to do all the early business that still remains to be done. If the growers can stand the buyers' bluff as well as the buyers' stood the growers' bluff of June 23, there will be no danger of the sky falling. But, of course, to right wrongs and to insure fair trading, there must be organizations with all kinds of power to support their proclamations.

Unirrigated Alfalfa.

To the Editor: I am anxious to grow, if possible, alfalfa on a thirty-acre field where irrigation in summer is impractical.

The field grows wheat, sown in March, from forty-two to seventy-five inches tall and never fails. The land is deep rich loam with some gravel mixed all through it. The field slopes at the rate of about two per cent and is uniform in slope right down to winter flood water—the highest part of the field being about eighteen feet above high water mark. Water never stands on any part of the land. Annual rainfall is about forty inches beginning in September and ceases about June 15th. Frosts sufficient to kill tomato plants do not usually occur before November 25th. Elevation about 1000 ft. Would you advise fall sowing

and how about Turkestan, Grimm or common alfalfa?—H. M. C., Covelo.

You ought to get plenty of alfalfa without irrigation under the conditions described and we should sow the common variety. If you can plow the land dry, leave the furrows up and harrow down and sow as soon as you get fall rain enough to wet down well. With the frostless fall you speak of, you ought to get growth enough to go into dormancy well and then, while dormant, it does not matter how much water you get on it. But if you sometimes get sharp frosts much earlier it is better to fear them than to trust to their not coming. With rains as late as June you are fairly sure to get a good stand from March sowing, if you can then count on frost-freedom. Alfalfa will not stand frost like wheat, and with rains coming so late you can wait for later sowing than you name for wheat. Either fall or spring sowing ought to work well with you—if you have luck enough to have things come as you expect.

Irrigating Fruit Trees.

To the Editor: Should fruit trees be watered by the square check system, allowing a square for 4 trees, or should they be watered by the little streams of water running through the rows between the trees, making about five or six furrows to hold the small flow? We can only get water about twice during the watering season for trees, so this will make quite a difference in the system used.—H., Modesto.

The system of irrigation which is best for any piece of ground depends upon the slope and character of the soil. Where the furrows can be drawn in such a way that small streams of water can move slowly through them and the soil is of such character that the water will move sideways through it, as well as downward, the furrow-system is best, because the soil can be evenly moistened below without wetting and puddling the surface. If, however, the soil is so light (open or sandy) that the water goes downward too fast and too far, without moving sideways sufficiently, it is necessary to use checks or basins and use a large head of water to fill them quickly so that the downward movement of the water may reach all the soil mass included in the check. In all cases thorough cultivation must follow.

If you have to use a large head of water for a short run you may be obliged to use checks. A smaller head and longer run favors furrows, if the soil is right for it. This is a large subject. It is discussed in details, with methods and reasons, in "California Fruits and How to Grow Them."

Dandelions in Lawns.

To the Editor: Can you suggest something to rid my lawn of dandelion? I have had it cut off several times and it seems to come up as thick as ever. I hate to dig the entire lawn up, it's so hard to start again.—L. G., Merced.

We have to confess that dandelions are not easy. We have just dug over, for re-seeding this fall, an old lawn which seemed to have as much dandelion as grass. We have also two other pieces which are under the cutting-out treatment and they have at present a hopeful look which has cost us much work. Where the neighbors fill the wind with taubes carrying seed-bombs the outlook for a dandelion war must be doubtful.

Cutting-out is waste of time, unless you cut deeply so as to bring out several inches of the fleshy tap root. This is done with a chisel or an old table knife, squared and sharpened at the end so you can plunge it in obliquely and cut the root several inches below the surface. It is then only a question of keeping at it, for a plant cut and pulled out that way cannot start again.

There comes a claimed demonstration from Colorado and Minnesota that dandelions can be killed and cleaned out by spraying once a month during one summer, with sulphate of iron, 1½ lbs. to a gallon of water. This must be shot forcibly into the lawn with a forceful spray pump—not merely sprinkled on. This cannot be used on a clover lawn, for it will kill clover or any other broad-leaved plant, but the grass will survive such treatment. The lawn should not be watered for

three days after the copperas water is applied. We have never mustered spunk enough to try this ourselves—still it is possibly the true way for amateurs with a high efficiency-percentage.

Blooming Celery Plants.

To the Editor: I am growing celery in a trench fully a foot deep and it looks bonanza and promises a performance to beat anything purchasable—but a number of the plants are coming into bloom. Do you suppose the seedlings which were given me were sown too early? I do not think they have suffered from dryness since planted.—C., Napa.

It is possible that the seed was sown too early and the plants went through a dormant period—their growth being arrested by cold or drouth. It is also possible that the seed was too old or was taken from poor plants. Such seed is apt to produce plants lacking vigor, which are liable to disease, to bloom-breaking, etc. The only way to get good celery is to use fresh, selected seed and keep the plant going strongly, and then transplanting does not upset its first impulse toward strong leafage. Probably poor seed has caused commercial growers more loss and vexation than any other single difficulty they have encountered.

Rose Leaf Cutting.

To the Editor: Something is simply riddling my rose bushes, but I can find no trace of the pest. The inclosed leaf is taken from a climbing rose and was picked about eight feet from the ground. Is it possible that a worm, living in the ground in the day time, travels even much higher than that every night to eat the foliage? If you can tell me what to do for it, I shall certainly appreciate it.—H. A., Tulare.

The clean-cut circular or half circular pieces taken from your rose leaves have been carved out by leaf-cutting bees (megachile). They are of the bustling form of bumble bees but smaller. They do not eat the leaf-pieces but make cells of them, for their larvae to grow in, by placing them in layers and gumming them together, in hollow plant-stems or in cracks in the carpentry of your house. They are probably very thankful to you for growing such nice rose leaves so near to the place where they wish to use them. They cannot be called pests. It is better to use Josh Billing's classification and call them "interestin' little cusses." Just watch for them and see how quickly they can snip out a piece of leaf and fly away with it.

Strawberry Crown Borer.

To the Editor: We have a bed of strawberries with a sub-irrigation system. The plants were healthy, but before long, plant after plant seemed to die. We dug up one plant and a borer was in the root. Two-thirds of the plants died just that way, but a dozen or more plants at the end nearest the faucet lived, and seem very strong and healthy. What can we do to get rid of that borer, or worm in strawberry roots?—E. G., Vallejo.

The insect called the crown or root borer is destroying your strawberry plants. It is quite a common pest and does much injury and it is not easy to fight. Removing and burning plants as soon as you notice their failing symptoms will reduce the multiplying of the insect. This can best be done in February—a little before the perfect insect appears to lay eggs for more worms in April. By this time of the year the eggs are probably all laid and new grubs are beginning to work. If you can border the bed and keep water standing on the plants for four or five days, it will kill the worms. This can be done any time during the fall or early winter, for the grubs are growing for months in the root-crowns. Where such submersion is not possible, about all you can do is to take out and burn all plants which are going wrong.

Stump Blasting.

In answering a question about removing stumps with powder we inadvertently neglected to mention the Hercules Powder Co., Chronicle Building, San Francisco, as publishers of a desirable pamphlet describing how this work can be done. The Hercules people have been long at the effort to make explosives useful in farming, and should not be overlooked.

Citrus Blast---a New Disease.

[Written for Pacific Rural Press by R. W. Hodgson, Berkeley.]

On returning to Oroville in May, 1915, the writer was struck by the wide-spread occurrence of a condition ascribed to a late frost by some growers, and characterized by others, where no frost could have occurred, as a "heavy leaf drop." This condition was found due to neither of these causes, but was apparently the result of the same disease which had been first noticed three years before. The same peculiar canker was prevalent all through the mature trees. Throughout the remainder of the season this trouble was studied.

Causal Organism.—Under the personal supervision of Prof. R. E. Smith, investigations carried on recently have demonstrated the causal organism to be a bacterium, probably of the genus *Pseudomonas*. The disease is technically defined as a bacterial wilt of citrus.

Disease Characteristics.—Infection is apparently confined to new spring growth, and occurs chiefly at the junction of the petiole and blade of the leaf. It also occurs at the tips of the very young leaves and tender shoots. Once established, the disease progresses rapidly down the shoot toward the older wood. Only the new tender growth is affected, the older limbs apparently possessing greater resistance. The young shoots are often killed back to the older wood including a portion of the bark about the base of the infected shoot. At these points the characteristic cankers are formed. It is not unusual to find a branch several feet long with every node infected.

Leaves Hang On.—Upon infection the leaf turns pale yellow, then darkens irregularly in spots and wilts in place, where it later shrivels and dries, still hanging to the shoot. If the disease is virulent and conditions favorable, it may attack small branches of the previous season's growth, killing them back several feet.

The dead area about the base of the infected leaf or shoot varies greatly in size, and is ordinarily more or less irregular in shape, frequently extending along the stem some distance. On younger growth, girdling is apt to occur and the

shoot dies back to the point.

The disease spreads with remarkable rapidity. Only a few days of the proper weather conditions are required for serious damage.

As the dry season approaches, activity is retarded and in mid-summer the disease is entirely quiescent. The wilted shoots and leaves shrivel and dry. At this season they may be found as veritable herbaria of various fungi among which are the common withertip and gray mold. The line of separation between healthy and infected tissue becomes very clear-cut and definite. Frequently in early summer, a pinkish, resinous gum is exuded from the cankers. These, as well as all the dying or dead tissues, take on a characteristic dark red color, and are sunk below the surface of the healthy tissue. This dead wood, as it dries, becomes very hard and tough. The healing process begins and, in the wounds, callous material is developed which raises the dead tissue up in the form of scabs. These are sluffed off in the course of time leaving very characteristic scars which may be visible for several years.

A Peculiarity.—The infection does not seem to penetrate into the wood. Indeed, in some cases, the cambium layer is not killed, which is evidenced by the formation of callous material in the center of the wound as well as about the edges. Where trees containing a large amount of weak, twiggy, interior brush are badly attacked the bark rots away leaving the interior of the tree full of dead white twigs which may resist decay for several years.

Later in the season the effects of the disease are masked by the new growth. To find it at this time one must examine those branches under three-quarters of an inch in diameter for the cankers.

Pear Blight Methods.—One of the large holdings in the Northern Citrus district is now using pear blight control methods in an attempt to eradicate the disease. We may expect, as is the base in all bacterial diseases, to find efficient control difficult, but it is hoped that observations and experiments made this season may lead to some cheap commercial method.

What Eastern Fruit Buyers Said.

"Properly packed, there is practically an unlimited market for early California fruits in the East."

[Written for Pacific Rural Press by Prof. W. L. Howard, University of Cal.]

Last winter, while in the East, I made a special effort to investigate conditions surrounding the sale of California fruits, particularly green apricots, peaches, and plums. I visited most of the prominent dealers in Chicago. The opinions of the president of the auction there and also the auctioneer himself were typical of what I heard. These gentlemen told me it was a shame the kind of packing many of the California growers were doing. Properly packed, they declared that there was practically an unlimited market for early California fruits. Many of the retailers in Chicago, they declared, were handling much less early fruit than formerly, because many of their

best customers had quit buying. The reasons were always the same—that only the top layer of any basket of the very early fruit was fit to eat.

Many of the customers of that early fruit are perfectly willing to pay any reasonable price, and even an unreasonable price, for fruit provided they get something for their money. Some of the dealers told me that they had traced shipments direct to the consumers and found that they had become discouraged and had quit buying.

The president of the auction and other prominent commission men declared that they would be glad to co-operate with the state authorities in California for the improve-

ment of our fruit pack. J. Ellis Slater assured me that if we had a central authority here who would take the matter in hand, he would be glad, at his own expense, to send to that authority packages of fruit that he was sure he would receive this spring, provided that state officials would follow up the case by taking the matter up with the grower who packed the fruit and try to remedy the situation.

"California" Magic.—I asked several commission men why it was they had been able to sell California fruit so long, if it was packed so badly as they claimed. The answer was always the same—that in the past they had been able to sell practically any-

thing that was labeled "California" or "California grown." This impressed me very much, and I discussed the matter with the auctioneer. He assured me that too many Californians had very little appreciation of the value or prestige of the name California on a fruit package. He gave it as his opinion that thousands of people in the East, in the past, have bought California fruits that were not fit to eat, but while under the hypnotic spell of the name on the package, would take a bite of a half-grown apricot or peach, close their eyes, conjure up visions of orange groves and gold mines, and persuade themselves that it was good. However, when the fruits were placed

on the table and the package with the magical name was out of sight, the spell would invariably be broken and neither the owner of the household nor his guests were able to get any pleasure out of the fruit, and hence they had quit buying it. When asked if we could redeem ourselves by sending a better grade of fruit, he unhesitatingly said that we could.

MERCED FIG DRYING.

[Written for Pacific Rural Press.]

Adriatic figs should be picked from the ground as soon as possible after they fall and not later than three days at the most, according to D. R. Oliver of Merced county, who farms the 13-acre Rodger orchard, one of the oldest and best fig orchards in the county.

Lug boxes are used to pick in and directly after gathering 75 full boxes are put into the sulphur house, where they are allowed to stand over night, or if badly rushed, six hours. For that number of boxes two quarts of sulphur is used, equivalent to four or five pounds.

When taken from the sulphur house the figs are put on trays which are set in the sun for one to one and a half days in warm weather. After that they are sorted and dumped in the bins, care being taken to keep the pile in the bin level so that they all go through the sweat in the same degree. By keeping them stored in

these bins some time before shipping they have more weight and sugar up better.

Calimyrna figs receive much different treatment by Mr. Oliver, than the Adriatics, no sulphuring being done in this case. Instead the figs are put directly onto trays after dropping and these trays are stacked in order to protect the fruit from the hot summer sun, which would otherwise dry them out too quickly. Late in the season it is sometimes deemed advisable to let them lay in the sun instead of in stacks.

The time that they are left in the trays depends upon the weather, four days being sufficiently long in the hottest and a week being required in cooler weather.

As soon as they are dried on the trays they are taken to the bins and also allowed to go through a sweat, this method making a more pliable skin and less toughness according to Mr. Oliver. Late in the fall it is more difficult to dry Calimyrnas on account of their getting sour on the trays if the weather is cool or damp.

Dipping and sulphuring Calimyrnas is a waste of time, thinks Mr. Oliver; in fact, he finds that buyers prefer to have them just as near to the way they come from the tree as possible and Mr. Oliver's way meets that requirement.

The fig season on this ranch starts about August 10 and continues till the middle of October, about 50 tons of dried fruit being harvested per year from the 13 acres of Adriatics.

DRYING PEACHES.

The California Peach Growers' Association wishes to raise the standard of the California dried peach. It therefore requests that each grower make an especial effort to produce clean, bright fruit.

The final settlement between the Association and the growers will be on the basis of grades. The better the fruit, the higher price the grower will get for his peaches. As some of our growers are inexperienced in the proper methods of drying peaches, we make the following suggestions:

Do not shake the fruit from the trees. Pick carefully and at the proper time. Fruit picked too green will have neither weight nor flavor; if too ripe, the result will be a lot of slabs.

Peaches must be properly sulphured. This condition is attained only when the cup in the up-turned half of the peach is filled with syrup. No definite rule as to the amount of sulphur required can be given. This depends on the tightness of the sulphur house and the condition of the fruit. Use only the best quality of sulphur.

Do not spread the fruit on the dry-ground after four o'clock in the afternoon, but rather leave it in the sulphur house over night. The dampness of the night will darken the fruit.

Do not use an alfalfa field for the dry-ground. Green foliage such as grass or weeds under the drying trays will darken the fruit. Use a clean dry-ground.

When the fruit begins to shrivel, the trays should be stacked and the fruit allowed to become thoroughly dry in the stack instead of on the ground.

John Deere Implements

John Deere Plows for Light Tractors

With High and Level
• Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.

Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.
2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.
3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

A Farm Book For The Asking

A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152.

State Crops and Market Notes.

[Written for Pacific Rural Press.]

The following table shows as accurately as possible the condition of the total State crops. Figures are based on estimates of horticultural commissioners reported to Deputy State Horticultural Commissioner Geo. P. Weldon.

It is evident that a 90 per cent condition of peaches in a county which produces 5 per cent of the total State crop does not mean so much as a 90 per cent condition to a county which produces 29 per cent.

To arrive at the true State averages, take pears for example.

A Sacramento county normal crop is .18 of State normal tonnage. Sacramento county reports .68 of normal crop. .68 multiplied .18 equals .1223 of State normal tonnage. If that is 10,000 tons, then Sacramento county produces 1124 tons this year. Adding similar figures for all counties producing over 2 per cent of the normal State tonnage, we have .5028 of normal State tonnage as the prospective tonnage this year from counties producing 80 per cent or .80 of the State tonnage. Dividing .5028 by .80 we find that the average condition of all the acres of pears in all of the counties which produce a total of 80 per cent of the State normal crop, is 62.85 per cent of normal. It is reasonably accurate to assume that the crop in the other 20 per cent will average the same.

STATE AVERAGE CROP CONDITIONS.

State average is assumed to be practically the same as the total true average for all the counties producing normally over 2% of the State normal crop.

FRUIT	% of total normal State tonnage produced this year in these counties...	% of total normal State tonnage produced by counties which produce over 2% of it.....	Total average condition of crops in these counties: % of normal.....
Almonds	76	45.40	59.7
Apples	90	75.75	84.2
Figs	89	86.40	97.0
Lemons	97	87.30	90.0
Olives	95	67.95	71.5
Oranges	96	79.40	82.7
Peaches	85	59.00	69.4
Pears	80	50.28	62.85
Plums	56	40.45	72.2
Prunes	82	44.40	54.1
Walnuts	98	81.80	83.5

Note: Solano county excluded because there is no report.

Grapes.—The first shipments of Malagas and Thompson Seedless were made late in July, Horticultural Commissioner Roullard having nine inspectors in the field and three more to add as soon as shipments get heavier. All of these inspectors have either motorcycles or automobiles and spend all of their time at the various packing houses in their respective districts. They do not stay at any one packing house long, neither do they state when they will be at certain places. Some rejections have been made on account of green fruit.

Mildew has already started to appear in the county, though only to a limited extent. Notwithstanding the fact that the season is about two weeks early this year, the sugar content is exceedingly good. Shipments of Thompsons will be materially reduced on account of the high price of raisins of that variety.

According to W. P. Giffen, where

grapes are only moderately affected with mildew they have no serious effects on the raisin market. Where it is bad, the grapes are not made into raisins at all, so taken as a whole mildew does not affect the raisin market.

The raisin people are all feeling good. The crop will be some lighter than it was last year. No holdover is anticipated. No exporting has been done for several months; but it is thought that some may soon be shipped. He attributes present good markets to advertising, general employment at good wages all over the country, and the lack of importation of currants and raisins from other countries on account of war. He thinks there is no question but that Thompsons will be heavily planted the coming season as they have been in the past two years on account of the price of seedless raisins. Whether they are the most desirable is purely a question for everyone to decide for himself.

State horticultural commission reports indicate full crops in Fresno, Tulare, Kings, Kern, Los Angeles, San Diego, San Bernardino, Marin, Merced, and Yuba counties. Sutter raisin varieties 90, table 100; Yolo 80 and 80; San Joaquin table 50; Sacramento table and raisin 25; Riverside table 90; Madera raisin 100, table 80; Colusa table and raisin 75, and Butte 70. Stanislaus reports 125 per cent of all varieties.

Peaches.—Fresno county Horticultural Commissioner F. P. Roullard says that little-leaf has affected peach crop 20 to 30 per cent this year. He figures that the crop in this county will be 55 to 60 per cent of normal. A good many peaches have been shipped from this county as fresh fruit this year, these shipments just being completed the last of July. Muirs are the only variety that are a full crop this year in Fresno county.

The average crop of dried peaches for the past five years has been 26,000 tons. The average for the last three years has been 30,000 tons and it is estimated by Manager Niswander of the Cal. Peach Growers' Ass'n that this year's crop will be about 25,000 tons. There are 41,000 acres signed up in the Association, but nobody knows what the total acreage of the State is. It is estimated around 50,000 acres.

Peeled Peaches.—There have not been over three or four carloads of peeled dried peaches sold in any one year before, because of the excessive cost of peeling, making them sell at 12 to 15 cents a pound. If some mechanical method of peeling them can be devised, and the Peach Growers' Association is working toward that end now, 75 per cent of the crop could be sold in that manner, at not to exceed 10 cents a pound.

Prunes.—While the prune crop in our crop report table looks small, our own observations and reports would indicate that the crop will not be so light as anticipated. Props and trays have been sold this season and are being freely used in Santa Clara Valley. Individual estimates from over two hundred prune growers, made to sales manager W. S. Breton of the Cal. Farmers' Union, average

well over 80 per cent of last year's crop. These estimates have been rising with each report. Very little aphid or cracking has occurred, and not a lot of dropping. Contra Costa was severely damaged by cracking but that county produces less than 2 per cent of the State crop.

Present Prices Do Not Indicate Value. — Notwithstanding the increasing crop estimates, there seems no reason to change earlier marketing decisions. About three-quarters of California prunes are still in the growers' hands. There seem scarcely enough prunes in the world to supply a normal demand, and growers will observe that the downward tendency of prices occurs often at this season without indicating what the price will be when harvest

is over. "No Eastern dealers will buy on a falling market, but farmers help a falling market down by becoming panic stricken." Packers received a lesson last season on selling short, and they are said to have few orders to date because they are afraid to sell fruit that they don't own, low enough to tempt Eastern jobbers to speculate. Western packers can't sell short unless Eastern jobbers think the price will rise enough for them to make some money. Growers succeeded in raising the 3 1/2-cent offers last year to 5 cents, and the crop was cleaned up. With a smaller crop this year, draw your own conclusions. If you organize rightly, you will control all speculation next year and secure right prices.

Rural Credit Loan Board Appointed.

The next step toward installation of rural credit under government auspices has been taken.

WASHINGTON, July 27. — President Wilson today nominated Charles E. Lobdell of Great Bend, Kas.; George W. Norris of Philadelphia; W. S. A. Smith of Sioux City, Ia., and Herbert Quick of Berkeley Springs, W. Va., as members of the Farm Loan Board, created under the rural credits bill recently passed by Congress. Secretary McAdoo is an ex-officio member of the board.

The President hopes to have the nominations confirmed quickly by the Senate in order that the organization of the rural credits system be perfected without delay.

Lobdell (Republican) is a student of farmers' problems and has had extensive experience in loans on farm lands. He was a farmer before studying law, served in the Kansas Legislature for ten years and was Speaker of the Kansas House in 1895. In 1902 he was elected a Judge and served on the bench for nine years, resigning to become president of a bank at Great Bend.

Norris (Democrat) is a graduate of the University of Pennsylvania and has been successively a newspaper man, a lawyer and a banker. In 1911 he retired from the banking business to study social and economic questions. Later he became a director and deputy chairman of the Federal Reserve Bank of Philadelphia.

Smith (Republican) is a farmer by occupation, for the last year has been an expert in farm practice in the Department of Agriculture, and has had extensive experience in farming problems.

Quick (Democrat), until a few months ago, was editor of Farm and Fireside, and for many years has devoted himself to a study of rural credits and other farm problems. Early in his career he taught school and practiced law, and later was general manager of a telephone company in Nebraska and Iowa.

GRASS FOR WET LAND.

To the Editor: I have about 10 acres that has been sub-irrigating more each year until now a little is under water, and some of it only a foot down to the water table. As one drives over it, if very wet, a team can scarcely get through, but after it has been travelled or pastured some time, it does not get soft even if under water for months. Beans planted this year are getting yellow. What kind of grass can I

sow for good pasture; when should it be sowed; how much per acre, and will it have to be resowed every year? Perhaps I will put sheep on it.—E. L., Winton.

[Answered by Prof. P. B. Kennedy, University of California.]

[The grasses most likely to succeed under the conditions of soil and moisture that you describe are the Italian and perennial rye grasses, and red top, all of which can be purchased on the market.

The best time to sow would be in the fall of the year if the winters are mild, with rain and no snow; if there are cold winters, with intermittent snows and freezes, and cold and rain, then it would be almost necessary to sow them in the spring as early as the preparation of the land will permit, and after the worst freezes are over.

Rye grasses are sown at the rate of about 35 pounds per acre, usually broadcast. Red top varieties from 10 to 20 pounds per acre, according to the quality of the seed purchased. No. 1 grade, which contains practically pure seed and no chaff, required 10 pounds; No. 2 grade, 15 pounds; No. 3 grade about 20 pounds per acre. This last mentioned must be very lightly covered.

Probably about 10 pounds Italian rye grass, 10 pounds perennial rye grass, and 15 pounds red top would meet your requirements and give you a satisfactory pasture.]

[If you pasture sheep on wet land look out for foot rot. It is considered poor practice among sheepmen.—Ed.]

ARSENICALS AND DIABROTICAS.

To the Editor: What quantity of arsenate of lead, "Corona Dry," should be used when the directions call for one tablespoonful to paris green? Is there any way to rid dahlias and Shasta daisies of the little "green lady-bug," greenish yellow, black spotted wings, that devour the flowers almost as soon as they develop? Could Corona Dry or paris green be used in a weak mixture that would not be dangerous to children, and yet do away with the "lady-bug"?—F. J. H., Los Angeles.

Geo. P. Gray, who has charge of the insecticide and fungicide laboratory of the University says: "Corona Dry Arsenate of Lead contains about 30 per cent of arsenic in the form of arsenic pentoxide. Paris green

contains a little over 55 per cent of arsenic in the form of arsenic trioxide. Roughly speaking, when the formula calls for a tablespoonful of paris green, use two tablespoonfuls of Corona Dry Arsenate of Lead."

Concerning diabroticas, which are the insects you describe, E. O. Essig, of the entomological department of the University, says: "The best method for controlling the diabrotica is the application of a neutral lead arsenate 3 lbs to 50 gallons of water. This seems to act as a repellent, and experiments made by myself are proving very satisfactory."

We cannot give you any advice about using a virulent poison in a flower garden frequented by children. You must take the responsibility yourself. With our own children and their quality of obedience (with which their mother is to be credited) we should consider it safe.—Ed.]

The Southern California Tractors Association held their meeting in Los Angeles on July 18, and decided on holding a tractor demonstration in Los Angeles county the latter part of September. The location and date of this demonstration will be decided at a meeting held in the near future, at which time a definite date will be announced.

California Highways---Present and Future.

The State Highway Commission's "overhead" expense has been 4.41 per cent, 1820 miles of highway have been completed, including some of the most difficult projects, many sections are uncompleted for lack of funds.

[Written for Pacific Rural Press.]

At a time when Congress has just appropriated \$85,000,000 for national highways and the California State Highway Commission has spent \$18,000,000 and wants \$15,000,000 more, it is well to note what has been done and what is proposed.

The National Highway Ass'n of Washington, D. C., proposes 100,000 miles of roads to be built by the Federal Government, traversing 2030 of the 2953 counties in U. S. This will relieve the States, counties, and smaller units of the cost of these roads so their regular appropriations may be put into more permanent local work where many of them are now spending all of their appropriations in maintenance of poor roads at excessive cost.

mately \$79,000,000 was spent by all the States, counties, districts, and townships in U. S. for road purposes. Ten years later the corresponding expenditures were nearly \$225,000,000. In the present year it is estimated that \$300,000,000 will be spent on roads. Last year there were 2,445,664 registered motor cars of all sorts in U. S.—more than one per mile of rural roads.

Government Appropriation.—Of the \$85,000,000 recently appropriated by the Government \$10,000,000 goes into National Forest roads. \$5,000,000 of the remainder is available for distribution to the States this year. After June 30, 1917, the appropriation is increased at the rate of \$5,000,000 a year until 1921

A Moreland Truck Operating on a Southern California Highway.

The American Highway Ass'n furnishes the following figures: There are approximately, not counting streets in incorporated cities and towns, 2,275,000 miles of public roads in U. S. In 1904, approxi-

when \$25,000,000 will be available. This money is to be distributed to the States according to their proportion of area, population, and mileage of rural mail delivery routes. California's share this year is figured at \$151,063.92. It must be used to pay half the expense of permanent roads built and to be maintained by the States.

California's Achievements.—Under the State Highways Act of 1909, the State Highway Commission had built, up to Apr. 15, 1916, 933 miles of concrete highway (including 3 miles of concrete trestle over Yolo Basin at a cost of \$400,000), 129 miles of oiled macadam, 33 miles asphalt, had graded 395 miles more and had surveyed 2280 miles of road. Towns and cities have built their own sections. Bridges with 21-foot roadways, mostly of concrete and capable of carrying a 20-ton tractor, have been built by counties under the Commission's plans and supervision. This has included the moving of 11,750,000 yards of earth and rock @ 38 cents average, and the laying of 8,750,000 square yards of concrete pavement @ 74½ cents.

Permanence and low cost of maintenance have been considered more important than first cost. Ex-Governor Gillett said he expected the system of state highway trunk lines

KEROSENE ENGINES

WITTE 1916 MODEL

**90 DAYS TRIAL
EASY TERMS**

FREE BOOK — Greatest Engine value I ever offered.—Ed. H. Witte.

Pulls 30 to 50 per cent over factory rating. Sturdy; dependable; Lowest priced; Lowest cost of operation; Better built. My 30 years' engine experience and a \$500,000 factory behind every engine I sell.

Inside Facts about the engine business are told in my Free 4-color book. Don't buy an engine at any price till you read it. Full of interesting information.

**Better Make
Not Made**

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Ames-Irvin Solderless Lock Seam

Nothing But the Sheet of Metal Itself is Used to Make

AMES-IRVIN Irrigation Pipe

Neither solder or rivets are used in its construction. Each sheet is edged, locked together and then set down under 3500 pounds pressure. Such a seam will not break or leak. It is simple, solid and strong, with no holes in the steel.

Ames-Irvin Lock-Seamed irrigation pipe was the first prize-winner against all competitors at the Sacramento State Fair in 1913 and the Fresno and San Jose County Fairs in 1912.

required by the State would cost over \$50,000,000; that the \$18,000,000 voted was simply to prove to the people their advantages.

Overhead Expenses.—Under the law, all books and papers pertaining to the work of the Commission are at all times open to the inspection of "any citizen of the State."

A recently issued circular of the Commission states that "out of every dollar of the \$16,119,583 expended to Apr. 15, 1916, 87½ cents went directly into the roads in materials bought at rock-bottom prices and contracts let under keen competition. The remaining 12½ cents represents every other character of expenditure including costly preliminary surveys of mountain laterals," an engineer inspector on every job, drafting and engineer's assistants, clerical force, commission attorney and secretary, office rent, drafting work in advance of contracts, equipment and stores on hand, etc., etc.

The Commission furnishes materials to contractors to insure honest composition, to eliminate contractors' profits on materials, to get the benefit of purchasing in such large quantities, and to secure a half freight rate agreement with the railroads.

The inspection to insure honest work by contractors after honest materials have been furnished by the State, is done by a resident engineer on every job; and is very expensive, but is considered justified in view of future maintenance costs.

Proposed Extensions.—The State Highways Act of 1915 was passed to provide the \$12,000,000 needed to finish the State system of highways as proposed in the first act; but uncompleted as shown in the accompanying map. \$3,000,000 are added to be applied on a county aid proposition to build eight cross-state roads, four of which connect the interior main highway with the coast. This act will not be in force until voted on by the people in November.

POWER NOTES.

Increased facilities at the State Fair for displaying pumping plant equipment will be afforded this year.

The Yuba Construction Co. proposes to show at Nevada State Fair. Nine machines are being operated around Lovelock.

California automobiles registered up to July 19 totaled 194,507. A total of \$1,927,192 has been collected in registration fees.

A Marmon car was driven from New York to San Francisco in 5 days 15½ hours arriving July 29. The trip was approximately 3400 miles.

A Hudson supersix chassis was driven 1819 miles in 24 hours on Sheepshead Bay track May 2 by Ralph Mulford. Average speed was 75.8 miles per hour. The test was officially observed by the American Automobile Ass'n.

The Southern California Tractors Association held their meeting in Los Angeles July 18, and decided on holding a tractor demonstration in Los Angeles county the latter part of September. The location and date of this demonstration will be decided at a meeting held in the near future, at which time a definite date will be announced.

1 or 2 Row Beet Plow

**KILLEFER
QUALITY**

**KILLEFER
EFFICIENCY**

Was designed for the smaller grower where traction power was not available for handling the larger plows. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

We build this plow with either straight, sloping, or bent standards and with any style of wing or point required.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave., Los Angeles, Cal.

The Moreland Distillate Truck Will Make Money For You

In the dairying, fruit-growing and ranching business, the Moreland Distillate Truck is as indispensable to maximum profits as it is in the commercial world—which it dominates on the Pacific Coast.

In every business in which highway hauling is a factor, economy demands the supplanting of the horse by the motor truck. For Pacific Coast service, the Moreland is indisputably the peer of all trucks.

It is built on the Coast expressly to meet Pacific Coast conditions. It is sold direct from manufacturer to you, without middleman's profit. It operates on Distillate at about half the cost of gasoline. Being built right on the Coast, factory service and new parts are always immediately available.

Representative will call on request.

General Agricultural Review.

GRAINS AND FIELD CROPS.

A barley roller may be installed at Alpaugh.

Kings county has been shipping hay to Los Angeles.

Grain has yielded well around Grimes, Colusa county.

Rice fields south of Dixon are reported in good shape.

The Garvanza bean is attracting notice in Sutter county.

Colusa barley growers sold 25,000 sacks recently at \$1.40 f. o. b.

Rice fields in Marysville district have been thriving in hot weather.

A pea-threshing machine has been purchased for use around Salinas.

A thousand-acre sugar beet experiment is to be tried out near Merced.

San Joaquin county beans are threatened with red spider. Sulphur them.

Fifteen to forty sacks of barley per acre have been harvested around Gustine, Merced county.

Sutter county river beans are reported in fine condition and larger acreage than ever before.

A Le Grand harvester threshed 160 acres of winter sown barley in 4 days, getting nearly 17 sacks per acre.

The alfalfa seed crop through Lassen and Modoc counties is estimated at 2-3 of normal; but it is too early to judge rightly.

Alpaugh shipped about 80 carloads of sugar beets during the season just past. Growers are planning for beets on alfalfa land next year.

The rice rates of the S. P. and Santa Fe railroads will be considered at a hearing by the State Railroad Commission at Biggs Aug. 7.

It is reported that a large acreage of land in the Merced district will be planted to sugar beets next year for Tulare county sugar factories.

Some rot has been published about the "80,000,000 pounds of rice grown in California last year going to waste for lack of a market." It was practically all sold this spring.

Twenty thousand acres of sugar beets are proposed for the Corcoran and Visalia sugar factories which recently came under the same ownership.

A 40-acre field of rice is being grown at Chowchilla this year as an experiment on land that would otherwise be of little value for agricultural purposes because of its alkali.

The hay crop in the northeastern part of the State promises to be 1-3 short of normal. Some hay is being sold at \$7 to \$9 per ton in the stack. Some growers are holding for \$10.

Small shipments of sweet potatoes are being made daily from the Atwater district, producers receiving four cents a pound, f. o. b. Carload shipments will start within the next week.

Grain elevators have been completed at Athlone, Merced county, and Chowchilla, Madera county; and both are well filled with grain at present. The latter has a capacity

of 80,000 bushels. Because of the dryness of this climate it is not necessary to stir the grain in the bins as is the case in Eastern States.

DECIDUOUS FRUITS.

Dried peach buyers around Chico are offering 6 cents.

Tulare county reports a better prune crop than usual.

Ventura county reports some dried apricot sales at 14 cents.

Los Molinos is shipping about 10 cars of Elbertas this year.

Prune picking started last week on Sugars in Napa and Santa Clara valleys.

One shipper of Dinuba has been shipping a car of Tuscans per day to Armona.

Ventura county reports 1000 tons dried apricots as against 1870 tons last year.

For the week ending July 26, 98 carloads of fruit were shipped from Vacaville.

One company contracted for 10,000 boxes of Contra Costa pears for Eastern shipment.

Libby, McNeil and Libby have been employing 530 people at their Selma cannery.

Yuba City Tuscans are about cleaned up and the cannery has been packing Muirs.

At the meeting of prune and apricot growers at Campbell July 25, 22 growers signed up.

Elberta shipments of one company from Kings county to the East are estimated at 65 carloads.

The first car of pears ever shipped from Antelope Valley, Los Angeles county, went out last week.

Riverside Bartletts are expected to all be gone by Aug. 15. They are nearly a month earlier than usual.

The Kings County Packing Co. of Armona proposes to increase its capital stock from \$100,000 to \$250,000.

Butte County Horticultural Commissioner Earle Mills has bought 56 acres of "slickers" along the old Cherokee canal which he will plant to prunes.

A crate of Millard Sharpe's new Mammoth plums developed near Vacaville sold recently in New York for \$7.37 1/2.

The Cal. Peach Growers' modern packing plant at Selma was begun last week. It will be brick, 100x140 feet.

A Stanislaus grower is said to have sold 30 boxes nectarines from one tree in San Francisco at \$1 per box. He thinks he may plant 20 acres to this fruit.

The Banning Canning Co. opened for the peach season with about 200 employees. Muirs and Lovells are ripe and other fruits are ripening fast at the same time.

Fresh fruit shipments are reported by the Cal. Fruit Distributors for Jul. 26 as follows for 1915 and 1916 respectively: Peaches 11 and 85 1/4 cars; plums 28 1/2 and 28 1/2; pears 39 and 75 1/2; grapes 2 and 4 1/4.

Green fruit and cannery shippers shipped 65 carloads of peaches out of the Atwater district last week. Green fruit shippers are paying \$20 a ton and about half of the fruit leaving the district is for green fruit consumption. The peach crop in this district is variously estimated from 60 to 90 per cent.

Bankers offered the California Farmers' Union loans of 50 per cent of the market value of their prunes on warehouse receipts. With this substantial proof of confidence, the Union expects to pay members 2 1/2 cents on delivery, another payment about the time taxes are due, and if final settlement is not made within 60 days thereafter, another payment will be made within that time, according to Sales Manager W. S. Breton.

There is a difference of opinion in the East as to how high peaches can be sold without seriously injuring the peach market. Some letters at hand say that six-cent peaches are O. K., while others are pessimistic, largely a matter of where one's interests lie. Probably the best illustration of inconsistency on the part of California packers who are spreading this report, is the fact that they themselves are paying 6 1/4 cents, according to the Cal. Peach Growers, Inc.

CITRUS, OLIVES, NUTS.

The Esparto Almond Festival is no more.

Esparto almond picking is in full swing.

A 40-acre Butte county almond orchard recently sold for \$750 per acre.

The grinding walnut cracker at Goleta is to be replaced by one with a hammering action if the latter works as well as hoped.

Fumigation of 4,000 acres of citrus orchards in Tulare county has begun under inspection of Horticultural Commissioner Chas. F. Collins.

GRAPES AND RAISINS.

Esparto Sultanas are moving. Clovis Thompsons were practically cleaned up this week.

The first carload of Malagas from the Fresno district was shipped from Cutler July 28.

The new disease of Lodi Tokays has been diagnosed as stem sunburn and stem mildew.

Vacaville sent the first Tokay shipment of the season July 14.

The first Dinuba Thompsons sold in Boston at \$2.85 per crate.

A 34-acre San Joaquin county Tokay crop recently sold on the vines for \$6,000 cash.

The first car of Thompsons from Reedley left July 28. Grapes are ripening rapidly.

The first car of grapes from Livingston, Merced county, were Thompsons and Malagas shipped July 26.

Lodi Tokays are coloring and sugaring rapidly and carload shipments are expected soon after the middle of the month.

Clovis shipped a car of Malagas July 28. Some of these tested over 20 per cent sugar. Seventeen per cent is the legal minimum.

Seeded raisins in tin cans are being produced by the Kings County Packing Co. and advertised as keeping their freshness, and flavor better than in cartons.

A 40-acre Thompson crop in Imperial county was sold on the vines at \$30 per ton, yielding \$105 per acre. They went out a month or six weeks before grapes from any other part of U. S.

Concord grapes grown on the Gibson ranch near Litchfield, Honey Lake Valley, contain 19.4 per cent sugar, said to be over 4 per cent higher than Eastern Concord. They have proved to be good bearers. Twelve acres are set to this variety on the Gibson ranch.

CORN

Harvester cuts and throws in pile on harvester or windrows. Man and horse cuts and shocks equal to Corn Binder. Sold in every state. Price only \$22.00 with folder binder. Testimonials and catalog FREE showing picture of Harvester. PROCESS MFG. CO., Dept. 262, Salina, Kansas.

MISCELLANEOUS.

The Dean Iris Gardens of Moneta have recently put out a little booklet listing 162 named varieties.

A Long Beach man claims to have found that toads are better than sprays, etc., to control garden snails.

The Tulare County Bee-keepers' Ass'n recently contracted their crop of at least 10 carloads of honey at a trifle over 6 cents per pound.

A. B. Humphrey of Escalon recently planted 100 acres of corn on his Berkshire-Guernsey ranch; 50 acres are Indian corn for silage.

Work has commenced on a trail between Lake Tahoe and Yosemite Valley along the summits largely at an elevation of 6,000 to 7,000 feet.

Merced county supervisors will hold a hearing Aug. 9, 2 p. m., to learn whether farmers want concerted action against ground squirrels.

A Berkeley rose grower is said to have produced a variety which is deep copper colored mornings and evenings, but dark red in the afternoons.

Glenn and Tehama counties are proposing a system of cruising the land to get equitable valuation of farm lands.

Practical work done by boys and girls on the farm should, and does in some places, count as grades and credits in their school work, according to U. S. Dept. Agr.

A Santa Maria (Santa Barbara county) farmer is suing for \$10,000 damages against two men who are accused of scattering wild morning glory seed over his ranch.

The Farm Advisers of seven counties met Yolo County Farm Adviser N. P. Searls July 25 and were shown what State Leader of Farmer Advisers B. H. Cocheron said was the best bunch of farm bureau demonstrations in the State.

Because a large part of the land in the Atwater district of Merced county is being made worthless by sub-irrigation and seepage water from the main irrigation laterals, the owners of 7000 acres in that section have formed a drainage district and will start work digging ditches in the near future.

In order to rid the large areas of unsold land in the Chowchilla district of rabbits and squirrels a bounty of five cents each is being paid for rabbits and a large crew of men are working under the supervision of the U. S. Bureau of Health, spreading poisoned grain on the burnt over grain stubble.

HARDENING TREES FOR WINTER.

To the Editor: We have some walnuts and pears in the west end of San Fernando valley, set out last April. How many times should they be watered before they go into the dormant state? We have watered them twice already, the last time was July 1.

We also have 10 acres of oranges and 5 acres of lemons, the trees being 25 ft. apart in form of a square. What would be your opinion of setting a tree in the center of each one of the squares? How often should citrus trees be watered and when commence to harden them for winter?—O. B., Owensmouth.

[If you keep the ground among your walnuts and pears moist deep down until late September, they will go into the winter in good condition. There is no need of throwing them dormant earlier than that as you would lose that much growth.

If we had citrus trees on 25 foot squares, we would not plant anything in the squares from which we could not reap profits the first year. In other words, we would not plant trees at all, but would plant garden crops or cover crops to improve the soil and fertility.

Citrus trees should be watered

often enough so that they do not suffer, remembering that the water should go down as deep as the roots will follow it, which is more than three feet.

Let suckers grow after September in order to harden the wood for winter, but we would not attempt to harden it by withholding water.]

German farmers have for years been borrowing money and repaying enough principal yearly to clear the debt at a given time, reducing interest yearly. Such a system is now available in Cal.

26 Extra Features
73 New Conceptions

Mitchell

MID-YEAR
MODEL

\$1325
F.o.b. Racine

The Expert's Car

This Shows What Men Think of a Bate-Built Car

Most of the Mitchell sales in cities are made to very able men.

Our Chicago dealer, in one week, sold Mitchells to five big bankers. Our New York dealer—in the home of the critical—has ordered 2000 of this Mid-Year model.

Your nearest Mitchell dealer has a list of engineers—men of national fame—who selected the Mitchell. They chose this car, among 400 makes, because of its mechanical perfection.

Due to John W. Bate

The Mitchell's position among shrewd buyers is due to John W. Bate.

This great efficiency engineer designed all our factory buildings. They now cover 45 acres. He equipped those buildings with 2092 up-to-date machines. He trained our workmen.

The result is a model motor car plant. He has reduced our factory costs 50 per cent. No other plant in America, we think, could build such a car at our cost.

That is why such a car can be sold at our price. And why it includes 26 costly extras without any extra price.

Extra-Strong Parts

In the car itself Mr. Bate has worked out more than 700 improvements. He has spent 13 years on it. This is his 17th model.

Hardly a casting remains in it. But 440 parts are either drop-forged or stamped from toughened steel. He allows big margins of safety. He uses much Chrome-Vanadium steel. Important parts are all made oversize. The result seems to be a lifetime car. Six Mitchells have averaged 164,372 miles each, or over 30 years of ordinary service. And they are running still.

That is why men who get expert advice are buying this Mitchell now. They want a car which John W. Bate calls, "The best car I can build."

Now 73 New Touches

The Mid-Year Mitchell is our second 1916 model. It was completed after other new models came out. Our experts examined 257 of the latest models to get ideas for this.

So this Mid-Year Mitchell combines all the best attractions brought out in this year's cars.

In addition, it has 26 extra features—things other cars omit. Things like a power tire pump, cantilever springs, an extra-cost carburetor, an easy control, a ball-bearing steering gear, etc. You will find here the most complete car shown. You will find beauty, luxury and comfort in extreme. You will find the car which you will want when you buy a car to keep. Go see it. If you don't know your Mitchell dealer, ask us for his name.

Best Cow Ration Explained.

To the Editor: What is the best and cheapest grain ration to feed my cows for best results? Am feeding all the green cut alfalfa they will eat, with a small amount of red oat hay, also five sacks each of middlings and cocoanut meal per month to 10 cows giving 8 to 45 pounds milk. Prices here: cocoanut meal \$32 per ton, rolled barley \$30, bran \$30, middlings \$36.—J. C. N., San Jose.

[Answered by E. C. Voorhies, University Farm, Davis, California.]

[A good grain mixture with the feeds given would be 200 lbs. barley, 100 lbs. bran and 100 lbs. cocoanut oil cake meal. The price set for your cocoanut meal is too high and you should be able to obtain it more cheaply. It is sold around San Francisco for \$24.00 per ton, and the freight to San Jose should not be \$8.00. Middlings are too high priced usually to feed to dairy cattle, and your cows will probably do as well on the ration suggested as on the one which you are now feeding. In a short while dried beet pulp will be available and the following ration will give very good results:

Equal parts of barley, bran, beet pulp, and cocoanut oil cake meal, by weight.

The beet pulp should be obtained as cheaply if not cheaper than what you are now feeding. The last named ration has been fed on the University Farm for some time with success.

To the best cows one should give about one pound of this mixture or other concentrate for every 5 or 6 pounds of milk that the cow gives, up to the point where 8 pounds of grain is given per day. It rarely pays to feed much more than this amount.]

DAIRY TENANT PROBLEM.

[Written for Pacific Rural Press.]

To the Editor: What is a reasonable share proposition on a dairy ranch where the tenant furnishes half the stock and does all the work of caring for the stock and putting up all the hay? There are 80 acres in the ranch and about eight acres in the orchard that was set out last year which the tenant has to care for.—G. E. H., Modesto.

[It is customary for the owner to furnish the land and cows, giving the tenant half of everything grown on the ranch. As the tenant in this case is to furnish half the cows as well as do all the work he should, we believe, receive half the income together with interest and depreciation charges on the cattle he furnishes. For illustration, if there are 50 cows in the herd and 25 of them belong to the tenant and have a valuation of \$75 each the land owner should pay six per cent interest on the investment plus ten per cent depreciation on the total valuation of the tenant's stock or about \$300 annually. Half of the heifers would belong to each party interested. By this arrangement, the land owner would simply pay a fair rental to the tenant for his cows. As the orchard is a young one the tenant should be paid for all work done in it till it comes into bearing.

We quote general principles as written for your query by Prof. R. L. Adams of the University of Cal.:

In determining the proper division of profit or loss in cases of leased land, a clearer understanding of what each party is rightly entitled to

will result if the various items entering into the deal are tabulated at correct figures, based upon careful estimates of forthcoming expense, or just valuations of present investments. The interest of each partner can then be determined therefrom.

Each party is rightly entitled to:

(a) Repayment for all labor—manual and supervisory.

(b) Repayment of all moneys paid out for operating expenses—sacks, twine, seed, fertilizer.

(c) Interest on all moneys invested in land, improvements, stock, implements, and the like, based upon fair valuations, and the going rate of interest.

(d) Interest on all moneys advanced for operating expenses—feed, material, labor, harvest, and the like.

(e) A sum to offset depreciation of plant—buildings, implements, stock, and the like.

Thus in the case mentioned it will be necessary to tabulate all items entering into the business and from this determine the share of each.

In general, the safest and fairest basis of what constitutes the proper disbursements of farm receipts between lessor and lessee is to repay each partner according to the share put into the business. The owner usually offers land, possibly buildings or other improvements, sometimes livestock, and occasionally feed. The tenant, as a rule, supplies labor, sometimes working equipment and operating capital.

Each is entitled to a reasonable rate of interest to the extent of his capital, to a sum for depreciation (reasonable wear and tear), and to replacement of any items the use of which exhausts capital, as seed, sacks, fertilizer, and the like, and to reimbursement for labor.

In figuring out a given scheme care should be exercised that only correct data be used, and that due allowance be made for overcapitalization of land, labor and all items necessary to the proper planning of the scheme.]

SHIPPING BEEF CATTLE TO EASTERN MARKETS.

[Written for Pacific Rural Press.]

While shipments of beef cattle from California to Omaha, Kansas City, and even to Chicago from central California are rather limited in size, it is nevertheless interesting to note that from Merced county alone shipments East this year have amounted to over 125 carloads.

Quoting a member of the firm of Robinson Bros. of Merced, who sell cattle most every year for Eastern shipments but do not ship on their own account, "There is a psychological time each year for the shipment of California cattle East. Usually June 10 is that time, as the markets at home are nearing their lowest ebb, the cattle are in prime condition, having fattened on dry grass and usually go back from that time on, and the Eastern markets are usually close to the high point at that time."

It is usual to ship heavy cattle, the weights running around 1300 pounds or better. There are three primary reasons for these heavy steers being shipped: (1) because the freight rate per pound is less, freight being paid at the car rate and more weight being secured per car with the heavy steers; (2) older steers stand the long shipping better than younger stuff would; (3) the Eastern market for heavy cattle has usually been good at that time of year.

Tuberculin testing under the new law will be done by the State free of cost.

It has been fully demonstrated in California that a Silo

KNOB HILL STOCK FARM Registered Big Type Poland Chinas : : :

SOME TYPICAL KNOB HILL BROOD SOWS.
(Large type, combined with high quality.)

Our herd is nominated in the California Poland China Futurity to be held in connection with the State Fair this fall. We have just imported and added to the herd some of the best blood of the East, including boars from W. J. Hather, Ord, Neb., and Peter Mouw, Orange City, Iowa. We are offering pigs of both sexes from prize-winning stock. Litters coming at all seasons and stock usually on hand to suit customers.

Come and see them, or write for what you want.
ALL STOCK REGISTERED. ALL BREEDING GUARANTEED.
A. M. HENRY, Prop. Farmington, Cal.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and proven transmitting power of their ancestors. PRINCE GELSCHER WALKER, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by KINTYRE LAIRD, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality, the herd is unexcelled in the West. At the head of the herd is BANKER'S BOY, junior champion and reserve grand champion at P. P. I. B.

Woman Raises Hogs Successfully.

[Written for Pacific Rural Press by Glenn F. Smith.]

Mrs. Della M. Foster of Holtville claims the distinction of being the Hog-queen of Imperial Valley. Mrs. Foster, formerly a breeder of Hampshires in Indiana, has a 160-acre ranch unusually well equipped. Everything found by experience to be suitable for her locality has a place on this ranch. It is fenced hog-tight into small fields with plenty of shade for every field. All buildings have concrete floors; are whitewashed inside and out, and all pens are equipped with running water from artesian wells.

This ranch supports 900 grade Hampshires. Out of 85 sows that farrowed recently, all but 3 raised good litters. Sows, all good individuals and cholera-immune, run in alfalfa up to a week or ten days before farrowing, when they are thoroughly disinfected and placed in disinfected pens unusually clean and well kept until pigs are ready to wean. Pigs are immunized a week before weaning.

After weaning time sows are turned into alfalfa and allowed 3 weeks' rest before breeding. Pigs are placed in pens where they have plenty of exercise, shade, and are fed all the soaked ground barley and cracked milo they will eat; until they reach an average weight of 75 pounds. Then they are turned onto alfalfa, and barley stubble until fattening time. Mrs. Foster recently shipped 2 carlots that averaged 180 pounds at seven months.

Her rules for success in the hog business in Imperial county are: (1) Disinfectant is cheaper than disease; (2) feed abundantly and with regularity; (3) provide shade and all the fresh, clean water the hogs will drink; (4) market as early as practicable.

All the feed necessary to keep the 900 hogs is raised on the 160 acres, except stock-food and disinfectant.

DO YOUR PIGS "EAT THEIR HEADS OFF"?

[Written for Pacific Rural Press.]

Everybody who is endeavoring to make economical gains of pork should have a pair of scales, is the belief of progressive farmers who are in the pork-making business in either a large or small way.

True enough, most any feeder can tell by observation whether a hog is gaining or not, but whether such gains are being made most economically is another question.

An acquaintance tells of a neighboring farmer who became enthusiastic over hogs, thinking that he could buy a carload of feeders and by the use of self-feeders, make

economical and satisfactory gains.

The hogs were purchased and turned into pens with the self-feeders and alfalfa pasture. For three weeks everything went well and then the feed bill began to scare the feeder. Having no scales he did not know how many pounds a week he was adding to each hog, but he did know how much money it was costing.

With that knowledge he sought our acquaintance, telling him of the feed bill and asking for advice. Learning that he had no scales but was obsessed with the one idea that they were "eating their heads off," he was advised to sell them half finished. As our acquaintance remarked, "He wouldn't find out whether the heavy feeding was justifying itself, and it's better not to feed hogs at all if you go at it half-heartedly."

And that's the truth. Too few farmers adjust the feed sack to the actual pounds of pork produced. Oftener they adjust it to the regulation of the stingy fist; and as a result the pigs go to market half fed, half fat, and weighing much less than they should.

BUSINESS MEN PROMOTE COW-TESTING.

[Written for Pacific Rural Press.]

What is perhaps the first concerted action ever taken by bankers and business men of a California city toward the promotion of a county cow-testing association is the one being undertaken by the Chamber of Commerce of Merced.

H. P. Spencer, a banker of Merced, who is chairman of the cow-testing committee of the Chamber of Commerce, believes that the community would be materially benefited by a co-operative culling out of "boarder" cows and states that the committee is compiling data on the work of other associations and that in the near future subscriptions will be solicited and the organization perfected.

It is worthy of note that while many of the business men of California are not directly interested in dairying, they have large amounts of money loaned to farmers who depend upon cows to meet their obligations. It is with the understanding that a dairyman with poor cows is apt to be a poor customer that the merchants of Merced are lending their moral and financial aid to the cow-testing work. It is to be hoped that dairymen will see the advantages of such work and give it their support, also that business men in other districts may learn something from Merced's pioneering.

BOARD HOG FENCES.

[Written for Pacific Rural Press.]

Never use wire fencing to enclose small hog pens, is the advice of W. W. Everett, manager of the River Bend Farms at St. Helena.

When he built his farrowing lots a year ago he set posts close to each other and used heavy hog-tight wire, stretched tight. Since then the sows have used the wire for scratching purposes to such an extent that it is practically destroyed. "I'll use boards next time," says Mr. Everett.

The Ideal Green Feed Silo

BECAUSE OF ITS

PROPER DESIGN BEST MATERIAL and GOOD WORKMANSHIP

will serve you better than any other.

It will give you longer service, a better quality of silage and more profit on the investment than any "cheap" silo. This has been proven by the experience of many farmers who have tried both.

In the better silage it will produce the Ideal will save the difference between its cost and that of any inferior silo the first season you use it

Everything for the Dairy.

1 Gal. more milk per Cow - at 33 1/3% less Cost

That's
what

Mr. W. F. Eldridge
of the Premier Ranch,
Corona, Cal., says about
Larrowe's Dried Beet Pulp.

—Hundreds of other dairymen
will tell you of similar satisfactory
experiences with this succulent vegetable feed. It not only increases the
production of milk but improves the
health and physical condition of
the cow.

ALFALFA & DRIED BEET PULP

—a perfectly balanced ration.

—Official tests by experiment stations and well known authorities prove that a ration composed exclusively of alfalfa and dried beet pulp contains the proper proportion of elements necessary to enable a cow to do her best. Silage is not needed, for dried beet pulp has equal or greater succulence with five times as much nutriment.

—Read what one of California's most noted breeders says:

"We do not consider corn silage an economical feed where dried beet pulp can be obtained for \$30 per ton or less; for the simple reason that it is necessary to supplement a ration of alfalfa and corn silage with a liberal ration of high-priced grain in order to get the cows to do their best, while even the heaviest producing cow will give practically as much milk on a ration of only alfalfa and dried beet pulp as on the most concentrated grain ration. We have proved this absolutely by the official scales and test."

—Test it for yourself. Go to your feed dealer and order a single 100-lb. sack. Ask for "Larrowe's." Try it with one cow whose milk record you know—and watch results.

DAIRYING AND DAIRYMEN.

Tuberculin testing under the new law will be done by the State free of cost.

Two Fresno county dairymen were recently fined for not cooling their cream.

The Chico Creamery has consolidated with the Velvet Ice Cream and Butter Shop.

Two Monterey county cheese-makers have been arrested for using unclean milk.

The Orland Cheese & Butter Co. paid \$10,689.39 to patrons in June for butterfat.

Alexander & Kellogg will show Dairy Shorthorns at Solano county fair Aug. 16-19.

A. W. Morris & Sons shipped a 16-months Holstein bull July 27 to J. K. Newman of Louisiana.

Three Kings county dairymen were fined last week for not cooling and keeping their cream cool.

The Henderson Co. of Sacramento has engaged C. Kohlbeck of University Farm to make cheese on their ranch at Elliott.

A. W. Morris & Sons of Woodland recently bought the Judge Curtis H. Lindley herd of 62 head of registered Holsteins through D. O. Lively.

The Madera Co-operative Creamery is turning out 1200 pounds of butter daily. A goodly portion of this is coming from the Chowchilla district.

A Fresno county man on horseback was knocked out with his horse by an angry bull. A Merced county man was killed by a bull about the same time. Better be safe than dead.

The recently reorganized creamery at Merced is churning about a ton of butter a day, a large portion of which is being sold to the lumber companies in the mountains back of Merced.

The Jersey cow "Surprise" owned by D. H. Bitner of Kern county led in the cow-testing association 30-day contest by producing 64.8 pounds butterfat. A Durham produced over 60 pounds.

Two 20-pound (butter) two-year daughters of King Walker Segis will be included in McAlister & Sons' sale at Rivera Sept. 19 and 20. Four of this bull's first crop of daughters have made over 20 pounds butter as two-year-olds.

Work has been commenced on the new creamery building at Chowchilla, Madera county, which will be ready for operation some time the coming fall. It is said that most of the alfalfa growers in that district are either already in the dairy business or contemplate going into it.

The first annual sale of registered Holsteins from the Frank Helm herd at Fresno will be held September 12; and will consist of 75 head, of which 60 will be females and 15 males. All of the animals in this sale will be tuberculin tested and 14 of the females will be A. R. O. cows. Except 10 heifers, the females will be three to seven years old. There will be seven granddaughters of King Segis in the offering and seven grandsons of the same bull, also three daughters of Prince Beauty Pietertje Segis. Mr. Helm states that he has secured the services of Col. Ben Rhoades of Los Angeles as auctioneer. As Mr. Helm's herd now numbers 300, there should be a choice lot of Holsteins in this sale.

THE LAWRENCE-WILLIAMS CO., Cleveland, O.

SWINE AND SWINEBREEDERS.

S. G. Owens of Madera is breeding purebred Durocs.

Hogs are reported to have been selling at \$7.50 per hundred in the yards at Elmira.

Le Grand farmers thought their herds had cholera; but only small pigs died and the trouble is about over.

"It is not economical to try to produce growing pigs or fattening hogs on dry pasture," says Washington Experiment Station.

A number of hog cholera outbreaks about Riego, Placer county, have been prevented from becoming epidemic, by vaccination.

Hogs fed all the grain they will eat make more rapid but less economical gains. This may enable them to be marketed at a better time.

Simple dipping often does not cure hog itch according to Arizona Expt. Station because the mites which cause it are too deep under skin or scabs.

The cost of producing 100 pounds of pork with corn and tankage was 60 cents less than when corn alone was used at Missouri Experiment Station.

Ben F. Thorpe of the Canfield Estate, Bonsall, reports that they have purchased a son of the Hampshire Messenger Boy from Iowa for herd sire.

D. O. Lively of San Francisco recently exported three Poland China sows and two boars to Guayaquil, Ecuador; also two Poland China sows and one boar to Valparaiso, Chile.

J. E. Rodefer of Yuba City started last November with 15 Poland-China-Chester-White brood sows on a 500-acre grain ranch. He now has 130 sucklings, and is an enthusiastic pork raiser.

Mark Requa of Oakland is establishing a herd of registered Berkshires near Orland. The herd sire is White's Longfellow's Model; and several sows will farrow pigs sired by Mayhews Leader Sixth.

Rape pasture replaced 64 pounds of corn in every 100 pounds gain made by hogs in an 11-week experiment at Ohio Expt. Station. An acre was found able to supply green feed for 30 100-pound hogs for three months.

In establishing his new Poland China ranch, O. L. Linn of Modesto made it a point to take advantage of eucalyptus shade. He has purchased a Big Joe boar from Judge Kemp, but cannot ship him until fall on account of hot weather.

That the Fresno District Fair is going to make a feature of its swine show is the advice received from Secretary C. G. Eberhart, who says that he has secured the services of Fred C. Gatewood, an experienced livestock show man, whose work will be confined exclusively to the swine department. A new hog barn with a capacity of 150 head is being constructed which with the other barns will make room for 250 head.

HORSES, SHEEP, CATTLE.

T. S. Glide will show Shorthorns at Solano county fair.

J. Bidegaray of Fresno has sold all of the rams recently advertised in our columns.

R. Barry of Golconda, Nev., has been appointed sheep inspector with headquarters at Golconda.

Cattle are now imported from Colombia for use in the Canal Zone, cheaper than from New York.

Salinas valley men are saying that they can sell three-year mules for cash enough to buy five-year mares.

D. B. Harris, manager Sierra Vista Vineyard, Madera county, is going to

be on the Hereford map in a big way pretty soon.

Grasshoppers are eating cattle and sheep feed in the Lake Tahoe region.

Porterville cattle men shipped about 750 fat cattle to San Francisco last week.

Annual co-operative cattle sales in S. C. have shown that, if farmers can be assured of a profitable market, they will feed cattle on cottonseed meal and hulls, silage, and other strong feeds.

GENERAL LIVESTOCK.

Solano county will not have a county exhibit at the State Fair, for lack of funds.

Eastern Oregon is entering a new campaign of coyote extermination on account of rabies.

The Cudahy Packing Co. will soon begin a \$20,000 meat smokehouse and a cooking plant in Fresno. San Bernardino and San Diego expect similar plants.

The Napa County Fair will have no races. Its central interests will be in exhibits of farmers. In this it is courageously undertaking the true province of a county fair.

The number of cattle in U. S. has been slowly increasing since 1912, and the causes of this are still in active operation, says the Chamber of Commerce of the U. S.

The Modesto Farmers' Union is planning a county auction sale to be held monthly to dispose of veal calves, cows, hogs, sheep, chickens, second-hand implements, etc. The first is planned for early September.

GREAT BERKSHIRE SALE.

The Berkshire sale, held August 2nd at W. M. Carruthers' farm near Mayfield, was a pronounced success. There was a good attendance from all sections of the State, the stock offered was of outstanding quality, Auctioneer Hord was in fine fettle, and L. E. Frost of Chicago was an able ring general.

Too many animals were catalogued for the limited time of the sale, so eleven head of boars were not offered. The 36 head of boars and sows sold brought an average price of \$178.33; total sales amounting to \$6420. Jas. Mills of Willows was the largest buyer, bidding in over \$3000 worth. Other buyers were Mark Requa of Orland; E. R. Sheldon of Sonoma; D. O. Lively and E. O. McCormick, San Francisco; Chas. Turner, San Jose; H. L. Hill, Los Altos; D. B. Wentworth, Napa; C. A. Thayer, San Rafael; J. M. Bomberger, Modesto, and others. The highest price paid was \$400 for a gilt, farrowed Sept., 1915. The success of this sale will doubtless stimulate others, but it is doubtful if the prices received will be exceeded for some time. Mr. Carruthers is to be congratulated upon his success.

STARVING WOMEN IN ALBANIA.

To a Good Samaritan:

A nation is dying of hunger. It is a small, weak nation, and its call for help is unheard among the stronger appeals of its powerful neighbors, in their sudden, recent sufferings. For three years the country of Albania has been the victim of sword and famine. Now, the people are without food. Ten thousand human beings are starving daily.

The women are emaciated; their bones seem about to protrude through the skin. Would you give bread to one famished woman, save for her a child as dear to her, as yours to you? Would you win a grateful look from the appealing eyes of her in whose wasted hands you place the gift?

Give one hundred cents to buy flour for Albania. If you have given to other countries until you feel that

Johnson-Bermuda Pig Pasture.

To the Editor: What is the value of Johnson grass and Bermuda grass as compared with other pasture? I understand that they make pretty good pig feed. I have a lot of land covered heavily with Bermuda grass, and since I need a lot of pig pasture would it not be just as well to use it for this purpose instead of trying to kill it by plowing?—E. L. San Francisco.

(Answered by Prof. P. B. Kennedy, University of California.)

[Both Johnson grass and Bermuda grass are nutritious. In the northern part of the State Bermuda grass does not grow tall enough to make any considerable bulk of forage, but in the southern part where there is a longer growing season, and a greater number of warmer days, it makes a very satisfactory and substantial growth. Bermuda grass does not enter the ground deeply, and hence as a feed for hogs would not be likely to produce the same bulk of forage. Johnson grass extends into the soil for several feet and produces large, succulent roots. It is these that the hogs root for and eat with considerable relish and nutriment.

If you want to get rid of these grasses, one of the best means to lessen their vitality is to pasture them heavily. When they have been thoroughly subdued in this manner, you will find that eradication by plowing or other means will be greatly hastened.

Bermuda grass will compare favorably with any of the known pasture grasses as a food. The only real objection to it is the difficulty in its eradication when the land is desired for other purposes.

Johnson grass, because of its coarser growth, could not be considered as good a pasture for sheep or cows as Bermuda, but the roots make it quite valuable for hogs. The ground, however, would have to be of such a nature that the hogs could readily feed on the roots; or it might be plowed to allow freer access.]

RULES AND PRIZES, STATE COW COMPETITION.

(Continued from first page.)

Special Prizes in dairy bull calves, dairy apparatus, feed, trophies, etc., are contributed for the purposes and by the people as follows:

Purebred Bull Calves.—For the highest average production of butterfat during 10 consecutive months, by a grade herd of 10 to 25 cows headed by a purebred sire, four prizes, choice of: An Ayrshire, Guernsey, Holstein, or Jersey bull calf—donated respectively, by J. W. Clise, Seattle, Wash.; A. B. Humphrey, Escalon; K. W. Abbott, Milpitas; and N. H. Locke Co., Lockeford.

For the highest average production of butterfat during 10 consecutive months, by a grade herd of more than 25 cows, headed by a purebred sire, four prizes, choice of: An Ayrshire, Guernsey, or Jersey bull calf, donated, respectively, by E. B. McFarland, San Francisco; W. H. Saylor, San Francisco; C. G. McFarland, Tulare; and of \$100 worth in purebred Guernsey or Hampshire males, donated by Dr. J. W. Henderson, Berkeley.

Milking Machines, Cream Separators, Feeds.—For the two herds having the largest and next to the largest number of cows producing over 300 pounds of butterfat in 10 consecutive months, two prizes, choice of: A 2-unit outfit of the "Calf-Way" Milker, donated by the

"Calf-Way" Milker Company, Chicago, and a 2-unit Sharples Mechanical Milker, by the Sharples Separator Company, West Chester, Penn. Milking machines are awarded for use in winner's herd only.

For the highest average of butterfat by 10 cows in a grade herd, five prizes (winner of first three cash prizes barred), choice of: A No. 35 Iowa Cream Separator, capacity 850 pounds per hour, donated by the Associated Manufacturers Company, Waterloo, Iowa; a No. 5 Simplex Iowa Cream Separator, capacity 850 pounds per hour, by Baker & Hamilton, San Francisco; a No. 6 Anker-Holth Cream Separator, capacity 600 pounds, by Beck Hardware Company, San Francisco; an M-2 Baltic Cream Separator, capacity 300 pounds per hour, by the Empire Cream Separator Company, Bloomfield, N. J.; a No. 2 Primrose Cream Separator, by the International Harvester Company of America, San Francisco.

For the highest average production of three cows in the same herd, 2½ years to 3½ years old at the beginning of the competition: A No. 15 De Laval Cream Separator, capacity 675 pounds, donated by the De Laval Dairy Supply Company, San Francisco.

For the highest production of butterfat during 10 consecutive months by a cow entered in the competition, 5 tons of Larowe's Dried Beet Pulp, offered by the Larowe Milling Company, Los Angeles, provided, that if the winner of this prize consumed not less than one half-ton of Larowe's Dried Beet Pulp in her ration during the record period, the quantity to be awarded shall be increased to 15 tons.

Special Cash Prizes.—For the highest production of butterfat during 10 consecutive months by five cows in a herd, bred by the owner, three prizes: \$150 each for (a) purebred cows, (b) grade cows, (c) cows irrespective of their breeding—offered by the Country Life Department of The Sacramento Bee, Sacramento. No cow shall compete in more than one of these groups.

For the highest and next to the highest production of butterfat during 10 consecutive months by a cow in the Imperial Valley, two prizes: \$25 and \$15, offered by Barber & Thomson Company, Los Angeles.

For the highest average production of butterfat by 5 cows in a grade herd, headed by a purebred sire, during each calendar month, November, 1916, to February, 1918, inclusive: A cash prize of \$25 per month, donated by the Pacific Rural Press, San Francisco—The same individual cows shall compete only once for this prize.

For the highest production of butterfat for one year by herds belonging to a cow-testing association, three prizes: One hundred dollars each for herds of (a) 10 to 25 cows, (b) 26 to 50 cows, (c) over 50 cows; offered by the California Cultivator, Los Angeles. Association records for twelve consecutive months during the period of November, 1916, to February, 1918, will be considered in the award of these prizes; entries to close February 28, 1917. All heifers and cows in milk during six months or more must be included in the average for the herd.

For the highest production of butterfat by a grade cow for each month during the year 1917: A cash prize of \$10 a month, offered by McAlister & Sons, Chino. Records made by the same cows shall only be considered once in the award of this prize.

(a) For the highest average production of butterfat by ten cows in a grade herd, headed by a purebred bull out of a dam with a semi-official yearly record at least 10 per cent in excess of the average butterfat production of the herd, and (b) For the highest average production of butterfat by ten cows in a registered purebred herd, covering ten months: Two prizes of \$150 and \$100, respectively, offered by the Livestock and Dairy Journal, Sacramento.

Trophies and Medals.—For the highest production of milk during 10 consecutive months by a cow irrespective of her breeding: A silver trophy, donated by Scott, Magner & Miller, San Francisco, California.

For the highest records of a registered Jersey cow and by 10 cows in a grade herd, sired by a registered Jersey bull: Two cups, offered by the American Jersey Cattle Club, New York City, New York.

For the highest records by a registered Guernsey cow and by 10 cows in a grade herd, sired by a registered Guernsey bull: Two trophies, offered

by the American Guernsey Cattle Club, Peterboro, New Hampshire.

For the highest records by a registered Holstein cow and by 10 cows in a grade herd, sired by a registered Holstein bull: Two silver cups, offered by the Holstein-Friesian Association of America, Brattleboro, Vermont.

For the largest production of butterfat during 10 consecutive months by a cow bred by the owner: One gold medal.

For the largest production of butterfat during 10 consecutive months by 5 cows in a herd, bred by the owner: One gold medal.

Hog Cholera Its Own Prevention

The Inter-State Vaccine Co., at their Hog Stock Yards at Kansas City, ship out one hundred thousand stock hogs a year and guarantee every one of them to be immune from Cholera. Now, then, if we did not do this successfully, our business would not keep up, but instead, it has grown from 7,000 to an immense business. Now in this country, our work has shown the same success, and we wish to help all Hog raisers that we can reach. There is no "if." The Scientific system the Inter-State Vaccine Co. has in making their high potent serum, and the device in which we apply it, is evidence of our success in all Eastern and Middle States where we do a very large business. We have come now to California to help in the suppression of Hog Cholera. We teach the hog raiser how to vaccinate his own hogs—Free.

Blake, McFall & Co., Portland, Oregon

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

MARE BREATHE HARD.

To the Editor: I have a mare which I think has heaves. She pants, breathes hard, and coughs when on dry feed; but is better when on green feed.—E. W. C., Patterson.

[There is no cure. The green feed will give her the best relief.]

CREAM THIN.

To the Editor: A cow had a calf 12 days ago and is in splendid condition; but her cream is very thin, though heretofore it has been very fine.—F. W. M., Graton.

[Her trouble will probably pass off in a short time.]

ALFALFA MEAL IMPACTION.

To the Editor: Does alfalfa meal ever ball up in cattle's stomachs and kill them?—H. E. R., San Francisco.

[A cow can become impacted on this as well as any other food.]

DIGESTIVE TROUBLES.

To the Editor: April 1st I purchased a cow which was in good condition and apparently healthy. May 25 the dealer that I purchased from examined her and advised me to start drying her up, as he said she would be fresh within two months. She was then giving 20 lbs. of 4 per cent milk a day and when I skipped a milking the milk would leak from her teats. I hadn't made much progress toward drying her up in a week's time, when she got off her feed and bowels didn't move freely. She also seemed to have trouble urinating and there was a foul odor about her and she had cramps in her hind legs. I dosed her with salts a couple times and at present am feeding a little green alfalfa once a day thinking it will help her bowels, which now move freely but in small quantities. As she won't eat any grain or mash I am unable to give her medicine except by drenching. I still have to milk her out every few days to keep her udder from caking. The cow has lost flesh. She now eats hay fairly well, but only about half what a cow of her size should. She seems well and chews her cud all right. She seems no nearer calving than when I started drying her up. Do you think that drying up a cow giving this quantity of milk would disorganize her system in this manner? And can you advise what is her trouble and how to treat her?—E. J. W., Ripon.

[The trouble was not caused from drying up. It is digestive. Give her two pounds epsom salts dissolved in a gallon hot water at one dose.]

EYES RUN AND BLEED.

To the Editor: A mare's eyes run, and get very sore as soon as warm weather begins each year. They seem swollen and granular under the lids, and the tissues surrounding the eyes, and the eyes become whitish. Flies keep the flesh raw and bleeding from the corner of the eye down several inches along nose bone. I have tried boracic acid for washing the eyes and various ointments to heal flesh, and keep flies off, but of no use. The running of the eyes washes off the ointments. A veterinarian washed out the tear ducts several summers ago, but it was a temporary relief. She is a good mare during the cool months, but scarcely worth her feed from May to October.—C. S. M., Dinuba.

[Give this mare one dram of potassium iodide dissolved in water three times a day for ten days. Place a few drops of a 25 per cent solution argyrol in the eyes three times a day.]

NERVOUS MARE KICKS.

To the Editor: Mare—not young—developed habit of vigorously kicking when hitched, especially when first brought to standstill. Animal is inclined to be nervous standing in stall, ears twitching, sometimes tail switching, etc. Just before getting so bad, displayed uneasiness when standing hitched—pawing, looking around, etc. Fed grain hay in spring, alfalfa now. Light worked. Weighs perhaps 1300. In good condition, looks fine. Veterinary who saw one of her kicking tantrums remarked that a little operation would remedy that. What did he mean? Is it likely that this is due to some physical cause? What would be the nature of the operation and probable cost? Mare a bit inclined to be mean always, but until this spring perfectly workable and steady. Woman not used to horses could drive her nicely hitched to buggy. Afraid of nothing. Stand anywhere.—A. A. J., Turlock.

[This is nymphomania due to ovarian trouble. The cure is the removal of the ovaries which is the operation referred to. The cost of such an operation ranges in the neighborhood of \$20.00.]

IMMATURE CORN SILAGE.

[Written for Pacific Rural Press.]

While he has not been successful in raising corn past the milk stage, on account of the cool climate, John Belloni of Fortuna, Humboldt county, has found his two silos a paying investment on his grade Jersey dairy.

This is due to the fact that the silage, while washy and not having the same value as silage from more mature corn, supplies a succulent feed during the winter months, when pasture is not available on account of the long rainy season. By feeding hay with the silage Mr. Belloni is able to supply milk to local customers the year round; and this would be far more difficult and expensive without the silos.

HEIFER TWINS BREED.

To the Editor: My cow gave birth to twin heifer calves. Do such calves ever make good milk cows?—A. H. H., Ukiah.

[Answered by C. E. Beck, Durham.]

[I was raised on a ranch. Father had a cow that gave birth to twins every time except one; some were twin heifers, and some one heifer and one bull. She never had a heifer calf but what would breed and made a good cow. I am 47 years old and have never seen a twin heifer but what would breed if she had the proper show.]

[This must of course be considered in connection with the long accepted belief that a heifer twinned with a bull (a free-martin) is generally sterile.—Eds.]

Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Klondyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915. Write or call and see the herd.

Farm Poultry for Profit.

HOT WEATHER NOTES.

(Written for Pacific Rural Press by Susan Swaygood, Pomona.)

The seasons come and go. This is the vacation season with a capital letter, you notice, but the poultry scribe never gets a vacation with even a little. Reason: everybody and his aunt have poultry troubles along about vacation time, so ye scribe has to keep the think tank going whether it is comfortable or not.

Turkey Troubles Scarce.—There are less turkey troubles heard from this year than usual. Whether this is because of the short crop being raised or because importation of outside stock was prohibited by the State, I do not know, but this I do know, that two-thirds of the turkey troubles are due to over-feeding and the other third is due to wrong feeding and lice. Naturally, the turkey is a healthy bird, used to foraging for what it eats; and to have a big breakfast given to it before it has an opportunity to get any exercise causes all sorts of trouble in the digestive tract. If young turks were allowed to rustle a great portion of what they eat, the loss would be very small from disease of any kind.

For those who are trying to hatch a batch of late turkeys perhaps a few suggestions will be helpful. If you have hatched the early broods and put them with chicken hens, let the turkey hen take the last hatches; not that she is any better mother,

but because the eggs she will lay from now on will not be of much value to you and by letting her hatch and raise a batch of turks she will get into good condition. If she is to be marketed, the flesh will cost little or nothing. But be sure that she is well dusted with a good lice powder several times during incubation and again when the hatch comes off; then she may be very easily kept clean, and her poults will not be bothered until they are old enough to stand them.

Little turks require more animal food than do chicks. This can be supplied by feeding hard-boiled eggs and clabbered milk. One way of overcoming a scarcity of insect life is to have a fly catcher made and cantaloupe or watermelon; then when the poults are home for the night open the fly trap, first wetting the flies so that they can't fly, and bait it with a piece of musk melon, the poults will get a good feast of natural animal food.

The first great preventive of disease among poults is range; let them go and rustle; if they do not rustle enough, make it up by a good feed at night, and let that feed be as near the natural food as possible. The first two weeks, it is best to feed a little every two hours, but always chop up some kind of green feed and keep chick food away.

Feeding Laying Hens.—Around this section we learn that numbers of hens are commencing to molt, feathers are dropping fast; and this in July is a little unusual. When a flock is found to be so far in the molt, it is best to keep the feeding up to the average and give extra grit and mineral so as to help the system to prepare for the business of making new feathers. This is really what robs the hen of her nice red comb, making her pale and bloodless. Feathers are composed mostly of mineral substance; and the more mineral the hens can eat and digest the easier it will be on her. Some grit contains a very good percentage of mineral that is available to the hen; while in other kinds, what mineral value there is in it seems to be locked up and held there unavailable to the hen.

Dealers who take an interest in these matters should investigate, before purchasing, the available min-

eral in the grit they buy. The poultryman has to buy what is for sale in his community; but dealers can and should get that which is best.

Plenty of juicy green feed not only holds in easy reach the very best form of mineral for molting hens, but it also furnishes a vital force that abstracts the good out of all other food furnished. It's the man on the farm that can produce the most healthy chickens and eggs that come to market, because he has the room. These little chicken ranches where intensified poultry keeping is carried on can never compete with the man on several acres of land when it comes to quality.

See that everything under your care is provided with shade, good clean water and necessary food to last through the extreme heat of the day. The hours of inactivity are good for growth in young stock and for repairing the wear on the system in the laying flock. Laying stock need rest during these hot days and should not be unnecessarily disturbed. If they have been fed and are within reach of water, rest is just what they need, but it is a good idea to spray those places where the flock mostly congregates, at least once a week. In places where they have summer showers, this is not necessary because the rain washes the ground and cleans it of both odor and filth. Here we have to rake up and spray to keep the ground in fair condition. When these things are neglected and the flock goes to the same old camping ground day after day for a siesta, the filth and odor accumulate until some epidemic breaks out that proves a scourge to every poultryman within reach.

POULTRY TENANT TERMS.

To the Editor: How fair are these terms for a rented poultry farm: Tenant to furnish and take care of all fowls. Landlord furnish land and buildings, pay for feed, and pay tenant \$35 per month. Products to be divided equally?—S. V. S., San Francisco.

(Answered by Geo. H. Croley of Federated Poultry Association of California.)

[Tentative partnerships, more or less similar to this, are frequently entered. If the poultryman in question has only ordinary ability and capacity to profitably produce fowls and eggs and furnishes stock of only fair quality, the terms are probably in his favor; on the other hand, it could be extremely favorable for the lady should the poultryman have a good-sized flock of high grade, and should prove to have more than ordinary ability to market as well as produce fowls and eggs.

It always requires a very careful examination and the weighing of all factors entering into such transactions to determine the proper division of net profits.]

TOMATOES FOR POULTRY.

To the Editor: Is it safe to feed ripe tomatoes to growing turks and chicks? Is there danger of feeding too many?—P. S. J., Bonsall.

(Answered by Susan Swaygood.)

[There is no danger if the turks and chicks are fed sufficient dry grain and other feed to offset the acid conditions. If they are just allowed to help themselves to either

dry feed or tomatoes they will adjust matters all right; it's only when they are obliged to eat that or nothing that harm comes. However, when chicks or young turks eat tomatoes or fruit the nostrils get clogged up. Go over them once in awhile after they have gone to bed and wipe the beak with a cloth damp with coal oil. You can wipe a dozen off in ten minutes even if you have to catch them.]

CEDAR-LEAF NESTS.

To the Editor: If poultrymen will use in nests the straw or leaves from cedar, instead of old grass or grain straw, there will be no lice or mites. I put green leaves in the bottom of nests and some dry on top, and have never seen a bug around the ranch. This makes the most comfortable nest for the hen—soft and well ventilated.

Pine Grove, Harrison Mitchell.

A poultry keeper of Tulare recently reported that one of his Black Minorca hens, which he has named "Macduff," laid an egg which measured in circumference $6\frac{1}{2}$ inches one way by $8\frac{1}{2}$ inches the other. Now comes a neighboring breeder at Terra Bella who claims that one of his White Minorca hens, that he has named "White Hope," has laid an egg 7 inches by $8\frac{1}{2}$ inches. We have seen some large eggs in our time, but before making any further comments we would like to see these eggs also.

The newly organized San Francisco Bay district milk producers have advanced the price of their milk one cent per gallon.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

NO BABY CHICKS DURING JULY.—Fall hatching starts in August. Get in touch with us immediately, and assure chicks when you want them. Ask for special "Fall Chick" circular. White and Brown Leghorns, Banded Rocks, R. I. Reds, and Black Minorcas. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

BARRER PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Volden, Box 908, Los Gatos, Cal.

MAKE AN EARLY START with your Fall chicks and get them right now. We have Baby chicks as well as chicks one and two weeks old with price same as baby chicks. No weak ones. All strong chicks—all varieties. Santa Clara Valley Hatchery, San Jose, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

DAY-OLD CHICKS.—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

BABY CHICKS.—Strong and healthy, from high-bred free-range White Leghorn stock. Prices on application. Western Hatchery, W. S. Waldorf, Petaluma.

PULLETS FOR SALE.—White Leghorns, Rhode Island Reds, 3 months old. Good stock. Reasonable. Mrs. R. D. Kellogg, Richfield, Cal.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks. Choice cockerels. Fairmead Poultry Farm, Fairmead, Cal.

Runnymede

CHARLES WEEKS
POULTRY COLONY,
PALO ALTO,
California.

First, feed yourself from the products of your "little land," then specialize on poultry for cash income. This I have done successfully for years, am doing now, and advise you to do. Visit me at Palo Alto and I WILL CONVINCE YOU that I know how to keep 1,000 hens on an acre, make them earn \$2 each per year, and still have room for home, garden, fruit and berries. It is the IDEAL LIFE and my new colony, RUNNYMEDE, close to my own home, the IDEAL PLACE for soil, water supply, climate and social advantages. Besides I agree to TEACH you and also MARKET YOUR PRODUCTS. Illustrated literature now ready. No salesmen. If interested, come or write.

CHARLES WEEKS,
Palo Alto, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

I had the pleasant experience last week of being shown the wardrobe of a young lady who was going away to school and I was so charmed with the daintiness and simplicity of it that I want to tell you about it.

This wardrobe was for fall and winter use, so aside from a ready-made silk suit she owned, there was no provision for summer clothes.

A simple little pongee suit made in a belted style and gored skirt trimmed with the new stitch in white, I told you about a few weeks ago, and to be worn with a white silk blouse with deep hemstitched sailor collar was expected to be of much service for school wear. This had a white leather belt, and with white shoes made a very harmonious costume.

An attractive white garbardine skirt was made with a yoke, with two large pearl buttons on each side and a circular piece set on. This also had three rows of the new stitching around the bottom about six inches apart. For a wrap with this, she had a rose jersey cloth sweater, made with a large collar and cuffs of the same material with a white band on the edge. A soft belt that tied in front and large white bone buttons completed a most attractive garment.

For afternoon wear, she had a rose-colored flowered silk, made with fitted waist, square neck and tight sleeves, finished by a flaring circular ruffle. The skirt was made very full, with a pannier, effect at the sides that lifted it a little and finished at the bottom with a heavy cord. The skirt was shirred on to the waist and was to be worn without a girdle.

There were two evening dresses, one being of pale green made in a pointed tunic over an underskirt of lace ruffles with an underwaist of net and full, puffy sleeves with the silk coming up to the shoulder in a graceful line. This tunic was stitched in the same fancy stitch in three different colors, pink, blue and green, and the girdle was of ribbon of the same shades, sewed together and ending in a rosette at the back.

The other evening dress was a two-tone, pale blue Faille silk—it was to be the "really party" dress, so was made a wee bit lower in the neck and sleeveless except for a frill of lace.

The skirt was very full, trimmed with pink ruffles that curved up on to it, each ruffle ending in a rose made of silk. The waist was almost surplice in effect and the neck was outlined in a gold lace that also formed the sleeve.

All of these garments would be suitable for any girl who was to be away from home or at home for that matter, but the girls at school are very busy and have no time to make clothes during the term, so of necessity must have their wardrobes in better condition. Yours devotedly,
Rosabella Best.

The very newest lamp shades, made of silk, have bead fringe.

INDIA CURRY, RICE BORDER.

Wipe slice of veal, weighing one and one-half pounds and cook in frying-pan without butter, quickly searing one side, then the other. Cut in one and one-half inch pieces. Fry two sliced onions in butter until brown, remove onions and add to butter, meat and one-half tablespoon curry powder, salt and cover with boiling water. Cook slowly until meat is tender. Thicken with flour and add one teaspoon vinegar. Serve on platter, surrounded by boiled rice.

BEEFSTEAK PUDDINGS.

[In answer to the request, printed a few weeks ago, from a lady at Alameda, the following has been received from Los Angeles, and while the matter is a little long it is too valuable to give only to one person. We believe several hundred women of California will read the recipes with interest, and we wish to thank the writer for her helpfulness.—Editor.]

I have written out one recipe for steak and kidney pudding which I have always considered good, but have usually made it in one deep basin. There can be no reason, however, why it should not be either steamed or baked and made in individual dishes. In this case, however, I would certainly cook the meat first, using for the purpose a casserole. (Those useful dishes have such good fitting covers, all the juice and steam is kept in and excellent results follow.) If steamed it is not necessary to tie up in cloth. If your casseroles have no covers turn a small saucer or plate upside down over the top of crust to keep steam from crust.

If baked, and I think this is probably what you are referring to, make a good rich short biscuit crust, put meat mixture into whatever dish you wish to use, cover with crust and bake. A bottom crust or not as pre-

ferred. The drawback to small puddings is, the gravy does not seem to be as rich and plentiful as we English people like it. This however could be overcome by careful watchfulness while the pudding is baking by adding a little as it evaporates through the crust (cut a hole in it) and serving additional in a separate dish.

If I have misunderstood your request and sent you something you did not want, write me direct and I will write you again.

In addition to the one I thought you wanted I am enclosing two others, slightly different. The one with potato crust sounds rather as if you had robbed the garbage pail, but it is a nice supper dish in cold weather when served very hot. This is altogether too lengthy for such an important paper as the Pacific Rural Press so I am asking the editor to send it you direct. Cordially yours,

(Mrs.) A. Stanton.

Box 1048, Los Angeles.

Beefsteak and Kidney Pudding.

Ingredients.—2 lbs. steak, 2 kidneys, seasoning to taste of salt and black pepper; suet crust made with milk in the proportion of 6 ounces suet to each pound of flour.

Mode.—Procure some tender steak and divide it into pieces about an inch square, and cut each kidney into eight pieces. Line the pudding

dish, which should be quite deep, with crust made in the above proportion with suet and flour, leaving a small piece to overlap the edge. Then cover the bottom with a small portion of the steak and a few pieces of kidney; season with salt and pepper and a little flour or cornstarch to thicken the gravy, then add another layer of steak, kidney and seasoning. Proceed in this manner till the dish is full, when pour in sufficient good stock to come within two inches of the top of dish. Moisten the edges of the crust, cover the pudding over, press the two crusts together that the gravy may not escape, and turn over the overhanging paste. Wring out a cloth in hot water, flour it and tie up the pudding. Put it into boiling water and let it boil for at least four hours. Replenish water with more boiling, so that the pudding is kept at the same temperature as nearly as possible during the entire time of cooking. If, when the cloth is removed, a small round piece is cut from the top of the crust it will be quite possible to turn it out into the dish for serving without the pudding bursting.

Note.—This is a large pudding and enough for 10 very hungry "boys" after "hubby" has had a generous share.

Personally I think it tastes better if made in one large dish, but steak may be stewed first and then made into as many small puddings as required to feed one apiece, cooked in a steamer, using a casserole dish just enough for one, and instead of turning it out, serve in the casserole, and at serving time remove the top crust and substitute the individual favorite relish. Say a slice of tomato and a spoonful of dressing, or a couple of stoned olives with cavity filled with the favorite dressing or asparagus tips, a touch of mushrooms, an oyster, in fact anything to give variety and the little touch of individualism. If however the crust is really liked and wanted, it could be served on a small separate dish with a generous spoonful of—again the favorite relish or sauce either sweet, savory, or piquant, or even covered with creamed oysters, etc. The ways of varying the same things are legion.

I am supposing the pudding is for home and not for sale nor a restaurant.

If you want to bake them in individual dishes, the casserole again would be nice. Use a bottom crust or not—if served in the dish it is baked in I would suggest about 1/4 to 1 inch strip of crust around the sides to join to the top crust and keep in the gravy. Fill with steak, etc., previously stewed, put on top crust, and bake.

The crust for baked puddings or pies would of course be a good rich, short biscuit crust. There would be some gravy or sauce left over in the casserole where the steak had been stewed. This could be served hot in separate dish if wanted.

Mirrors of any shape or size are being much used—they are all framed in gilt, some simple and others more elaborate in design.

Put yourself
in HER place
Mr. Man

Why not get a good oil stove so that during the hot weather your wife or mother or sister or daughter, can prepare the meals in a cool, comfortable kitchen?

There's no overheating the kitchen with an up-to-date oil cook stove. It's just like cooking with city gas. The burners concentrate the heat at the different cooking points.

NEW PERFECTION OIL COOK-STOVE

For Best Results Use Pearl Oil

No wood or coal or ashes to lug. No waiting for fires to catch up. The long blue chimneys do away with all smoke and smell. In 1, 2, 3, and 4-burner sizes, with or without ovens. Also cabinet models with fireless cooking oven.

STANDARD OIL COMPANY
(California)

MY FRIEND. By Blaine C. Bigler.

My dog and I are the best of friends,
We always go together;
Over the hill where the woodland
ends,
Scrambling through brush and
heather;
Down by the mill where the river
bends,
Through any kind of weather.
Down through the woods through
the purple haze;
Down where the leaves are falling;
Through all the gold of the autumn
days
Filled with the west wind's call-
ing;
Skipping along by the streamlet's
maze,
Where the waterfall comes brawling.
Crossing the fields in the twilight's
glow,
Where soft the wind comes creep-
ing;
Where e'er I lead he's sure to go,
From morn till the stars come
peeping;
So that is the reason I love him so—
He's faithful, awake or sleeping.

HOW THE BEAN BROTHERS WOKE UP.

"Here are five little Bean Brothers for you," said mother one morning, dropping something into Boykin's hand. "They have been in bathing all night long."

"With their clothes on too," exclaimed Boykin; "their little white coats are all wrinkled."

"You'd better put them to bed right away," suggested mother. "Here's a flower-pot on the sunny window-sill. The fresh soft earth will make a fine bed for the Bean Brothers. And if they have a good nap, who knows what will happen?"

So Boykin put them to bed in the soft, brown earth and covered them

up snugly. Day after day the Bean Brothers slept soundly and showed not a single sign of waking up. Then one morning one Bean Brother poked up a tiny bit of slim green back, out from under the bedclothes, but his head he kept safely underneath.

"Come, get up, you sleepyhead," cried Boykin, and, taking hold of Bean Brother's back, he pulled him straight out of bed.

"Oh, see," he called to mother, "Bean Brother has a leg, too, a long spindly one."

"Better put him back again, if you can, and let the others sleep a little longer. It's not time for them to be up yet," mother told him.

Next day the other Bean Brothers had poked up their little bent backs too, but Boykin only watched them and sprinkled their bed with fresh water. Day by day the Bean Brothers pushed up their backs higher.

"A funny way to get out of bed," declared Boykin; "they hump themselves up like green caterpillars."

Then one day the strongest of the Bean Brothers ventured to pull himself away from the warm bedclothes, but he could not stand up straight, and drooped his head sleepily.

"Oh, see, mother," cried Boykin, "Bean Brother has grown out of his old coat and split it in two."

"True enough, what Boykin had called Bean Brother's coat before he had tucked him into bed was hanging in two pieces to his side.

Pretty soon the other Bean Brothers pulled themselves out from under the bedclothes. Then little by little they all straightened up and lifted their green plummy heads. The old coats clinging to their sides shrank and shrivelled and finally dropped off altogether.

Boykin picked up two of the wrinkled bits.

"His coat is all worn out," said he.

"He won't need it again," mother explained. "But it was a good coat in its day and a wonderful one too, for it not only kept Bean Brother warm when he was a tiny baby, but it gave him food so that he could grow into this nice tall Bean plant."

"And will he always live in this flower-pot?" asked Boykin.

"No," answered mother; "when he is stronger we will take him and his four brothers out of this bed and put them in a corner of our big garden, where you can watch them."—Rebecca Deming Moore, in Mothers' Magazine.

CAMPING OUT OUTFITS.

Encourage the small boy to camp out, even if only one night and then very near home, by providing him with a sleeping bag and a few utensils to cook and eat with. The sleeping bag need not be anything but a pair of dark blankets, folded over and sewed across the end and side, one end being left open for him to crawl in. If he is susceptible to cold and you want a more luxurious article, use one pair of blankets and an eiderdown comfort and after folding them over, cover with denim. This makes a very tidy looking bag that will not catch the dust and is very light to carry.

A folding frying-pan and a small pail and tin cup are necessities and one of the knife and fork sets would

The Refreshing Charm of good tea is in its delicate flavor

Unfortunately, the world is not full of good tea. You must choose with care. Those many women who use Schilling's Best know that the cost of good tea is very, very little. But this is not the only reason for their preference. Another reason—a very real reason—is that each of the four taste-types (Japan, English Breakfast, Ceylon, Oolong) brews tea of indescribable charm.

Send for the Taste Packet

which makes it easy for you to find the type of tea that you like best. Contains four parchment envelopes of Schilling's Tea—Japan, English Breakfast, Ceylon and Oolong. Enough for five or six cups of each kind. Mailed promptly on receipt of 10 cents (stamps or coin). Address: A Schilling & Company, 333 Second St., San Francisco.

Schilling's Best

Sold through grocers only.
In standard packages, 8-oz. and 1-lb.

delight him. These sets consist of a glass, into which fits a folding knife, fork and spoon, all of it being encased in a neat leather case. If a lunch is being carried, a knapsack is a convenience, but if not, have the canned supplies rolled up in the blanket and tie well with heavy cord or rope, fastening the ends together and carry over the shoulder.

Use Frenchgloss

In your starch to obtain a perfect laundry finish. It makes ironing a pleasure. Clothes wear longer. Used for SOFT GARMENTS. It gives a silky appearance. Keeps dirt from working into the fabric. Try it. Price 10 cts. at Grocers.

GETTING RID OF ANTS.

Food supplies that are attractive to ants must be kept in glass or tin receptacles if a house is troubled with this pest.

A poisonous syrup made of one pound of sugar dissolved in a quart of water, to which 125 grains of arsenate of soda has been added, will be found to be effective in most cases. This liquid should be boiled and then cooled and strained and is then use to moisten sponges that are placed where they can be easily reached by ants. As this is poisonous to human beings as well as ants, it must be used carefully.

The best and safest way is to place small sponges in tin cans that have small openings at the sides but are covered tightly. This liquid can be poured in until the sponge is saturated and then the cover put on and the can placed in the path of the ants.

Old baking powder cans would be fine for the purpose and there should be several of them.

It is not advised to put these in the house but out-of-doors; as the theory is that if the ants are destroyed out of doors, there will be none to come in.

Of course, if the nests of the ants can be located, the colonies can be destroyed by either kerosene or gasoline, but as these substances are inflammable, care must be taken against the danger of fire.

HELPS FOR THE KITCHEN.

A large tray to carry dishes to and from the dining table is a great step saver and it is equally valuable to use in putting dishes away after washing.

A zinc-covered table is a most desirable thing in a kitchen. A zinc cover can be put on an ordinary table for about \$2 and the saving of work in scrubbing is considerable, besides the advantage of being able to place hot kettles there.

Have the kitchen table and stove at the right height for convenient work. It is back breaking for a woman to stoop over her work.

Use small paint brush to grease bread pans and cake tins.

A convenient arrangement to have over a cooking table is a shelf, with the utensils most used hanging underneath and condiments, salt and other materials placed upon it.

By all means, have a pair of kitchen shears. Use them for shredding lettuce, cutting figs and raisins, preparing grape fruit and the like.

Much time can be saved in cooking by having a goodly supply of handy devices, such as a meat grinder, cream whip, a good egg beater and standard measuring cups and spoons.

FASHION NOTES.

The slip-on sweater with open neck and sailor collar is one of the newest sweater designs, but it is becoming only to young girls and slender women.

Rabbit fur is very much in vogue again, for dress trimmings as well as neck pieces.

The very newest bracelet is of black ribbon with monogram or initial in brilliants.

The Wheat Yield Tells the Story

160 ACRE FARMS IN WESTERN CANADA FREE

of Western Canada's Rapid Progress

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th, upwards of four and a quarter million bushels being exported in less than six weeks, and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common. Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc. There is no war tax on land and no conscription. Write for illustrated pamphlet, reduced railroad rates and other information to Supt. of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Gov't's Agt., Canadian Bldg., Exhibition Grounds, S. Diego, Cal. Canadian Government Agent.

SEE THE STUDEBAKER DEALER

San Francisco, Aug. 2, 1916.

Wheat.

Export trade limited, but Eastern market has been going up for the past week, and has brought many Eastern inquiries into the northern market, causing some advance in club and bluestem varieties in both northern and local markets. Chicago wheat market jumped up 6 cents per bushel today but this is not yet much felt locally.

[f. o. b. San Francisco.]

Sonora wheat\$1.77½ @1.80
Northern club 1.77½ @1.80
Calif. club, cti. 1.75 @1.80
Northern Bluestem. 1.87½ @1.90
Northern Red 1.82½ @1.92½

Barley.

The future market continues very strong, with active trading in December grain, and the firmness is reflected in spot values, though current demands are not especially heavy. Choice bright feed is a little higher. Little is reported sold in nearby districts, and growers are taking rather a firm view, which seems to be justified by conditions. Some 70,000 tons of new barley had been exported up to Aug. 1. New crop estimated between 450,000 and 475,000 tons of bright plump grain. This is 75,000 to 100,000 tons shorter crop than last year, and the movement is much freer than at this season last year.

[f. o. b. San Francisco.]

Shipping, cti.\$1.50 @1.52½
Choice feed, cti. 1.45 @1.50

Oats.

Values show no further change, though seed grades are very firmly held and find a gradually increasing demand. Feed oats also are firm, and are moving freely.

[f. o. b. San Francisco.]

Red feed\$1.65 @1.75
Red seed 1.80 @1.90
White 1.62½ @1.65
Black seed 2.50 @3.00

Corn.

Eastern crop conditions have been bad, causing a further advance in Eastern and local yellow grades. The advance is reflected in higher prices for Egyptian and Milo, which are getting rather scarce.

[f. o. b. San Francisco.]

Eastern Yellow, cti. ..\$1.95 @1.97½
Milo Maize 1.55 @1.65
Egyptian 1.70 @1.75

Beans.

It has been impossible to make many sales at the extreme prices that have been quoted for the last few weeks, the demand having fallen off greatly. While supplies are now lighter than usual in the country, there is still considerable stock scattered among the trade, which the holders are getting anxious to dispose of. Accordingly there is an easier feeling in the market, and several grades are lower this week, notably large white, pink, cranberry, and bayo beans. It does not look now as if there would be much recovery; and the appearance of new beans is expected to bring prices down materially.

[On wharf, San Francisco.]

Bayos, per cti.\$5.75 @6.00
Blackeyes 3.50 @3.75
Cranberry beans 5.50 @5.60
Horse beans 3.25 @3.40

Large Whites 8.00 @8.25
Pinks 6.50 @6.60
Limas (south) 6.00 @6.50
Red Kidney 8.00
Mexican Reds 5.50 @5.60
Tepary beans 4.50 @4.75

Seeds.

Seed market still dormant, with little offered, though demand for cover crops will appear within the next month. New alfalfa has not yet appeared, old selling at 21 to 22c per lb. Sweet clover is cleaned up, bur clover selling at 3½c in burs and 12½c threshed; stocks of vetch and field peas are cleaned up, though new stock will soon be in.

Hay.

Arrivals have again dropped off a little, due to shortage of cars. Much

of stock received comes down the rivers. Dealers believe there is a larger movement into country warehouses, which will add to the cost of handling; and stock so held will not be sent in until prices improve. From other reports, however, it would seem that many growers are merely holding their hay back in the belief that general conditions justify an advance, in view of the shortage of both hay and grass. Local demand is limited, and while fancy hay is scarce, offerings of medium grades are sufficient for current needs. So far little buying for this market has been done in the country.

[Carload lots, per ton, San Francisco track.]

Wheat, No. 1\$13.00 @14.50

been coming in of late, and prices have been cut. Cracked corn is higher, following the course of whole grain; and rolled barley is quite firm.

[Wholesale prices, per ton, carload lots, San Francisco.]

Deciduous Fruits.

Supplies liberal, and prices inclined to easiness. Loganberries and raspberries doing a little better, but blackberries and strawberries have both been going lower. Apples show very little change, Astrachans about cleaned up, Crabapples in excessive supply. Bartlett pears have stiffened up sharply, as there is a strong shipping demand and supplies of attractive stock are light. Apricots, practically cleaned up; peaches in excessive supply and prices even lower than last week. Figs steady at the old level, with limited offerings and a good demand. Plums doing fairly well, and show more firmness, with fancy stock up to \$1.50; prunes weak. Nectarines cleaning up and bring an advance. Cantaloupes in even larger supply than before, and with stocks piling up, prices have

Special Deciduous Market Report.

By J. L. Nagle, Sacramento.

August 1.—Practically 85 per cent of the tree fruit shipments from the State are either moving East or have been sold. Plums, except a few straggling varieties in the mountain districts, are all cleaned up, likewise a few late varieties of peaches. Bartlett pears, except in El Dorado county, Placer county and a few other districts, are also cleaned up.

Thompson Seedless and Malaga grapes are now moving in heavy supply from the Southern San Joaquin Valley, prices ruling exceptionally high and the demand very active, with prospects of its continuing so.

A few lots of Tokays have been shipped from the Winters district, but the movement of this latter variety will not begin from the San Joaquin Valley until about Aug. 15.

Competition from Eastern peach districts has not been very keen on account of the inferior quality of the fruit, due to unseasonable rains in Georgia and Arkansas. There are practically no Eastern peaches moving, and will not be for ten days or two weeks. The field is practically open for that period for California.

Reports from New York indicate

that the Chautauqua and Erie Belt expect to produce 4500 to 5000 cars of grapes, which is about 75 per cent of last year's crop—some districts 50 per cent, other districts full crop. This competition will not be very keen, however, as the demand for New York State grapes is increasing with the local grape juice factories. We look for practically a clear field for California grapes of all varieties and anticipate an unusually successful season.

The following prices have ruled for the week:

New York.—Bartlett pears averaged \$2.30; Wickson plums, \$1.53; Diamond, \$1.44; Duke, \$1.57; Giant, \$1.40; German, \$1.48; Kelsey, \$1.56; Hungarian, \$1.55; Tuscan peaches, 95c; Crawford, \$1.02; Elberta, 88c; Malaga grapes, \$2.16; Thompson Seedless, \$1.80.

Chicago.—Bartlett pears, \$2.28; Wickson plums, \$1.54; Giant, \$1.44; Duke, \$1.68; Diamond, \$1.70; Hungarian, \$1.46; Kelsey, \$1.40; Malaga grapes, \$1.31; Elberta peaches, 72c.

[Total shipments to date from California, 6078½ cars; to same date last year, 4284½ cars.]

Special Livestock Market Report.

REPORT.

The livestock market in general is stationary.

Hogs with exception of light hogs are a little stronger.

Lambs are coming in too freely, weakening the market to some extent. This condition will last only a week or so longer as by that time the bulk of the California lambs will have been marketed, and the demand will have to be supplied from the mountains and Nevada. An improvement in the market may therefore be expected.

The wool market is stationary. Merinos are still strong. Crossbreds slightly weaker, while seedy, burry and short wools are decidedly lower. [Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F.]

Dried Fruits.

About the only matter of interest in the dried fruit market at the moment is the expectation of the announcement of new prices by the peach growers' organization. They have already set a minimum price of 4½ cents to growers for dried strawberry and white freestones and clings. The minimum contract price of yellow freestones is 5 cents. Prices to the trade will be made public within a week. The trade seems reluctant to load up with any dried fruit unless it can be done at bargain prices, which this year is out of the question. Packers state that they are affected not only by the embargo on shipments to England, but that shipments to Scandinavian ports, which were large last year, are almost entirely stopped. A few new apples have moved at 6c, which seems to be fairly well established. Apricots have been marked down again, but very little can be bought at these figures; and packers are still holding to their last figures on prunes, the market on which seems to be deadlocked. Black figs are slightly lower, though white and Callmyrna figs are very strong, and growers at Clovis are said to have refused 10c for the latter.

Nuts.

A letter has been received by us from one of the packers dealing in almonds stating that the foreign crop was short, particularly Tarragonas. This caused some careful investigation on our part, and we learned from authentic sources that the Tarragona crop is about normal, but that the Jordan crop is somewhat short, although this latter variety does not affect the California market to any noticeable extent.

The California Almond Growers' Exchange recently announced to its trade that new crop prices would not be determined until some time after September 1st; it being the feeling of the Exchange that by waiting until crop and market conditions were better known that they would be better prepared to name a price fair to both trade and the grower.

We understand there is very little trading by the packers in new crop California almonds at the present time, as everyone seems to be waiting for the Exchange to announce their prices. A few growers, particularly the Guinda Almond Growers' Association, who have a light crop, have sold at prices considered very high, but other growers in the Guinda district have advised that buying at these prices has ceased.

Manager C. Thorpe of the California Walnut Growers Association advises on July 31: "Our present estimate of the walnut crop for the State of California is 12,250 tons. This is a shortage of 2750 tons over last season but still is above the average production of this state for the past five years. Up to this time all growing conditions have been very satisfactory, and barring any unfavorable weather conditions from now until harvest time, the nuts should be of unusually satisfactory size and quality."

"Los Angeles and Ventura counties will produce almost the same size crops as last season, the principal shortages occurring in Santa Barbara and Orange counties, both of which will be 25 per cent or more short of last season."

Groceries.

Canned salmon is very scarce and firm, with talk of an advance on the new pack. Large hams are firm. Some brands of coffee are easier.

Washing soda is weakening. Canned tomatoes and pie apples are firmer. Crackers tend upward. Flour and sugar are steady as before.

Publisher's Department

A Military Necessity.—Patrons of the Rural Press will note the use of a poorer quality of paper this week. The use of news instead of book paper is necessitated by the doubling of the price during the past few months. As a matter of fact, the quality of paper used in this issue costs 50 per cent more than the book paper we have used cost last year, and even at the price, the fact of securing enough paper to meet our needs demands some effort. Rather than raise the subscription price and advertising rate, we chose to use news paper, but hope to resume the use of book as soon as prices recede. The high price of paper is said by paper mills to be caused by their inability to supply the American demand. In addition, extra trade has been forced upon them by South American users who have been cut off by the war from their usual supply from Europe. The government has commenced an investigation of the paper situation to determine whether the prices are fair and the situation can be alleviated. Paper manufacturers say they are kept awake nights trying to meet demands, but certainly they have no need to lose sleep looking for trade or fear of bankruptcy.

Work of a Good Farm Paper.

Permit me to say a few words of gratitude to the Pacific Rural Press. I have read many agricultural, horticultural, and commercial papers and bulletins; but have never spent time more valuably than in reading the Pacific Rural Press. Such interesting subjects appear weekly in your paper that one can never afford to throw aside an issue without first acquiring a full knowledge of its contents. Many people do not consider the value of farm papers nor appreciate the work of our learned professors and others who lead them to preserve their soil by other methods than by merely "turning it over." Although this commercial world of ours is so great, we are enabled to know what people are doing. In no other way can men work together, help each other or deal prosperously than by knowing what other people want or what discoveries they have made than by having a reliable farm paper widely distributed to subscribers. If any one finds some way in which he may improve old methods, let his fellow-men know that they may also make progress. Farmers are the men who are most depended upon by all other people and they should be paid fairly for what they produce: therefore let them stand firmly together, know the real values, unite to promote progress and be respected.

Andrew A. Azevedo, Jr.

Agriculture and Life.—A text-book for Normal Schools and Teachers' Reading Circles, a new book, by Arthur D. Cromwell, M. Ph. In this book the author takes up agriculture in sequence, the home folks gather hay and grain in the fall; as winter comes along the farmer begins to prepare for sheltering plants and animals, then to feed the stock and to plan work for the next season. As spring approaches they become interested in the soil, crop rotations, plowing, etc. All kinds of farm animals and crops are treated of in this 360 page book, which is also handsomely illustrated and bound in cloth. Published by the Lippincott Company of Philadelphia.

Advertising Pays.—I have been advertising in the Pacific Rural Press for two or three years and I get more returns than from all the other advertising I do. I think, of fifty letters received, forty-five of them would mention having seen my ad. in the Pacific Rural Press. I like your paper and feel it a good one to advertise in. W. H. Browning.

Breeder of Big Polands.
Woodland, July 28.

CORRECTION "NEW METHOD FOR CANNING OF VEGETABLES."

To the Editor: In preparing the article under the above title appearing in the issue of the Pacific Rural Press for July 29, the writer made a very serious omission in the formula for the brine for peas. The formula should include 7 ounces of lemon juice per gallon of water to furnish the necessary acid, as follows: Water, 1 gallon; sugar, 4 ounces; salt, 2 ounces; lemon juice, 7 ounces. If the lemon juice is not added the peas must be heated for three hours instead of the one hour recommended where the juice is added.—W. V. Cruess, Berkeley.

Get the Right Kind of Powder for Stumping

"The farmer needs to know that he is getting *quality* in the powder that he is purchasing," says the *Western Farmer*. "If he secures the right kind of powder, the cost of removing stumps is greatly lessened."

The right powders to use for stump blasting are

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

made especially for stump blasting and other work on Pacific Coast farms. "What the farmer should do," says Prof. G. E. Bailey, "is to use an explosive *especially prepared* for his work; one that stands all ordinary shocks of handling and does not easily freeze. He should not use expensive nitroglycerine explosives."

The Giant Farm Powders—Eureka Stumping for dry work and Giant Stumping for wet work—meet these requirements. They save work in land clearing because they lift and heave over a wide area, and get out roots and all. They save money because they go further than dynamites that merely shatter. Write us if your dealer cannot supply you with the genuine.

Five Books Free

Mail the Coupon

We issue five illustrated books, every one of them worth dollars to farmers who have stumps or boulders to remove, trees to plant, ditches to make, or fields to subsoil. Mark in the coupon the subjects that interest you and the books will be sent *free*.

A Whale of a Pump

Layne &
Bowler
Pump

Designed for
Heavy
Duty

Here is illustrated the most remarkable pump used in California. The illustration is sketched from an actual photo of the Layne & Bowler heavy duty, oil-balanced pump installed at Glendora, Cal. It is one of the deepest installed turbine centrifugal pumps in the world. The lift is approximately 400 feet.

This type of pump is designed for lifts of from 200 to 1500 feet, and the weight of the shafting is suspended upon a thin film of oil which forms a perfect bearing. We manufacture other types and sizes to suit various requirements.

Write at once for our new beautifully illustrated Catalog, No. 25. It gives full details.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows International Hay Presses as they are, and gives complete specifications. Write for it.

Plant Orchard Cover Crops Soon.

Early September is the Best Time to Sow Orchard Cover Crops Where Water is Available. Legumes are Better than Grains, Because They Add Great Quantities of Nitrogen to the Soil from the Air.

[Written for Pacific Rural Press.]

ORCHARD cover crops are legumes, grains, grasses, etc., grown among fruit trees to add to the fertility of the soil, to improve its mechanical and bacterial condition, to shade the ground in summer and prevent heat and drouth from killing the bacteria which make plant food available, and to prevent washing of the soil in winter.

There are some dangers in use of cover crops. If there is not water or plant food enough for them and the trees while both are growing or

baker of Tehama county who has used alfalfa 10 years, C. H. Schmidt of Fresno county who plants it in strips, H. L. Letcher of Tulare county who plants it solid, F. R. Shafter of Santa Clara county who has used it five or six years, and D. C. Lefferts and J. K. Lyon of San Bernardino county who mulch with alfalfa hay. We have noticed orchards and parts of orchards in which alfalfa had unmistakably damaged the trees by usurping the insufficient moisture.

White sweet clover is the only biennial, its virtue lying in its very deep subsoiling root system, as well as the other advantages of legumes. About two tons of seed were sown in the Redlands-Highlands district in the spring of 1915. Wm. Bristol of Highlands, who has grown cover crops on one place 20 years, approves white sweet clover where there is enough summer irrigation. It makes greater stalks than any other. J. W. Casada of the same county has grown this cover crop five years. F. P. Stratton of Tehama county is another booster. He says he has seen sweet clover roots 18 inches deep in one season. W. M. Mertz of Riverside

MELILOTUS PLANT.

Young Melilotus Planted in the Black and White Grove, Lindsay, late October, 1915, and Photographed January 10, 1916. The Root is Shown in the Right Hand Picture, Half Its Actual Size. Where Planted Thickly, the Melilotus Grows More Upright than the Picture Shows.

ROOTS.

fruiting, the trees suffer. If they are left growing too late in spring where there is no irrigation, they dry the ground so it can scarcely be cultivated, and injure the trees correspondingly.

Our summer cultivation of a repeatedly sun-dried and heated soil has a great tendency to remove the upper few inches of soil from all advantage to the trees.

Both legumes and non-legumes are grown for cover crops. The former add to fertility. The latter do not, but may make it more available; and they also add humus and make hard soils friable.

Deciduous Cover Crops Popular.—Most of the cover crop acreage is among the citrus orchards of Southern California. The past two years have seen a wonderful increase of cover crops in deciduous orchards of Upper California.

Three seasonal classes of cover crops are grown quite largely all over the State: winter, summer, and perennial.

Alfalfa is about the only perennial. Instances of this are F. H. Bru-

Experiment Station notes that it is remarkably free from insect pests.

Annuals.—The principal annual cover crops grown in California are vetches, Melilotus indica, bur clover, grains, Canada field peas, fenugreek, alfalfa, beans and weeds.

Oregon, German, or common vetch is the commonest variety, with hairy vetch, purple vetch, and black bitter vetch in much less quantities. All varieties are badly subject to aphids, though purple vetch seems not to be attacked until it has made great growth. It makes the greatest tonnage of all winter-growing cover crops, but seed is unavailable. It is a great deal grown in Oregon; and many Southern Cal. growers used it in the season of 1914-15. The Limoneira ranch had 300 acres of orchard in purple vetch that season and endorsed it highly. The Hardison Ranch Co., also of Ventura county, found black bitter vetch did not make satisfactory growth. Common Ore. vetch was very buggy and partly smothered where planted 40 lbs. per acre with an equal amount of barley. Rye did

EDITORIALS

THE WEEK.

EVERYTHING indicates that our California fruit industries will take an unprecedented and generally unexpected stride forward as the result of this year's experience. We say "unexpected," because we surely had a winter of discontent, through apprehensions born of embargoes, alleged ship-famines and buyers' pessimism—all of which have been evolved into most glorious summer by the force of free buying, made possible by widespread prosperity in the consuming regions of this country. In this way the current trade may be looked upon as unexpected in volumes and values of transactions, and yet this summer's experience is just what might have been most rationally expected on the threefold basis of the truer and wider appreciation of the delight and desirability of fruit-foods, the wide prevalence of ability to purchase them by a nation of such vast and rapid development as the United States, and the natural and industrial capacity to produce fruit foods which California proudly possesses. It is, of course, impossible to measure the new greatness of the present year, because we are now but on the threshold of its chief transactions in late season movement of fresh fruits, and have the operation in canned and cured fruits still largely before us, with rolling up vast volumes of supplies still in progress. But one can get a hint of the way things are going from a study of current prices as they appear in our market columns. There is also a pertinent suggestion in the remarks credited to C. B. Mills, president of the Pioneer Fruit Company, as follows:

"The situation is unprecedented; The East is crying for fruit and we are not able to supply them with more than 75 per cent of what they want. Orders are piling in here so fast that we are forced to turn them down every hour. The other shippers are in the same position."

Preliminary figures are also significant. Up to the first of August the eastward movement of fresh deciduous fruits is fifty per cent greater than last year—and last year was the greatest ever. Of citrus fruits, last year's shipments were 46,000 cars; this year's, thus far, 40,500, with three months' work ahead. It looks now as though the year's shipment of fruits and fruit products from California would aggregate 200,000 10-ton carloads—more than twice as many as a decade ago.

STANDARDIZATION AND PUBLICITY.

LEST anyone may claim that this year's experience is accidental and caused by distant purchasing ability which may not endure, we hasten to say emphatically that the enlarged distant demand is not founded upon this fortunate incident, which merely causes California preparedness to work faster, but otherwise exactly as foreseen and calculated. The fundamental conditions upon which the trade expansion rests are three: the production of plenty of fruits of the kinds fittest for the trade; the wide prevalence of standardization, which gives the consumer the worth of his money; the organization for generous and attractive publicity, which makes the consumers' money burn holes

in their pockets. If these fundamental forces had not been at work, this year's experience would not have been possible to any such extent as is now being realized.

And the lessons from these facts should be diligently heeded. Planting should be continued with varieties well tested and found suitable; not with varieties the claims of which rest upon prophecy. Our products must increase on the basis of canners' preference, of driers' experience and of shippers' results in fresh-selling. The old biblical injunction, "Prove all things; hold fast that which is good," should be inverted in commercial fruit planting—hold fast that which is good; prove all things, which are offered as better, before planting on a commercial scale. Do not dream of getting the start of the community by planting the largest acreage of a new thing. It is apt to make you a grafter instead of an upstanding, confident producer.

One of our associates has given much time and care to writing of the details of standardization, and he will continue in this line. There is wide agreement among those interested that standardization is the most effective advancement agency which has ever been invoked in the development of California fruit production. It is fine to see this policy, which is so sound in theory, working out so well in practice so soon after its adoption. It is not perfect in its details and organization, and should be improved, so far as possible, by the next Legislature. This was the conviction upon which the Visalia Fruit Growers' Convention proceeded last November, and one need not be surprised to see the inquiry-organization, which it created, rise soon into action, phoenix-like, from the ashes of the spite-burning to which the San Bernardino assembly tried to reduce it. It is just the right time to proceed in this direction, for the experience of the current season has yielded new light for revision. The work of the county horticultural commissioners is showing them capable of higher functions in the executive horticulture of the State. They have been sitting as watchdogs for bugs until tails are growing on some of them. It is time for them to arise and assume a most important part in the public marketing machinery of the State, and thus become more effectively promotive of the prosperity of fruit-growers.

As for publicity through publications and demonstrations in consuming regions, does it longer need favoring argument in the face of the results obtained by the citrus growers, the raisin growers and others? Certainly not. The elegant advertisements now appearing in most popular Eastern journals, conveying so artistically the suggestive call of taste and wholesomeness in the selection of most delicious and nutritious foods, are not only multiplying the demands for such foods, but are indirectly deepening the world-conviction that California is the place for those who wish to live well. When all our organized groups of producers get to making such representations, each for its own line of production, California will enter upon a new era of appreciation in all parts of the world.

"TRADE FOLLOWS THE LOAN."

THE high financiers of this country are stirring up their constituencies to a better understanding of the fact that the installation of Uncle Sam as the gold-bug of the world does not mean that he is to be the supreme international miser, but that he will be using his advantage for the upbuilding of vastly increased trade in all American manufactures and productions. The more of this surplus wealth he lends to others the greater will be the demand of the debtors for the lender's goods to grow with in their own development. As the National Bank of Chicago says in its August circular:

More important than the opportunities to trench ourselves commercially in the markets of the world are the opportunities to supply the capital for foreign commercial and industrial developments. If we would profit from the experience of the older nations which have held those markets before us, and incidentally solve the question as to our retention of them after the war, we would adopt no better slogan than that of "Trade follows the loan."

Now we are not expositors of high finance, and therefore have no business with these golden dreams of national financial supremacy, except to say that it often happens that economic policies are just as truly operative toward the same ends in the attitudes of classes and individuals toward each other as they are in the relations of nations. For example, it is true in the same way, but not to the same extent, that when a country banker, or a city banker doing country business, makes a loan to a wise farmer for a wise productive purpose at an interest rate and for a length of time which enable him to wisely come through with his wise scheme of production, said banker not only gets fair pay for his service, but he helps every person in the community to render more service and to get fair reward for it. This is what "rural credit" reforms aim at, and this is what they are doing all over the world—except in the United States and in other half-baked countries, which need to have their attitudes toward country loans turned over and warmed on the other side. All countries, except those which are warm only on one side, have found out that "trade follows the loan," and have experienced the general advantage to all which comes from building up agriculture with favoring fairness to the doers of it. When we get money, at fair rates and terms, throughout the country to improve land and increase its productivity, to enable all who are handling land to get better livestock, better machinery, and to develop the higher intellectual activity which these better agencies engender, the results will be not only better homes, greater comforts and higher citizenship on farms, but, as "trade follows the loan," we shall have greater prosperity for everyone who honestly ministers to the advancement of our fundamental industry.

THE BANKER AND THE PIG.

IN SPITE of our resolute defense of local financiers we are aware that we have some irreverent readers who persist in considering the term "banker" as a synonym for maturity in the pig. This being the case, they will think it quite proper that bankers should assume such paternal attitude toward the pig as the following statement suggests. It is written from Porterville that H. C. Carr, chairman of the committee on agricultural education and development of the California State Bankers' Association, has told a reporter that plans have been worked out by his committee whereby banks that are members of the association will furnish to schoolboys money on their personal notes for the purchase of pure-bred pigs, to be fed in accordance with scientific methods. The First National Bank of Porterville, of which Mr. Carr is vice-president, has announced that a fund has been set aside for this purpose and will be available this fall to the pig-growing boys of his parish.

This is a very commendable thing to do and we hope the thing will be arranged so that neither the boys nor the pigs will lose their skins—for there, again, we seem to be influenced in our language by the prejudices of the irreverent persons aforesaid. In lending money to boys to buy pure-bred pigs, the California bankers are following a good example, for bankers in other States have done it and have found it good banking because it is safe and profitable lending; because it increases the appreciation of good live stock and because it teaches boys how to deal with banks—which is a very useful lesson in progressive farming. We are disposed to approve it, also, because it gives a concrete instance of the every-day applicability of the high-finance principle that "trade

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 8, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	1.31	.12	62	50
Red Bluff	0	1.02	0	102	62
Sacramento	0	.06	0	100	66
San Francisco	0	.03	.03	72	48
San Jose	0	0	0	90	46
Fresno	0	0	0	104	60
Independence	0	0	0	88	56
San Luis Obispo	0	.03	.03	82	44
Los Angeles	0	0	0	82	56
San Diego	0	.02	0	84	62

follows the loan." Every pure-bred-pig boy will open an account with the bank—even if he does begin with a debit entry, which is not so good as the other kind. But when that pig begins to earn something the credit side will begin to grow, and if both boy and pig are "good individuals" their influence will be seen and felt all through the community. Besides all those boys will learn something about bankers and all those bankers will learn something about boys and farming, and the whole neighborhood will take a step toward higher living. For we read that out from the plains of conflict a little child shall lead the vast menagerie of predatory beasts and their former victims, "and they shall not hurt nor destroy in all my holy mountain," saith the Lord.

CALIFORNIA AND RURAL CREDIT.

SINCE our last issue the Senate of the United States has unanimously approved the appointments to membership on the Federal Farm Loan Board of the four persons named and described on page 127 of our issue of last week. This means that all political parties represented in the Senate at the present time agree to follow the lead of the democratic majority which achieved this legislation—which is rather a good showing of good will for a new economic policy. Naturally the next question is when will California be able to get to work at mortgage loans in the United States way? There can be no immediate answer. The Farm Loan Board has to set up all the new machinery which the law provides for its own operation—and much of it has to be made to order, all the way from organization to the minutest regulation and method of procedure. To an outsider it seems likely that this may take several months of careful work. Then the Board has to establish twelve district land banks, organize and capitalize them as the law provides; and it has to be careful to get them in the right place, we presume, for it would be rather bad to locate a district bank in a State where no local business could be done. Only those States are eligible to do business in which—

"the laws relating to the conveying and recording of land titles, and the foreclosure of mortgages or other instruments securing loans, as well as providing homestead and other exemptions and granting the power to waive such exemptions as respects first mortgages, are such as to assure the holder thereof adequate safeguards against loss in the event of default on loans secured by any such mortgages."

Perhaps the "trust deed," by which a Californian can waive everything but the undertaker, would answer this requirement, but some lawyer has to tell the Farm Loan Board about it—and the same thing has to be done for each of the States before the eligibles can be listed and the ineligibles fitted with new laws if the legislatures so desire. It would seem that this might take several months. We state these requirements of preparedness, and there may be many others, simply to advise our readers that the beginning of business under the new law is not likely to be sudden, and undoubtedly the various steps toward the beginning will be duly announced as they are taken by the authorities.

Meantime it is apparent that private corporations are changing their ideas of interest rates and costs at which they are willing to make their idle money useful in agricultural improvement and development, and this is not the least of the advantages which Uncle Sam's friendly interest is bringing about.

Browning Grape Leaves.

To the Editor: I have some grapevines on the south side of the house which I am trying to grow for an arbor. The first of the season I watered them, but for the last three months I have given them very little, so now the leaves are turning brown. Should they have a good soaking occasionally or not?—Amateur, San Jose.

If the leaves have shown grayish powder and disposition to curl earlier in the season they probably had mildew which free dusting with sulphur would have checked. If the leaves were good

earlier in the season and are now browning, first around the edges and then going clear brown, they probably needed water some time ago. Irrigation is usually not needed in your valley early in the season, but for good foliage for arbor purposes you should water freely until the rains come to carry the foliage to the frost date.

A Melon Depredator.

To the Editor: I have a nice patch of Rocky Ford melons and every morning I find some of the leaves and runners eaten off. What is doing the mischief? Sometimes I find a number of small black bugs around the vines. Is it this bug or cut-worms? Have tried sulphuring them but it does no good. What can I use?—C. L., Campbell.

We cannot do much to determine either guilt or innocence without specimens. "Small black bugs" are not apt to "eat things off." They may eat or puncture leaves and cause collapse, but one has to see the particular bug to tell what it usually does. The eating off might be done by some of the cut-worm group. If so you are likely to find the culprit in the loose earth near where the cutting has been done. Sulphur is not a poison to animal life. The fumes of it kill mites like red spider, etc., but it is so poor as an insecticide that one wonders why so many people run for sulphur when they have a general desire to wipe out the animal kingdom. It must be its association with the idea of future punishment. To kill a leaf-eater you need a poison, such as lead arsenate, because that kills insects which bite without injuring foliage. It is now probably so late that a few leaves and runners are not worth fighting for.

Black and Oriental Cockroaches.

To the Editor: Please tell me how to get rid of large black water bugs resembling roaches that infest my house, only coming out at night from the basement. They also look like black beetles. I send specimens.—M. W., Los Angeles.

The insects are cockroaches of the black or oriental species (*blatta*, or *periplaneta*, *orientalis*), which are widely distributed over this continent though native and common in Europe. They are nearly an inch in length when fully grown, quite thin or flat and with very long, thread-like antennae. Your mistaking them for "black beetles" is warranted, for that is one of their common names, but cockroaches are nearer to crickets than to beetles. The insects probably do not come from the basement but from near-by warm places in the cracks behind the carpentry of the kitchen or pantry, or crevices behind boxes, etc., where they like to sleep away the daylight and forage in the dark. If you can putty up all the cracks you can exclude them, but that is a hard undertaking usually for they will take all kinds of hiding places. If your electric bell does not work you may find the bell-case full of them, etc. They are hard to poison with arsenical insecticides because they are too smart to eat them, but you can make a mixture of powdered sweet chocolate (or sugar) and borax and they usually help themselves to it if it is put around where they have been finding your bread, crackers or left-over foods. The borax will slowly knock them out. Of course you will clean out all possible hiding places and kill all you can.

Irrigating Sorghums.

To the Editor: Please tell me the right time to irrigate Egyptian corn. I planted it a little over a month ago after irrigating. It is three feet high now and the cultivator brings up moist dirt. I thought of irrigating just before it heads out, but some people tell me not to irrigate until it heads.—G. F., Esparto.

The time to irrigate any crop is just before it needs it and experience will help you to judge by the looks of the soil how soon that time of need will come. It is not wise to wait until the plant shows signs of distress. If you are growing the plant for a seed crop and it looks thrifty and the soil has plenty of moisture as your cultivator shows, we should wait for the plant to shoot the heads as your neighbors advise you. But this is

not a hard and fast rule because on some soils the plant may have too little moisture to shoot a strong head and must be irrigated before it gets stunted. You must use judgment and not depend upon any rule.

Quick-Fruiting Apricots.

To the Editor: Summer pruning of apricots is advocated in recent issues of the Pacific Rural Press. We have some Royals on Myrobolan in heavy soil near the foothills in Fresno county, now in their second year. They were heavily pruned last winter and are exceptionally large, strong and well shaped. They bore some fruit this year. They are growing between olives which we intend to have for the permanent orchard, so we want to get returns from the apricots as soon as possible and take them out, when the olives bear well. I notice that "California Fruits" advises against summer pruning of apricots the second summer, but under the circumstances we thought it might be advisable. What would you suggest?—D. S. K., Sanger.

The advice against summer pruning of young trees is to promote the chief business of a young tree, viz.: to make vigorous and strong wood growth, and summer pruning acts against that. By repressing wood growth summer pruning promotes fruiting which is not usually desirable in young trees which are expected to occupy the ground for decades, perhaps. You intend to have your apricots enjoy a short and busy life, and what you say of their present aspect indicates that they are ready for it. As they are Royals and therefore free fruiters, if not hit by frost, they would probably serve your purpose well by stopping pruning altogether, but as they have probably sent out branches too long to carry the weight of the fruit which will probably set upon them, such branches should be shortened and the mass of the fruit brought nearer to the center of the tree. Therefore shorten such branches now, but do not cut the laterals and spurs on the frame work of branches which you retain. Keep them for next summer's fruiting. Next winter trim only lightly if at all—thinning out shoots, if there seem to be too many, for this will tend toward increasing size of fruit on the bearing shoots which you retain.

French Grower Wishes White Peaches.

To the Editor: I am growing peaches for the Paris market and need something larger than the "Uruguays" from South America. I need the earliest, largest white-fleshed peaches and think you may have them in California.—R. E. G., Paris.

We do not know the "Uruguay" and cannot make comparisons. The first peach to ripen in California is the "Mayflower," an eastern variety; next a group of varieties including "Briggs May," a California variety; then "Alexander," "Hale's Early"—both Eastern and leaders in amounts grown in California for Eastern shipment. They are all fairly large, when well grown, and very handsome. We have two white freestone peaches ripening later, the "Decker" and "Opulent." They originated in California but are not widely grown here because a mid-season white peach has little commercial chance as compared with a yellow peach. The "Opulent" is a Burbank variety of exceedingly high quality. You should try it for your special purpose.

Walnut Seedlings Too Small.

To the Editor: I am sending a black walnut tree growth from the nut, planted last spring. I am told that these trees would not hold the graft. Will you kindly tell me what I can do with them?—T. M., Concord.

The seedlings are not affected with any disease so far as we can see, but they have not made growth enough to qualify them for a working stock. If you cultivate well and give them water, if needed, you may force growth enough during the next two months to make them large enough to take a graft in the root-crown next winter or you can let them go over for budding a year from now. Where growing conditions, in heat, moisture and soil, are very favorable the seedlings can make large growth the first summer, but under other conditions it is not unusual for them to make too little growth for working the first year.

Birth of Standardization Law.

[Written for Pacific Rural Press by Assemblyman Geo. W. Ashley, who introduced the bill in the Assembly.]

I notice in your issue of July 1 the article entitled "New Fresh Fruit Standardization Law." Believing that it might be interesting to know of some of the difficulties met in the passage of this law; in getting together the different ideas and factions and in securing the votes of many of the members of the Legislature who, not being interested in fruit growing, were against the law on general principles, calling it "regulation run mad," etc.

You will remember that attempts had been made at different times, both by agreement and by the attempted passage of laws, to secure standardization. By agreement this had succeeded in one or two counties, but had been abandoned in the others.

In the fall of 1914 a committee composed of F. B. McKevitt, C. B. Bills, and H. E. Butler, met and drafted a tentative bill. This bill had no system of inspection to carry out its different features. The different fruits were grouped in similar classes in the law. Otherwise the present law is quite similar to the original draft.

When the tentative bill came before the Legislature then the fun began.

Some demanded inspection, and would be satisfied with nothing else. Some wanted this inspection to be by the State, others said that they would fight to the bitter end against State inspection and wanted it by county boards. Some did not want inspection at all. Some wanted 18 per cent sugar, others 16 per cent. Some wanted the bill to read "free from insects and fungus diseases" and "of uniform quality and maturity," in all cases, others wished the word "practically" inserted in each case. Some wished the cantaloupes added. Some wanted it to cover fruit for consumption within the State, others did not. Some wished to pay the inspectors \$5 per day, others \$3.50. Some wished them under Civil Service, others not. Some wished to defeat the bill by making it impractical, others by making it unconstitutional. Some wanted the whole law made stronger. Out of this mass of different ideas and against the opposition of many people and of at least one comparatively large fruit company, the bill was passed in its present form.

To do this took many meetings with many committees, some meetings running into two and three o'clock in the morning. It also took some personal trips to different counties. It also took the personal friendship and trust of many members of the legislature who did not personally understand the necessity for the law, to secure its passage without a vote against it in the Assembly and with only one vote against it in the Senate. Also it took the aid of many men like C. E. Virden, J. L. Nagle, Dr. Cook, Jos. Di Giorgio, F. B. McKevitt, Mr. Madison and many others. Also the aid of R. T. McKisick of the Attorney General's office.

All of us realize that there are a few changes needed in the law, but there are comparatively few. The

general idea in the passage of the law was the protection of the small grower, the building up of the industry, and protecting the fair name of the State.

CAPRIFIGS PRODUCE POLLEN ON ALL CROPS.

[Written for Pacific Rural Press by Francis Hetny, Brawley.]

In commenting on your communication in regard to using *Pseudocaria* fig to pollinate the early (breba) crop of Smyrnas I can state that I have done this as much as 6 or 7 years ago. But unless the mummies are plentiful it will be pretty hard to induce the blastophagas to enter the female breba figs, inasmuch as they prefer to enter and infest the prothichis, which appear to be very plentiful at that time.

There is absolute certainty that all crops of *Pseudocaria capri* figs have pollen stamens; this is true also of their hybrids; but there is another class, the *Ficus afganistanica*, and hybrids, which carries stamens with pollen. The first wasps begin to issue in latter part of Feb. and the last in the early part of Dec. The life cycle is 40-50 days. Somewhat shorter than further north, where apparently, according to Prof. S. P. Rixford, it takes 60 to 75 days from the egg to the adult. It takes 6 weeks or more to mature the female fig after the pollination date.

The season here lasts 5 to 6 weeks. So when the wasps begin to issue in the latter part of Feb. they may last until almost Apr. 15, especially since our new hybrids of *pseudocaria* and *afganistanica* began to produce.

But as the season advances the season prolongates, and the fourth and fifth crops almost run together and this happens in latter part of Aug. After this date wasps are available most any time.

I have harvested fine ripe Smyrnas on Christmas day and some as late as Feb. the next year. This of course during dry, frostless winters.

Although pollination of brebas is possible, it will be necessary to produce hybrids of heavy mummy crops to make this practicable.

WALNUT CODLING MOTH.

[Written for Pacific Rural Press.]

Codling worms do great damage to walnuts in various sections of California. Banding the trees has been recommended, but A. Cock, manager of the San Joaquin Fruit Co. ranch in Orange county, says that won't work, but a torch does. Since so many attempts with torches have caught most everything except codling moth, we do not recommend torches, but present Mr. Cock's observations on the habits of the insect.

Unless the moths are destroyed, they will lay eggs in the newly opened cracks in the hulls, and the worms on hatching will crawl around toward the stem end. There they will bore through and develop inside the nut.

Mr. Cock has found on his own Tustin place, holes bored through walnut shells, and perfectly formed worms inside. He has found one-

half of a nut good enough to eat while the other was webbed up and contained a worm. He has found worms among leaves and trash on the ground as well as under sheltered places high on the limbs after the nuts are off. He believes they hide anywhere they can until time to turn into moths which lay the eggs as mentioned. He has noticed that the hulls usually stick to wormy nuts.

The conclusion is drawn that all cull nuts and trash should be cleaned up as soon as feasible. One way to accomplish this is to turn hogs into the orchard as is done on the Rowland Ranch in Los Angeles county.

PLANT ORCHARD COVER CROPS SOON.

(Continued from first page.)

not compare with barley to plant with vetch.

Bur clover is the most widespread volunteer cover crop legume; and if given any chance, will seed itself. Ed Ames of Placer county plows furrows wider than his plow to leave tufts of bur clover out to seed. C. V. Freed and Gerald Geraldson, of the same county, leave alternate centers growing all summer, changing to the cultivated rows each succeeding season.

H. A. Clark of Santa Clara county has tried bur clover during two widely separated seasons on 15 acres of unirrigated orchard, but figures Oregon vetch is most satisfactory, planted with barley rather than with rye. He points out that it is a waste to sow bur clover seed without the burs where there is no irrigation, but that it will germinate if sown in the bur. It is difficult to buy seed in the bur, however.

The Coming Cover Crop.—*Melilotus indica* has proved by far the best annual winter cover crop in Southern California and is rapidly gaining favor in the central and coast regions of the State. It was introduced due to the Citrus Experiment Station at Riverside under direction of Wm. Mertz. He showed that *melilotus* would make growth nearly equal in tonnage to purple vetch, and Prof. McBeth showed that its above-ground portion runs higher in nitrogen per ton dried than purple vetch or alfalfa and over twice as high as corral manure after all water is taken out of them. According to Mr. Mertz, over 60,000 acres of *Melilotus indica* were planted last season. In a large measure it grew successfully, though many of these plantings were first attempts to grow clover in the orchards. It has grown on a wide variety of soils, is cheaper than vetch for seed, and is the most productive of nitrogen.

A. Neilsen, on one of Judge S. F. Leib's places in Santa Clara Valley, had highly satisfactory results from this *melilotus* last season among ten acres of walnuts. Dr. R. E. Pierce, J. N. Reynolds, and C. A. Beinhorn of Tulare county are some of the successful growers. J. A. Harliss of Santa Clara county broadcast seed without irrigating, but just before a rain, and got a beautiful stand. The plants, however, did not get enough growth to withstand the severe cold. His neighbor, who irrigated earlier in fall and sowed seed as soon as he could cultivate the soil, had *melilotus* which became

waist high, having been protected from frost by volunteer bur clover and weeds.

Canada field peas were popular long ago, but lost favor, largely on account of aphids and high cost of seed per acre. The Sorosis ranch in Santa Clara county is one of their biggest advocates. They had 100 acres of prune orchard planted last season to these field peas, and will plant the same this fall.

Beans of various kinds are being tried out for summer cover crops. Commercial varieties pay, but there is objection to the others on account of high cost of seed. The Citrus Experiment Station is working on a smaller seeded strain of Windsor beans. B. B. Green of Sacramento county has been growing inoculated bayos among his young pear trees.

Grains add practically no plant food to the soil and serve no purpose which is not served by legumes where they do well. Barley, oats, and rye are the winter growers, and a proper combination of grain and legume seems to induce greater growth of both. The Hardison Ranch of Ventura county found that 25 pounds barley with 40 pounds vetch seed did not smother the vetch as when 40 pounds of each were sown. Rye was discouraged. The Sorosis Farm had 150 acres of prunes sowed to vetch and barley and will have the same next year. They pasture or feed it to cows and return manure to the orchard. Fifteen pounds rye in combination with 25 pounds purple vetch seed per acre in 1914-15, grew over six feet tall for Mr. Harliss, "a regular wilderness," which he now proves by excellent photos. Other cover crops are either experimental or incidental.

September Sowing Urgent.—With all of the legumes, early fall sowing must be insisted upon. Probably more failures have been due to sowing after Nov. 1, than to all other causes. Some people sow it dry and hope for rains to bring it up. The most successful growers regulate moisture and sow in September, the sooner the better according to those who have tried it. Seed expense should not enter the calculations of which variety of cover crop to use. The results count.

The seed needs warm moist soil to start. It puts out a very few leaves and seems to stand still all winter. Early or late in February the best of the cover crops start rapid growth and are two to six feet tall before ground is too dry to plow after usual spring rains. The longer it is allowed to grow in spring, the more real humus it will make, the more nitrogen it will put into the soil when turned under, and the more effect it will have in loosening heavy soils. But delayed plowing is disastrous to trees, and to soil for the rest of the season if irrigation or rain are not available.

Inoculation.—Every farmer wants to know whether to inoculate the seed. Dr. Hilgard, one of the foremost American authorities on soils, says, "A great advantage is gained by infecting either seed or soil with a form of bacteria already adapted [to its own leguminous group] when no similar plant has lately occupied the same ground." The bacteria are needed, and will greatly increase stand and growth where supplied in sufficient quantities. This may be

done by sprinkling dirt from fields of the same kind of legume over the field to be planted, or by inoculating the seed or soil with pure cultures of adapted bacteria which are sold in California under the names of Farmogerm, Nitragin, Nitrobac, and Westrobac. Inoculated seed or soil

should not be held long before mixing into the moist soil of the field or orchard so the bacteria may not die before beginning to multiply. Inoculation is seldom necessary for successive seasons after the first year's vigorous growth of a legume, though it often helps run-down stands.

Improved French Prunes.

[Written for Pacific Rural Press.]

The writer had the advantage last week of looking into the behavior of several types of prune d'Agen in the Santa Clara valley in company with Leonard Coates of Morgan Hill, who has for many years given close attention to the effort to secure larger prunes and more prolific trees by selection and propagation of natural variants wherever they can be discovered in bearing orchards. In this way it seems possible to accomplish marked improvement and at the same time retain the distinctive characters in flesh and pit which make the French prune a world-beater in its cured product.

At "Rawdon Dell," Mr. Smith's picturesque fruit farm near Saratoga, we saw fruiting a tree, propagated from a branch of an older tree, which was unfortunately not preserved, bearing a fruit averaging, when cured, about 31 to the pound when the orchard run was 57 to the pound. It departs from the normal shape of the French, having filled out its shoulders and hams, so to speak, so as to present an outline more like a section of a cylinder—an oblong, squarish form. It has in fruit-stem, pit and twig growth, as well as in size of fruit, marks of greater vigor than the common French adjacent to it and though handicapped by too many of its natural enemies, the tree shows much strength of growth and prolificness. Mr. Coates is making careful comparative tests of this variant, both fresh and cured, and it may become notable. It is circumstantially established as a variant appearing on a single branch of a French prune tree, and can be presumably credited to a bud-variation.

At Mr. McKay's place near San Martin, we saw in fruit a fruit having the general form of the French but much larger than the run of the French growing near by. This is particularly interesting because it has been known to Mr. McKay for many years and was also known, it is said, to the late J. F. Flickinger of San Jose and first appeared in his orchards. Mr. McKay is guarding the type carefully, is propagating from it for his own planting and expects to fully establish its superiority. Mr. McKay differs firmly from the condemnation of the cured Standard prune of Burbank recently expressed in these columns. He believes our disfavor of the Standard was due to testing cured Standards made from fruit not fully ripe. We shall see later; we like to be caught in error, when we drift into it unconsciously. Perhaps all growers of Standards may like to test the mat-

ter by picking later. As the Standard does not fall well, it refuses to test its own maturity in regular prune fashion, and the grower must look out for it.

On Mr. Coates' test grounds we saw a seedling which the originator, Mr. Burton of Vacaville, considers about 15 points better than the French. It also has the signs of excess vigor in fruit-stem and twig growth associated with increased size of fruit and these correlations are probably natural and to be expected. Mr. Burton is still working with prunes and is not sure that he has done his best yet.

We were assured by observers that the pear-shaped variant of the French prune, of which Mr. Coates published an account in these columns many years ago, is still in the ring for preferment although specimens were not within reach at the time of our visit. During his last trip abroad Mr. Coates made careful observations in the Agen district and this fact, with his long experience in this state, eminently qualifies him for the special work with the prune which he is now carrying on so energetically.

GRAPES LATER ON OLD VINES.

[Written for Pacific Rural Press.]

Tokay grapes on old vines keep in good shape later in the season than young vines partly because they are higher from the ground and perhaps because of the difference due to age of vines. It is perhaps partly due also to their later ripening.

H. J. Cooper of San Joaquin county says that he used to commence picking from the vines, which are now 23 years old, in August; now he has to wait until the last of September and sometimes holds them on the vines, as he did last year, until the middle of October.

When held on the vines one should be prepared to take the risk of losing them by rain which is likely to come and spoil them for shipment. Mr. Cooper lost the grapes of a large patch of old vines last year because he held them until the middle of October for the sake of better prices. It rained just as he was ready to pick them.

OUR POMOLOGICAL QUALITY.

To the Editor: I have been since 1887 an ardent reader of your sprightly and semi-acid editorials—as the pomologists would doubtless term them. Long may the aroma and flavor linger in the Rural Press, continuing to delight the ever-increasing circle of admirers.

Napa county. Yountvillain.

Codling worms and San Jose scale are occasionally found in and on apples being packed for shipment East. Such are culled out and sold to city hotels, etc.

Death to Dandelions.

How These Persistent Lawn Pests can be Reduced and Perhaps Extirpated, if One Will Do the Work Well.

We have previously mentioned the interesting undertaking at the Colorado Agricultural College to meet the great lawn pest, the dandelion. Later particulars which all lawn-lovers should consider, are communicated by B. O. Longyear of the college to W. S. Clayton, president of the First National bank of San Jose. The letter in part follows:

The Use of Gasoline.—A small amount of gasoline to the cut end of the dandelion roots left in the soil will prevent their sprouting, but of course this means extra work, although it disposes of the plant at once. Where there are only scattering numbers of the dandelions in the lawn, the use of gasoline can be recommended, as one application is sufficient to entirely kill the plants. The easiest way to apply it is by means of an ordinary machine-oil can. A scant teaspoonful squirted into the crown of each plant is sufficient to destroy it.

Spraying with Copperas.—During two years we have carried on experiments in the control of dandelions in lawns by means of a spray composed of iron sulphate dissolved in water at the rate of 1 1/4 pounds to the gallon. This makes a solution of approximately 15 per cent strength. Other strengths have been tried, but so far as our experience goes this has been as effectual as the stronger solutions.

The solution should be applied in the form of a fine forcible spray and should cover every square inch of the lawn. Enough should be applied so that every plant is thoroughly wet with the mixture. In our experiments we have found that one gallon of the solution will usually cover a space 10 by 15 feet. About three applications are needed at intervals of ten days to two weeks apart, depending somewhat upon the rapidity of growth of the dandelions. The lawns should not be watered for 48 hours at least, after the spray is applied. The grass will be darkened at first, but will soon recover and will have a deeper green throughout the remainder of the season.

Our results here during the two seasons indicate that the middle or the latter part of summer is perhaps the better time to do the work. Our experimental plats last season, while not entirely cleared of dandelions, showed a reduction of more than 90 per cent in the number of plants at first present. The whole college campus was sprayed with a power outfit, but for some reason not nearly so good results were secured as on the experimental areas. This is probably due to the more thorough spraying on the experimental plats where personal work was done.

Hints on Spraying.—For a lawn of moderate size a bucket spray pump is the best kind to use. For larger areas, one of the pumps mounted on a barrel supported on wheels is suitable. The principal thing is to have an outfit which can give a very fine and forcible spray. The more forcibly the spray is applied the better it will be driven into the crowns of the dandelions, which seems to have something to do with its effective-

ness. Iron sulphate in granulated form may be obtained from the American Steel and Wire company, which has an office in San Francisco, or from local drugstores or hardware stores. The solution should be used within a short time after it has been prepared or it does not keep well.

LUPINES AGAIN UNDER SUSPICION.

To the Editor: I am sending you some weeds that are growing on my cattle range this year. I have had several young cattle die lately, and I want to know what these weeds are, whether they are poisonous to cattle; and if so, how they affect them.—J. A. Weldon.

[Answered by Dr. H. M. Hall.]

The plant mentioned by your correspondent is a species of lupine, known botanically as *Lupinus albus*. It is quite probable that the seeds of these plants are poisonous in the manner common to lupine seeds and that this has been the cause of the trouble. The matter was discussed in some detail in the Pacific Rural Press of May 6, 1916, in which the symptoms of lupine poisoning are given at length.

GREEN LUPINES ARE VALUABLE.

To the Editor: Please find enclosed plant, which I have been told is a vetch. I planted very clean rye and this grew up heavily with it. It stood heavy frost and snow well. Kindly advise me as to what it is and its food value.—C. K. Sherwood.

[Answered by Prof. P. B. Kennedy.]

The plant is one of the small annual lupines, *Lupinus micranthus*, an extremely abundant lupine in many parts of California. Waste places and fields are often covered with it. There are a great many of these lupine species in California which seem to vary considerably in their palatability to stock. This one having very fine leaves and being quite tender in spring, is eaten to a considerable extent along with the other forage and grasses growing among it. As it is a legume its food value no doubt is quite high, particularly in protein: a word of caution, however. Every year our attention is called to the poisoning of stock by these lupines when in the seed stage, and we have every reason to believe that the seed of all of them is poisonous as in nearly every case submitted it seems to be a different species. The reason that more poisoning does not take place is because the plants are in the seed stage for a short time only. The seeds are thrown out of the pods as the latter twist in a spiral manner. Stock eating the plants after the seeds have been shattered from the pods never seem to be affected.

Where these native lupines grow abundantly in orchards, they should be encouraged and perhaps not plowed under until the plants have gone well into seed, so as to leave the ground naturally seeded without cost for another year.

The county supervisors ought to plan and carry out a compulsory ground squirrel extermination campaign for a period of several years. They will if enough voters insist.

WHEAT SEED TREATMENT GIVES HEAVY CROP.

[Written for Pacific Rural Press.]

Thirteen thousand sacks of heavy smut-free wheat were grown last season by Chas. Rieck on about 1450 acres of summer fallowed land in southern Tulare county.

Its plumpness and lack of smut were largely due to seed treatment.

The grain from choicest sections of the ranch is kept separate when harvested. It is stored in a 900-sack bin. A chute leading from the bin lets the seed wheat fall into running water. The good plump seed wheat sinks and is caught while all oats, chaff, light shrunken grains, etc., float away. Then the seed is treated with bluestone for smut and dried ready for planting.

The bluestone treatment consists of putting the grain into a tank containing a solution of one-pound copper sulphate per four gallons cold water. This insures application of the fungicide all over each grain, much more thoroughly than if dipped in sacks. It is dried as soon as wetted.

SWEET CLOVER ON SALT GRASS.

[Written for Pacific Rural Press by J. McGann, Independence, Inyo Co.]

Answering the question, "What is a good crop to plant on salt grass sod?" in your issue of July 1, melilotus alba, commonly known as white sweet clover, has proved fine for me.

I planted 15 or 20 pounds per acre on salt grass sod, and the following year cut the first crop for hay and the second for seed. Just shake the seed among the salt grass and then disk it in. If you don't want to disk it, just irrigate; but be careful not to give it too much water. It will drown out easy and turn yellow.

This sweet clover makes fine hay and is the finest kind of pasture for cattle, hogs, and sheep. It does not bloat; and is better for hogs than alfalfa. It is the greatest of all honey plants, and one of the finest fertilizers there is.

SILK GROWING IN CALIFORNIA.

To the Editor: Mulberry trees thrive in California. If I should raise some silkworms, could I sell their product?—Sub.

[Answered by A. F. Barnard, Belding Bros. of Cal., Silk Mfrs.]

[As far as we know, the raising of silk cocoons in this State has not been successful because after the cocoon has been produced there is no market for it, as there are no silk winders to speak of in the entire United States.

The silk worms and mulberry trees can be raised successfully here, and in other parts of this country, but the high cost of labor makes it prohibitory when the winding of the cocoon is considered.

We understand that a small quantity of cocoons is raised in San Diego, but these are sold for curiosity or souvenirs to Eastern tourists; not raised for commercial purposes.]

CLOSED LEAKS AROUND SILO DOORS.

[Written for Pacific Rural Press.]

When he built his concrete silos A. Haley of Newark was warned

against leakage around the doors, which were oval shaped, because of the difficulty in getting them to fit tight enough to exclude air.

As a precautionary measure he made rubber gaskets, the same size and shape of his doors, tightening the door against these instead of against the concrete. After four months, during which time the silo has been full of first cutting alfalfa, no loss around the doors had been experienced.

KILLED MORNING GLORY.

To the Editor: I have noticed a great many inquiries about the eradication of morning glory.

Three years ago this July, I had a patch about 40 feet across that

covered the ground completely. I began at one side, smoothed a strip the width of building paper and laid the paper on it. Then I smoothed another strip, throwing the dirt back upon the first strip of paper. Then laid the next strip lapping a couple of inches and continued in the same way until it was all covered. I left this until I plowed the next spring; and there has never been any morning glory come up since. I have killed several small patches by using newspapers in the same way. J. B. Hendricks. Lakeport.

OREGON RURAL CREDIT PLAN.

There is now being circulated for

signatures an initiative petition for a rural credits measure, of which C. E. Spence, Master of the Oregon State Grange, says:

It harmonizes with the proposed federal legislation for rural credits, which it would supplement.

It is self-operating, requiring no additional administrative expense, going into the hands of the State Land Board, consisting of the Governor, Secretary of State and State Treasurer. Bonds for obtaining the loan funds can be marketed at lower rates than farm mortgages, while at the same time the state merely "goes security," for which it is amply protected by mortgages on land at double the value of the loan.

Upper Salinas Valley Fair, Sept. 19-23.

A Great Increase in Railroad Wages Means Higher Freight Rates and a Burden on Agricultural Prosperity

Do you think the railroads ought to increase the wages of their highly paid train employes \$100,000,000 a year?

No great increase in railroad wages can be made without directly touching your pocketbook. Out of every dollar you pay the railroads 44 cents go to the employes.

Compare the wages of these men (who have refused to arbitrate their demands for higher wages, and are threatening to tie up the country's commerce to enforce them) with those of other American workers—with yours.

On all the railroads in 1915 three-quarters of the train employes earned these wages:

	Passenger		Freight		Yard	
	Range	Average	Range	Average	Range	Average
Engineers.....	\$1641	\$2067	\$1455	\$1892	\$1005	\$1526
	3983		3505		2445	
Conductors.....	1543	\$1850	1353	\$1719	1055	\$1310
	3004		2932		2045	
Firemen	943	\$1203	648	\$1117	406	\$924
	2078		2059		1633	
Brakemen	854	\$1095	755	\$1013	753	\$1076
	1736		1961		1821	

You have a direct interest in these wages because the money to pay them comes out of your pocket.

Low freight rates have given American farmers command of the markets of the world.

With two-thirds of the cost of operating railroads the wages paid labor, any great increase in labor cost inevitably means higher freight rates.

A \$100,000,000 increase in railroad wages is equal to a five per cent. increase on all freight rates.

The railroads have urged that the justice of these demands be determined by the Interstate Commerce Commission (the body that fixes the rates you pay the carriers), or by a national arbitration board. The employes' representatives have refused this offer and have taken a vote on a national strike.

This problem is your problem. The railroad managers, as trustees for the public, have no right to place this burden on the cost of transportation to you without a clear mandate from a public tribunal.

Mechanical Power on the Farm.

SILO WET OR WEEDY ALFALFA.

[Written for Pacific Rural Press.]

Alfalfa silage has an odorous reputation, but it is not a bad odor if put up right, according to C. W. Main of Corona who fed it to his purebred and grade Guernsey herd last year, in the barn. It compared favorably with corn, in palatability, and there was no more waste on top than of corn silage. The cows cleaned it up where the foxtail in it had not become too dry before cutting.

No change in milk flow was observed when the feed was changed from pasture and alfalfa hay to alfalfa silage in the barn and hay outside. The average feed was 15 pounds silage twice a day, plus what hay they would clean up. No bloat was ever noticed.

Mr. Main has two silos; one of concrete with 119 tons capacity, the other of resaw and paper, 109 tons. The concrete is preferred on account of durability.

He cut about 70 acres of alfalfa, half foxtail. Half of it got entirely too dry, and was stacked for hay. The other half filled the two silos about 2/3 of their capacity.

Longer Lengths Cut Fast.—It was run through a 16-inch Papec silage cutter which was regulated to chop 2 to 2 1/2 inch lengths. Alfalfa can be cut much longer than corn because it packs better on account of its smaller stems. It runs through much faster. One man in the silo packs it as well as two would pack corn. A 12 h.p. Fairbanks Morse engine furnished the power to cut and elevate Mr. Main's alfalfa. Three teams were kept busy with a 1/4 to 1/2 mile haul, one loading, one unloading, and one on the road, all the time. Besides the teamsters, two men loaded in the field, one man ran the feeder and engine, an extra man helped unload, and one worked in the silo.

Alfalfa is not considered profitable for silage when it would make good hay. But when it is very weedy, the foxtail, as hay, is likely to prove more injurious than beneficial. And if it is wet after cutting, its salability is so reduced that if there is much of a haul to market, there is no profit. The foxtail improves, rather than injures, alfalfa silage.

Wilt before Siloing.—Alfalfa should be wilted a little before siloing; otherwise it will become slimy, mushy, sloppy.

It should be cut and siloed greener when there is lots of foxtail in it, than when pure alfalfa. If wet in shock, Mr. Main would put it into the silo pretty wet—if wet on ground, he would allow it to dry a little more. But when put in too dry, it does not pack, turn black, and ferment as it should. If cut in the morning with dew on, it should be raked in afternoon if clear weather. He cut one

day and raked the next last year, but it got too dry. If old, coarse, and heavy when cut, he would silo it greener and fresher. No water was added while filling.

ALFALFA MEAL FOR PIGS.

To the Editor: Please give data regarding alfalfa meal for hogs.—A. M. M., San Jacinto.

[Answered by Williams Patent Crushers and Pulverizer Co.]

From one manufacturer of alfalfa meal, we repeat the following: "We have several customers who feed meal to hogs in the following manner: have two barrels holding 100-lb. sack easily; empty a sack in one of them, place a heavy piece of burlap over the top of the barrel and pour sufficient water over the meal to moisten same thoroughly, let it stand for a day, next day fill the other barrel same way, feeding out of each in turn one day after treating. This allows the meal to thoroughly dampen and slightly sour before feeding and the hogs get better results than immediately feeding after dampening. However, as a general and quick rule, feed alfalfa meal as you would bran. Meal fed as above with a mixture half ground barley also dampened will produce, of course, better results, as it makes a more evenly balanced ration."

A ration from another manufacturer:

"Feed in form of swill: One-third alfalfa meal, two-thirds shorts. (For hogs and brood sows.) One-third alfalfa meal, two-thirds corn. (For fattening hogs.)"

We also call attention to the fact that in the Southern States, the Carolinas, Georgia, Florida, Alabama, Tennessee, Arkansas, Mississippi, Louisiana, Texas and Oklahoma, in the past several years we have sold in the neighborhood of 1000 of our small grinders to farmers and ranchers. These people formerly grew nothing but cotton.

LOS ANGELES TRACTOR AND IMPLEMENT MEN MEET.

At a called meeting of the Los Angeles Traction & Implement Dealers Association held August 4 for the purpose of selecting a definite time and place for the big tractor meet to be held near Los Angeles, it was decided to hold this demonstration at Puente, California, on September 19, 20, 21, 22, and 23. The place selected is considered ideal, it being on the main valley boulevard connecting Los Angeles with the interior country, and affording a splendid means of transportation for the thousands that are expected to attend. Every facility for the convenience of the crowd has been arranged for. The citizens of Puente will furnish free water for those in attendance and for automobiles and tractors. The Association will have conveyances for bringing the crowds that will come by Pacific Electric, and the grounds are reached direct by the Southern Pacific. Also a thirty minute schedule is maintained by the Valley Stage lines. Practically every tractor and implement firm with headquarters in Los Angeles will be represented at

LAYNE & BOWLER HIGH DUTY PUMP

Here is illustrated the Layne & Bowler direct connected, oil-balanced turbine pump, for high duty, deep well service. It is used for lifts greater than 200 feet. This is beyond all question the most compactly designed high duty pump ever constructed.

Our special oil-balance feature, we believe, is the greatest single improvement made since the advent of the centrifugal pump, and it has made it possible to use the centrifugal pump for all heavy duty requirements.

Our new Catalog No. 25 fully describes and illustrates this pump as well as many other styles. Write at once for a copy.

TWO IRRIGATIONS FOR EACH ALFALFA CROP.

[Written for Pacific Rural Press.]

By watering his alfalfa twice for each crop C. Jensen of Chowchilla has gotten maximum results on his 10 acres this year which was seeded a year ago last spring.

Like most of the irrigated ranches in that district, that of Mr. Jensen's is dependent upon pump irrigation and it is on this account that he is able to irrigate a week after he cuts a crop and again 10 days before cutting the next crop. By this process he gets a crop in five weeks during the summer time, having cut four ton-and-a-half crops before August this year.

Under pumping plant conditions Mr. Jensen has found 33-foot checks satisfactory but does not believe long checks can be economically watered in his location.

The rather remarkable thing about Mr. Jensen's stand of alfalfa is the fact that 40 tons of barley hay were harvested from the ten acres with the first cutting after planting, last spring.

Previous to seeding the land to alfalfa it had been seeded to barley and the volunteer barley in the alfalfa was so thick that it was expected to entirely crowd out the young alfalfa. But notwithstanding the heavy nurse crop, as the barley in reality was, a perfect stand of alfalfa was secured on the entire place.

ELECTRIC LIGHT IN SILO.

[Written for Pacific Rural Press.]

Instead of carrying a lantern around with them night and morning in shoveling silage out of the concrete silos, workmen on the Stephens Dairy near Mission San Jose have light from an electric lamp hung in the roof of the silo.

This electric globe is equipped with a reflector which gives a strong light and very much simplifies the work of unloading the silo at night.

POWER NOTES.

Don't forget the State Fair tractor demonstration September 4.

A free short course in farm tractors at University Farm, Davis, will be held Nov. 13 to 24.

A big tractor demonstration near Los Angeles will be held Sept. 19 to 22 under auspices of the Southern California Tractors Association.

The explosion in an engine is not so instantaneous as it sounds. Two spark plugs in a single-cylinder upright engine give sparks on opposite sides of the cylinder at the same instant to make the explosion quicker.

Oxidation of rubber which makes it brittle, is said to be due to the combination of air with sulphur adulterant of the rubber, making sulphurous acid. It may be prevented by frequent washing with dilute ammonia.

Ninety per cent of the registration and license fees paid in 1915 by automobilists to the States, or \$16,213,387 was spent for building and maintaining county and State roads according to U. S. Dept. Agriculture.

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

ELECTRIC APPLIANCES include CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS and every other appliance that is needed in the modern home, not forgetting **ELECTRIC FANS.**

We carry these appliances in many of our branch offices, and will be glad to have you call and inspect them. Where we do not carry them we will be just as glad to give you our expert advice.

"PACIFIC SERVICE" is always "At Your Service."

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of

strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre

Oats averaged in 1915 over 45 bushels per acre

Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from \$12 to \$30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. There is no war tax on land, nor is there any conscription. For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Government Agent, Canadian Bldg., Exhibition Grounds, San Diego, Cal.

Canadian Government Agent.

General Agricultural Review.

GRAINS AND FIELD CROPS.

Hop picking commences in Tehama county next week.

Sugar beet harvest started in San Joaquin county this week.

One of the largest Seattle grain elevators closed recently and indefinitely for lack of ships.

It is hoped to control sugar beet leaf hoppers with Hawaiian bugs imported by the State Insectary.

Alfalfa weevils are slowly spreading in the inter-mountain basin, but none are yet known in California.

Wholesale granulated sugar was recently quoted by the Western Sugar Refining Co. at \$7.65 per cwt.

Amador county farmers are threshing a good crop of wheat, but not so good a crop of barley and oats.

Ed Powers of Manteca recently shipped a carload of watermelons mostly weighing 40 to 75 pounds each.

The Alameda County Farm Bureau is displaying sudan grass which grew 8 feet tall in 31 days near Pleasanton.

Some 50,000 men are harvesting the wheat of the Middle West beginning at the south and moving north as the wheat ripens.

J. Freitas of Knights Landing estimates 11,000 acres more of beans in Sutter basin this year than last; and a fine crop coming.

Joseph Letrich of El Centro brought the first load of Durango cotton to be ginned Aug. 3, and claimed the \$50 prize.

Barley in warehouses of San Francisco, Stockton, and Port Costa Aug. 1, contained 53,377 tons barley; wheat 13,699 tons; beans 88,925 sacks.

Arbuckle grain is reported much better than expected: barley 20 to 30 sacks per acre and wheat about 25. Much of it has sold at \$1.40 per cental.

Over \$1,000,000 more is to be distributed to its growers by the Great Western Sugar Co. in Colorado than their contract price. This is 50 cents a ton increase.

California sugar factories are to pay a second bonus of 50 cents per ton for beets if sugar does not fall below 4½ cents. The total 1916 crop is estimated at 850,000 tons.

Potato growers who wish to sell certified seed should communicate with State Inspector W. V. Shear, care of Horticultural Commission, Sacramento, at once or sooner.

The recent spectacular 6½-cent rise in Chicago on wheat was largely due to reports of hail and rust damage to the Canadian crop, but these reports are denied by Canadian officials.

In the two months' Turlock melon harvesting season to close Sept. 15, it is estimated that 3000 carloads of cantaloupes and over 1000 carloads of watermelons will have been sold for \$2,000,000.

Cotton production in U. S. this year is estimated at 12,916,000 bales by the U. S. Dept. Agr. on basis of the crop condition July 25. This is 72.3 per cent of normal, but larger than last year.

The Pacific Rice Growers Ass'n is signing up new members on the strength of its record in moving the crop and getting the best money for it. Contracts are not binding unless 75 per cent of growers sign.

Sec. Geo. E. Harvey of the Pacific Rice Growers' Ass'n urges every rice grower or business man interested in rice to attend the Railroad Commission hearing on freight rates at Biggs, which has been postponed to Aug. 15.

American cotton mills using American cotton of recent years are causing Lancashire England spinners and working people much anxiety for raw material to keep their 60,000,000 spindles and 800,000 looms busy.

Chairman J. W. Jennings of the committee appointed at Stockton last May to carry on a campaign of education favoring bulk handling of grain, writes that he has been appointing extra members and the campaign will soon begin.

Recent figures on this year's Sacramento Valley rice acreage are as follows: Butte county 27,000 acres, crop estimated at 800,000 bags; Yuba 2400 acres; Glenn 16,000 acres, estimated 56,000 bags; Yolo 15,000 acres and 60,000 sacks; Colusa 23,000 acres; Sutter 2,000 acres; Solano several hundred.

DECIDUOUS FRUITS.

Kings county shipped 114 cars of fruit to the East before Aug. 1.

Sonoma Gravensteins are reaching New York in first-class shape.

A Ceres girl is credited with packing 100 boxes of peaches in five hours.

Grass Valley Bartletts brought \$3.15 per box for the first carload in New York.

Four acres of young Elbertas are bearing about four tons per acre for F. H. Camp of Corning.

Alhambra valley, Contra Costa county, has been shipping three to five carloads of pears daily.

Apple packing records were recently beaten by two Sebastopol women, each of whom made a record of 160 boxes.

Infantile paralysis caused the Nat'l Apple Shippers' Ass'n to change its meeting place for Aug. 16 from New York to Niagara Falls.

The alkali resistant Chinese peach described in our columns over a year ago seems to be proving itself worthy in Butte and Sutter counties.

The Central California Canneries at Sacramento are doing 50 per cent more business this year than last according to Manager L. H. Stewart.

The threatened railroad strike would not only put a lot of us temporarily out of a job, but it would keep a surplus of fruit in California.

A Colusa county orchardist is reported to have saved his young trees from rabbits by planting four rows of sudan grass around his orchard.

Horticultural Commissioner W. H. Volck last week held up a carload of green Bellflowers awaiting a statement that they were intended for cold storage or export.

D. F. Norton, Horticultural Commissioner of Nevada county, has acted under the Standardization law by holding 48 boxes of scabby pears until they were repacked.

Sebastopol berries are reported by W. I. Newcomb of the Berry Growers to have been selling in the East at 25 cents per crate better than the Eastern home-grown stuff.

The normal pack of the Sebastopol Apple Growers is 1000 boxes per day, but they put out 1606 boxes one day recently. They are putting out 7000 to 9000 boxes per week.

Prunes look to be a full crop in Kings county and peaches are also turning out well. Green fruit shipments have stopped, but drying of peaches is well toward completion.

The Cal. Fruit Exchange recently sold a carload of Loomis plums and peaches in New York for \$2063. It is said to be the highest price of the year for tree fruit except for cherries.

The U. S. 1916 fruit crop is reported by the Dept. Agr. as below that of 1915 in practically every class, but on the same date we have

reports of California having a record fruit year in tonnage.

The Watsonville Apple Distributors have permission to solicit stock subscriptions provided that such subscriptions shall be void unless 7,200 shares are actually sold at par before June 1, 1917.

Immature prunes should be kept separate from the main crop to avoid spoiling the sale of the whole crop urges Napa Horticultural Commissioner J. J. Fox. Not many sales have been made in the valley yet.

C. B. Bills of Sacramento is credited with the statement that the East is crying for our fruit and we cannot supply more than 75 per cent of what they want; and that they are paying 5 cents each for pears, 2½ cents for plums, and 2 cents for peaches.

Market Director Weinstock quotes U. S. Consul General Gottschalk of Rio Janeiro as authority for saying that Brazil is a very hopeful market for California dried fruit, especially since our Washington "politicians" have procured a treaty giving us a 20 per cent preferential tariff as against Liverpool and Hamburg. Even so, our exports to South America have mostly gone via Europe.

Tulare Horticultural Commissioner Chas. Collins states that the peach crop as a whole will be a normal one, the canning varieties being shorter than the drying varieties. Prunes are good and a hundred per cent crop now looks possible. Shipments of Thompson Seedless grapes are about finished and Malagas are going forward. Mr. Collins has 10 inspectors at work in packing houses and says that some unripe fruit is being rejected.

June sales of confiscated dried prunes in British prize courts consisted of lots varying from 16,000 to 40,000 boxes which sold around two cents per pound. Apricots and kernels have also been sold there at

Sturdiness

A big, husky carcass built up with extra plies of stoutest fabric—

An ample cushion of great resiliency that absorbs the road shocks—

A tough, road-gripping tread of durability way beyond the ordinary—

Easy riding, big mileage and a low price—

That sums up the Savage Tire.

And the Savage Grafinite Tube is its best running mate.

SAVAGE TIRES

BRANCH STORES:

San Diego - 936 2nd St.
 Los Angeles, - 700 W. 7th St.
 San Francisco, 1125-29 Van Ness Ave.

about half of California prices, with no consideration of high freights.

Heavy canned fruit orders from the East and Great Britain are said to be rushing the canneries of the State. The embargo is to be partially removed Nov. 1.

CITRUS, NUTS, OLIVES.

Seventh National Orange Show February 20-28.

Orland, Banning, and Arbuckle almonds are being harvested.

The Tulare County Citrus Fair is likely to be held in mid-December.

The Cal. Almond Growers' Exchange has gained 271 net new members to Aug. 1. Four new growers signed up Aug. 2.

Boydston Bros. of Lindsay, who have worked up a fine reputation for their own oranges, have recently joined the Cal. Fruit Growers' Exchange.

S. B. Onyett, a veteran olive grower of Palermo, has sold his entire crop of Sevillanos and Ascolanos to a Los Angeles olive packer at \$235.00 per ton tree run.

The Co-operative Orange Ass'n of Lindsay recently voted to withdraw from the Mutual Orange Distributors and join the Lindsay-Merryman Exchange, which markets through the Cal. Fruit Growers' Exchange.

"Only 17 cars of oranges and 13 of lemons were shipped from the Riverside district last week, but at prevailing prices, these 30 cars will bring the growers close to \$40,000," says the Riverside Daily Press Aug. 4.

According to Chas. Collins, Horticultural Commissioner of Tulare county, the present indications are that the coming orange crop will not be heavy, although normal crops of lemons and grapefruit are expected. The drop was later this year than usual due to navel rot.

State Market Director Weinstock is sending a voluminous letter to about 7,000 citrus growers recounting the history and nature of his unsuccessful effort to get the Exchange into a State Bureau of Distribution. He urges the individual growers to signify to their marketing officials that they want the Bureau.

The independent Antioch Almond Growers' Ass'n advertised for bids for its crop. Three packers put in bids, but when they were read, one was blank. The offending bidder tried to substitute a higher bid than the others, knowing what the others had offered, but another set of bids was called for Aug. 12. "Trix in all trades."

The California Walnut Growers' Ass'n is sending to thousands of American retailers, jobbers, etc., a mailing tube containing a few nuts and a circular to be read while eating the nuts. This is to put the prospective customer in a good frame of mind to buy the Diamond Brand cartons which contain a full pound net this year. The sample nuts are 8 or 9 months old and being still good, create a favorable impression.

GRAPES AND SMALL FRUITS.

Sutter county is fighting phylloxera.

Arbuckle shipped a Tokay carload this week.

The first car of Malagas to reach Chicago sold for \$2440.

Tehachapi marketed 2500 crates of currants at \$1 per crate.

Lodi grape growers are organizing a bureau of market distribution.

The frost-damaged Tokays of San Joaquin county seem to have a good crop, but six weeks later than the first crop.

As much as \$100 per ton have been received for Thompsons, though some growers contracted last winter at \$20.

The Sutter county Thompson crop will be 20,000 tons from 6000 acres according to Horticultural Commissioner H. P. Stabler.

The first crate of Winters Tokays sold in New York Aug 3 for \$4.20. Vacaville Tokays brought \$4.75 the

same day, but only \$1.85 in Chicago.

MISCELLANEOUS.

No Orange County Fair this year.

The National Farm Loan Board has been appointed and confirmed.

Farmers' Short Courses, University Farm, Davis, Oct. 2-Nov. 10.

To levee and drain 26,000 acres in tract 999 at a cost of \$600,000 is the project of the California Delta Farms Co.

The \$6,000,000 Tulare Lake reclamation project is nearly ready for submission to the State Reclamation Board.

The Salt Lake Railroad is to build a \$2,000,000 electric line from Pico

to Santa Ana. They hope to build many other feeders.

The Southern Pacific is to build in San Francisco a 10-story \$1,250,000 building with a frontage of 275 feet on Market St. for use of about 2000 of its San Francisco employees.

The Alpha Farm Bureau in Madera county on Aug. 3 appointed a committee to take the necessary steps to complete a farm loan association under the new National Rural Credits law.

LIPPIA LAWN IN SHADE.

To the Editor: Is lippia a hardy grass for planting under a dense grove of oak trees? Will it become

uncontrollable like Bermuda grass? —G. E. F., Fair Oaks.

[In the issue of June 17, J. F. Swett of Martinez says you can hoe off lippia turf, spade up the ground, and have it absolutely free of the grass. Mr. Swett believes that lippia will grow even in dense shade; but will not mat smoothly as it does in sunlight. A very good lippia lawn may be had in a white oak grove where there is scattered sunshine and some sun morning or evening.]

Udo is a Japanese vegetable similar to asparagus but not much grown in California.

Your Neighbor's Car

Suppose He Buys a Hudson Super-Six

One thing we can't forget in buying cars. That is pride of ownership. The car is a pleasure vehicle. And it spoils the fun to be hopelessly outrivaled in about the same-class car.

The Hudson Super-Six has proved itself supreme.

With this patented motor—certified a stock motor—it has done what no other stock car ever did.

It has made faster speed. It has done better hill-climbing. It has shown quicker pick-up. It has gone 1819 miles in 24 hours, breaking the best former stock car record by 52 percent.

It has beaten race cars by the dozen—cars of a very costly type. It has shown much more power than this size motor ever before developed. It has proved matchless endurance.

Suppose your neighbor gets this car. And you, while paying as much or more, get something less efficient. How will you feel when the two cars meet?

What These Things Signify

You do not care for reckless speed. Such power is rarely needed. But the Super-Six has the capacity. You know it to be the master of the road. It will do what you want without taxing half its ability. And that means economy.

It will cover more ground than lesser cars, without going any faster. This because of its quick get-away when you slow down or stop.

Its greatest supremacy—that of endurance—means years of extra service. How would you feel to have a like-class car excel yours in these respects?

Means 80% More Efficiency

The Super-Six motor—a Hudson invention—adds 80% to motor efficiency. That is, from a small, light motor it gets 76 horsepower. The same size of motor heretofore yielded us 42 h. p.

This result comes through ending vibration, the cause of motor friction. It gives such smoothness as you never knew before. And it means a long-lived motor.

It comes in a car, evolved under Howard E. Coffin, which has long stood for the acme in fine engineering. And it comes in the handsomest, best-equipped model that Hudson has ever designed.

If your neighbor gets it, and you don't, it may mean to you years of regret. In looks and performance, in prestige and endurance, he will have the advantage of you. Your Hudson dealer can prove these things beyond any possible question. And you should know them before you buy any high-grade car.

Any Super-Six owner—there are now more than 10,000—can tell you what it means to own one.

7-Passenger Phaeton, \$1475 at Detroit—Seven Other Styles of Open and Closed Bodies

HUDSON MOTOR CAR COMPANY
DETROIT, MICHIGAN

The World's Most Low Priced Announcing the

31 1/2 Horsepower

Overland
TRADE MARK REG.

This newest Overland is the world's most powerful low-priced car.

It has a 31 1/2 horsepower en bloc motor that is a perfect marvel for speed, power and endurance.

By increasing the bore of the motor from 3 1/8 to 3 3/8" we are able to offer a power plant which at 1950 R.P.M. develops full 31 1/2 horsepower.

Tests under every condition in all parts of the country demonstrate that it easily develops better than fifty miles per hour on the road.

Speed of course varies under different conditions, but in practically every instance

it has been getting fifty miles an hour and with ease.

We have scores of telegrams showing that eighteen to twenty-five miles per gallon of gasoline is not unusual.

The performance of this car is almost beyond belief.

Take any other low-priced car on the market. Pit it against this new Overland. Compare them for sheer speed, for abundance of power, for riding comfort and economy, and you'll find this car will back anything else clean off the boards.

That's a strong statement, but a fact nevertheless.

4 cylinder en bloc motor
3 3/8" bore x 5" stroke
104-inch wheelbase
4-inch tires

Company, Toledo, Ohio

U. S. A."

Try it yourself and see.
Here are more important facts.

It has four-inch tires which are more than generous for a car of this size.

Not only has it a large and roomy body, but it has an attractive, up-to-date streamline body.

It has the latest and most improved system of ignition.

It has the cantilever springs—the easiest riding springs in the world.

What's more, it's complete. Not a thing to buy. You get the finest Auto-Lite electric starting and lighting system, magnetic speedometer, one-man top, demount-

able rims and practically every accessory found on the highest priced cars.

From a driving standpoint, the new car is ideal. It's light, easy to handle and anyone can drive it.

Take one look and be convinced.

And mark these words—the car is destined to be regarded and referred to as one of the really great achievements of the great automobile industry.

Yet it only goes to prove how big production can cut cost and save you money.

First come, first served. See the nearest Overland dealer and place your order now.

With the Live Stock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

People continue to get gored by bulls all over the State.

A high producing cow must have more feed than a common one.

Dairymen continue to conduct dirty places and some of them are being fined almost daily.

More purebreds for the Napa State Hospital are to be purchased by Manager Owen Duffy on an Eastern trip late in September.

Maple Crest Pontiac Application, owned in Ohio, recently finished, a record of 1075.44 pounds fat from milk testing 4.59.

A half-acre dairy barn for 120 cows and 400 tons of hay was recently completed by A. S. Quadrus at Nord, Butte county.

A branch cheese factory has been established at Esparto by the Napa Cheese Co. They are handling 1000 gallons of milk daily.

Lloyd Wallace of Ukiah has a 35-cow dairy outfit modeled as closely as possible after the Carnation dairy at the Panama Pacific.

The new cheese factory addition to the Modesto creamery will begin work about Aug. 15 with capacity for the product of 200 cows.

The average production of 4081 cows in seven Western Oregon districts for the year 1915-16 was 4997 pounds milk yielding 227 pounds butterfat.

Three hundred and twenty rolls of short-weight butter were recently seized by the Sealer of Weights and Measures, and contributed to county institutions.

The Soledad Creamery called a meeting of dairymen recently. It was decided to organize a co-operative creamery and put up a permanent modern plant.

John Simas of Scott Valley, Siskiyou county, has installed milking machines for 200 cows, far from any railroad. Irrigation is needed here, and is being agitated.

Allenvail Topsy Walker made 23.32 pounds butter in seven days and 94.36 pounds in 30 days. She is to be sold at the Rhoades & McAlister sale at Rivera Sept. 19 and 20.

J. W. Benoit reports the sale last week of the registered Holstein bull Wayne Walhalla Colantha, whose sire is El Prado Wayne Colantha. The bull was purchased by Ray L. Morgan of Phoenix, Arizona.

The Western Meat Company's new cheese factory at Requa, Del Norte county, is about completed and is expected to be running by the time this is printed; 850 cows owned by nearby farmers have been signed up and the operators expect to handle at least 20,000 lbs. of milk from the start.

Manager Peck of the Visalia Co-operative Creamery at Visalia states that he will begin shipping butter East before the middle of August again, this carload making the seventh one this year. He says he expects the Eastern market for California butter to be good this fall. The last car he shipped was May 22 and Philadelphia said that it arrived in fine condition.

Mosetta Mutual Paul Johanna, now on official yearly test, has completed 182½ days of the test, producing 28.61 lbs. butter from 688 lbs. milk in seven days and 119.34 lbs. butter from 2883.6 lbs. of milk in 30 days

and 706.26 lbs. of butter from 16842.6 lbs. of milk in 182½ days, which is the greatest amount of milk and butter ever officially produced in the latter number of days, in the world. She will be continued on her official test for 365 days. She is a daughter of Prince Johanna De Kol 2nd, whose grandsire is a brother to the world record cow Finderne Pride Johanna Rue.

Miss Valley Mead De Kol Walker, owned by Mrs. Anita M. Baldwin, Santa Anita, recently broke the California State Senior Two Year Old record, completing her 7- and 30-day test on July 29, 1916, about 60 days after freshening. In seven days she produced 25.68 lbs. butter from 538 pounds of milk; and in 30 days she produced 100.00 pounds of butter from 2304.6 pounds of milk, which is more butter and milk than has ever been produced in the same time by a Senior two-year-old in the State. This 7- and 30-day record is also greater than the three-year-old California State record. Her sire, Prince Gelsche Walker, and 22 of his daughters including this heifer, were recently purchased from A. W. Morris & Sons, by Mrs. Baldwin. This addition to the list gives Prince Gelsche Walker three State record daughters. Her dam, De Kol of Valley Mead, produced 26.55 pounds of butter in 7 days, 107.78 pounds butter in 30 days and 1011.71 pounds butter in 365 days.

SWINE BREEDERS AND STOCK.

A Poland China sale will be held Sept. 20 at the Stanislaus Livestock Show and Exposition, Modesto.

Fred Ross of Kings county is fitting a nice herd of Poland Chinas for the State Fair next month.

Neither the Bernstein or Trewhitt herds of Poland Chinas from Kings county will be shown at the State Fair this fall.

The Butte City ranch is buying an imported Berkshire boar sired by Epochal, to mate with their Mayhew's Leader 6th pigs.

J. P. Walker of Tulare county is fitting up a small herd of Durocs for the Sacramento Fair. This is Mr. Walker's first trip to Sacramento.

Two carloads of mules were shipped from Arbuckle last week for the French government. P. E. Gaskill and J. A. Smith were the buyers. The price averaged \$125 to \$150.

If the present intention of the members of the Kings County Poland China Breeders' Ass'n is carried out there will be 200 head of registered hogs sold at their sale in October, of which number only 10 per cent will be boars.

Miss Josie Fuller of Imperial county, aged 17, has 50 porkers. Her figures for cost of production to market condition are 3½ cents per pound, but she spent too much time caring for them to win the University Pig Club prize.

A Ventura hog raiser lost about 100 hogs which had been wallowing in a spring supplied with water from arsenic rock. Another report of the same day tells of an old miner in San Bernardino county being found dying at an arsenic waterhole in the desert.

M. Bassett of Hanford will have one of the best show herds at the State Fair that he has ever exhibited, in fact one of the best Poland China herds that has ever been put in a show ring anywhere. His hogs at this time are in the pink of condition.

E. K. Carnes and F. H. Berdeen of Nimbus, Sacramento county, bought the Duroc bred sow Golden Lassie last January from J. K. Frazer of Denair for \$83 at the Cal. Swine Breeders' Sale. She farrowed 14 pigs March 20 and raised all of

them. Some of them as well as other stock will be shown at the State Fair.

The National Livestock Shippers' Protective League recently met in Chicago to perfect its organization which is to look after shippers' interests at stockyards, on the road, and at legislatures and Congress.

The average price paid to producers of the United States for unwashed wool during June was 28.7c per pound, which compares with 23.7c, 18.4c, 15.6c, 18.7c, 15.5c and 19.5c, respectively, in June of the past six years. These estimates are based upon reports of crop correspondents of the Bureau of Crop Estimates.

At the monthly meeting of the Stanislaus Duroc Swine Breeders' Ass'n, the by-laws and constitution were adopted. A consignment sale will be held during the Livestock Show and Exposition to be held at Modesto Sept. 18-23. Prof. J. I. Thompson of University Farm will select all hogs to be sold. Forty head of the choicest hogs obtainable will be auctioned.

STANISLAUS FARMERS' UNION LIVESTOCK SALE.

The Farmers' Union of Stanislaus county has organized the Stanislaus County Live Stock Sales Association and will hold their first sale at Modesto September 20 during the Live Stock Show and Exposition. The committee appointed by the Farmers' Union to handle this sale and the entire marketing problem is J. J. Hardy, C. L. Sanders, Otis L. Linn, all of Modesto. The Market Manager, Otis L. Linn, expects to have assembled several cars of hogs, one or more cars of veal calves, and other farm products.

Because of a lack of uniformity in live stock feeding it is difficult for buyers to fix the value on animals—particularly hogs—without seeing them.

Raisers and breeders of swine are dissatisfied in many instances be-

Sanitary Barn and Dairy Equipment

Stalls, Stanchions, Feed and Litter Carriers

Catalogs and Barn Plan Books Free.

CALIFORNIA HYDRAULIC ENGINEERING & SUPPLY CO.,
68 Fremont St., San Francisco.

cause grain-fed hogs sell for no more money than those that have been alfalfa grazed or that are tubercular by having been fed infected milk.

The committee will send out tagging slips to the farmers on which those having live stock for sale will enter a description giving age, weights, and method of feeding.

With reliable information of this character the buyer will know what he is buying and the seller will learn that proper feeding brings its reward.

This will be the first livestock marketing sale of its kind ever held in California.

There will be no public outcry of the market animals.

CARRUTHER'S BERKSHIRE SALE.

The Carruthers Berkshire sale, August 2d, at Mayfield, was not only a record breaker for prices on this Coast, but we understand tops any sale held in the East so far this season by \$10 per head. One of the Rural Press field men, who is recently from the East, and who attended the sale, said: "It was the most remarkable sale I ever saw, and I have helped in possibly 150 sales. Up to the time I left the sale, only three hogs were started for less than \$100 and only two sold for less than \$100. No bid in the entire day was less than \$5, and the average of sale was \$178. I never in all my sales experience saw anything its equal."

Mr. Carruthers reports that since the sale he has had many inquiries for more foundation stock. As the hogs sold were all entered for exhibition at the coming State Fair, readers will doubtless have the pleasure of seeing them there under the names of their new owners.

H. L. and E. H. Murphy paid \$405 for the three-year-old sow Rival's Pointer Star, the top price of the sale. Jas. Mills was the largest buyer, 12 sows and one boar. He intends showing at the State Fair and took advantage of the sale to fill his classes.

Following is the list of buyers and prices paid:

BUYERS, STOCK, AND PRICES.			
Name of Purchaser.	Hog	Sex	Farrowed Price

Napa County Fair, Sept. 14-16, is to be managed by H. H. Whitman, under auspices of the Farm Bureau. Prizes will be liberal, but there will be no races.

Reduced Freight on Silos

Beginning August 1, we are shipping Indiana Silos in carload lots to points in the Sacramento and San Joaquin Valleys.

The carload freight rate will mean a big saving over local freight rates to the man ordering one or two silos.

This is going to be a banner year for the

INDIANA SILO

in California and every other state. Farmers and stockmen know that silage is the only way to overcome high cost of feeding. They know they must have a silo, to get full value from their corn crop.

Over 60,000 Indiana Silos have given satisfaction to American farmers. This standard silo is now built on the Pacific Coast. We use select Oregon fir staves from our own mills. Experts say that fir is the best silo wood.

Write today for our Free Silo Book, and learn how much you can save by our carload method of shipping silos.

We also offer terms to responsible farmers.

Methods of a Progressive Cattle Company.

[Written for Pacific Rural Press.]

To produce cattle at a minimum expense is the goal which every progressive cattle man is hoping for and in this respect Robinson Bros. of Merced county are perhaps as far advanced as any concern in the State.

The ranges of this company are located largely in the rolling foothills adjoining the Sierra Nevada mountains, comprising some 30,000 acres, all of which are free from timber and fenced, with an average carrying capacity of one head to 10 or 12 acres.

Water is one of the problems on much of their range lands; but they carefully conserve water from winter rains on part of their land and pump in other places. The range dependent upon natural water is fed off while water is still available.

Calving season here starts as early as December and continues till May 1, the endeavor being to have the calves come when green feed is abundant. In order that the mother may have a better supply of milk and consequently give the calf a better start. By this system the calf grows with the feed till the feed dries up, by which time it is old enough to be weaned and take care of itself.

That their percentage of calves may be high, unusually good care is given the heifers with their first calves, these being run on a separate range before calving and carefully watched in order that they may be assisted in calving when the need arises. In this connection it is interesting to note that fully 10 per cent of the heifers need this assistance.

Contagious abortion is another factor which has never worked havoc in the herds on this ranch, largely due, it is thought, to the care exercised in buying bulls from herds free of this disease.

One bull to every 20 cows is the custom, and while more cows could be served in a smaller herd, the smaller number of cows is thought advisable when so many cows are being run, in order to insure early and sure breeding, which does not result if the bulls are overworked during the short breeding season.

Purebred Sires.—For years past it has been the practice of this company to maintain Shorthorn breeding in their cow herd by use of purebred and registered Shorthorn bulls. This is deemed advisable on account of the superior milking qualifications of the Shorthorn as compared with the Hereford and an idea that they have better bone.

Notwithstanding their preference for Shorthorn breeding cows, they like the Hereford steer because of his ability as a rustler and in withstanding the wet winters. In order to fill both of these demands they breed to both Shorthorn and Hereford bulls, selecting the best Shorthorn heifers for breeding purposes when calves, and turning the balance into the beef herds.

Immature breeding of either heifers or bulls is not believed in, heifers never being bred till they are long yearlings, and bulls not being put into service till two years old. This overcomes stunting of breeding animals, a poor practice with any kind of livestock.

That they believe in using the best sires available is demonstrated by

their purchase last year of two carloads of bulls in the middle west at a cost of \$200 each. All of these bulls were registered and had not been pampered. It is to this latter reason that Robinson Bros. attribute the fact that they were able to turn the entire lot onto the range and keep them there from the time they arrived till the present. After going through a breeding season these bulls were in equally good condition as the native cattle. Because of the general belief that bulls grown on the farm cannot stand the hardships of the range, this experience seems to be valuable.

Where high-priced bulls like these are used, it is natural that they should be kept in service as long as practicable. By segregating the breeding cows from their own sires the use of the 70 bulls on this ranch is only limited by the life of the bulls' breeding qualifications.

Like all California cattle men it is the practice here to market the steers direct from the grass, the one outstanding requirement being that they be sold when fat. Because of this, some are held over and sold as three-year-olds while others are sold as two-year-olds, the weights varying from 1000 to 1700 pounds, according to age.

DAIRY CALF FEEDING.

[Written for Pacific Rural Press.]

Over-feeding the dairy calf is the worst thing you can do, in the estimation of John Belloni, an old and experienced dairyman of Fortuna, Humboldt county.

Like all successful calf raisers, Mr. Belloni believes that judgment is the essential thing in raising a calf and for that reason it is difficult to put on paper any rules that will govern all conditions. His chief advice is to always keep the calf growing.

At the beginning, he feeds whole milk, warm from the cow; and continues with it till he sees that the calf is going along well. This may take a week or several weeks, but in any event it is followed by a gradual diminishing of the whole milk and the adding of skim milk till the calf is finally getting nothing but skim milk. This skim milk is fed warm, direct from the separator.

Just how long this skim milk ration should be fed, again depends upon the condition of the calf. If it is growing well and has begun to partake of pasture, it is weaned at three months; but if it seems backward, it may be fed skim milk another month or two. However long it is fed, either whole or skim milk, it is never given all it will drink at a time, the practice being to keep it always wanting a little more.

Although scouring is exceptional in the Belloni herd, such cases are treated by boiling rice in milk till it is entirely broken down and feeding this with a light ration of fresh warm milk. This is constipating and is a sure cure, according to Mr. Belloni. But it should be followed by careful feeding to be effective, the whole milk ration again being changed gradually to skim milk, rather than to make an abrupt change.

Western American Berkshire Congress

MEETING
Sept. 4

SHOW
Sept. 5 and 6

SALE
Sept. 7

AT STATE FAIR GROUNDS, SACRAMENTO.

BERKSHIRE WEEK ON THE COAST

THE CONGRESS MEETING should draw every Berkshire man on the Pacific Slope. A strong program has been prepared and the discussions will be led by men prominent in Berkshire circles—men who have something to say and know how to say it.

THE CONGRESS SHOW will be the greatest exhibit of Berkshires ever held on the Coast. It will be a wonderful show of Berkshire breeding stock of the highest type and quality.

THE CONGRESS SALE will be an offering of choice selected Berkshire breeding animals. Only good ones, and from the best and most popular blood lines. Consignments to the Sale are from some of the most prominent Berkshire Breeders in the West—A. B. Humphrey, Jos. Wilson, Clark Bros., F. L. Hall, C. M. Talmadge, F. R. Steel, J. L. Thatcher, Hollow Hill Farm, Fontana Land Co., G. A. Murphy, H. L. Murphy, Oak Grove Dairy Farm, and others.

This is an opportunity to get the best for your foundation herd.

Remember the dates, and be there.

J. L. THATCHER,
President.
Western American Berkshire Congress,
Riverside, Cal.

F. R. STEEL,
Secretary.

Grant's Pass, Oregon.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97, Williams, Cal.
"THE NAME GIBSON INSURES QUALITY."

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

Napa Hospital Model Dairy.

[Written for Pacific Rural Press.]

To visit the Napa State Hospital's dairy is, in the writer's opinion, a privilege, because it represents all that is modern in the construction of dairy buildings.

Until recently, this institution, like similar ones owned by the State, paid scant attention to dairy husbandry, the chief requirement being that the dairy shall supply enough milk for the patients and caretakers.

Two years ago the first work of improvement at the Napa institution was started by the purchase of a small herd of registered Holsteins. These as well as the comparatively large herd of grades were cared for in the old dairy barn, till within the past year when the new buildings were completed.

Situated on high land with abundance of drainage, both for the barns and corrals, the buildings were constructed of cement inside and out, a pebble dash being used for the outside finish, which goes a long way toward the beautification scheme.

The milking barn proper has a capacity of 200 cows, there being eight rows of steel stanchions of 25-cow capacity each. Plenty of light and ventilation are supplied through windows along the gabled roofs, each gable covering two strings of cows.

The concrete floors have a gradual slope from one end of the barn to the other, being drained with 14-inch gutters. Gutters and feed alleys are also made of concrete. Along the western end of the barn and running in the opposite direction to the stanchions, a feed and milk passageway furnishes room for the carrier system which is used in transferring feed and milk to and from the building.

This passageway extends through to the feed and silage room adjacent to the milking barn on the north. Here the lower portions of the two concrete silos, located on either side of the feed carrier, are enclosed in the main feed room so that emptying may be done on the concrete floor in all kinds of weather without discomfort.

The milk and washing rooms are located at the front of the milking stable, but under a separate roof. The latter is 18 by 20 feet, equipped with steam for sterilizing; and directly connected with a similar sized airing space for can and utensils.

No Flies on Airing Cans.—This airing space is one of the features of the dairy buildings, being enclosed on two sides by concrete walls and on the other two sides by fly-proof screens. The roof is also made of screen allowing abundance of sunlight and ventilation for the cans and protecting them absolutely from flies.

Modern appliances have been installed in the milk house, the milk passing through a gauze screened funnel and then over a glass-enclosed brine cooler. Separator room, office, test room, refrigerator, and cheese curing room are also located under the main roof of the milk house.

The plant as it stands is not only a model of convenience and beauty, but is sanitary in every respect, the finished product meeting the requirements of certified milk; except that it is not bottled, but transferred to the kitchens in cans.

One hundred and forty cows, mostly Holsteins, are being milked, but the policy as set forth by Owen Duffey, business manager of the institution, will be to dispose of the grades and put the money into purebreds as fast as possible.

DAIRY LAW DEFECTIVE.

[Written for Pacific Rural Press.]

At the request of F. E. Andreason, Sec. State Dairy Bureau, the Attorney General of the State has rendered an opinion relative to his interpretation of the dairy legislation to go into force October 1.

His opinion is that because of the omission of the word butter, the law does not include that product in so far as requiring all cream to be either pasteurized or from tuberculin-tested cows.

He also interprets the law to exempt the grading of market milk and cream, except in cities maintaining an inspection service. If this opinion is upheld by the courts, it means that while all milk for human consumption must either be pasteurized or from tuberculin-tested cows, it need not be sold by grade except in those cities which employ inspectors.

Still another opinion of the Attorney General, rendered at the request of State Veterinarian Chas. Keane, is that the law does not allow the branding of cattle which have passed the tuberculin test to be required, thus making it extremely difficult to identify animals with a clean bill of health.

CALIFORNIA BANKERS TO AID STOCK RAISERS.

[Written for Pacific Rural Press.]

An attempt is to be made by the California State Bankers' Association to encourage the production of more and better livestock in California. Such was the announcement of H. C. Carr, chairman of the Agricultural Committee of the State Bankers' Ass'n at a meeting of the Tulare County Swine Breeders' Ass'n, held at Woodville, Tulare county, August 4.

As a starter of this movement Mr. Carr has agreed to loan money to any boy who lives on a farm in the community adjacent to Porterville with which to purchase a bred purebred gilt of the breed chosen by the boy. These gilts are to be furnished by Mr. Carr at actual cost from the breeder; and will be secured by the boy's personal interest-bearing note, no endorsement from his father being necessary or expected. The feeding of these pigs will come under the supervision of the Pig Club management, but need not necessarily be confined to members of such clubs.

Mr. Carr states that his object is not philanthropic but purely one of good business as he realizes that better breeding, feeding, etc., will result in bigger profits; and that when the farmers of his community become more prosperous, the banks will also become more prosperous. It is his intention to spend considerable time among the bankers of the State in order that this and other plans for improving livestock conditions in the State may be successfully carried out.

The Ideal Green Feed Silo

BECAUSE OF ITS
PROPER DESIGN
BEST MATERIAL and
GOOD WORKMANSHIP

will serve you better than any other. It will give you longer service, a better quality of silage and more profit on the investment than any "cheap" silo. This has been proven by the experience of many farmers who have tried both. In the better silage it will produce the Ideal will save the difference between its cost and that of any inferior silo the first season you use it

and O. I. C. Swine

With our herd will be a number of young Jersey bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. **PRINCE GELSCHER WALKER**, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by **KINTYRE LAIRD**, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality, the herd is unexcelled in the West. At the head of the herd is **BANKER'S BOY**, junior champion and reserve grand champion at P. I. E.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

TEATS GIVE MATTER.

To the Editor: I have a cow which calved about May 5. Within a week, one teat became clogged and since then gives only a half pint or less of watery and stringy corruption. Two more teats have become affected the same way, while only one now furnishes what looks like good milk. We milk all of them clean twice daily, but do not see any more change. She is about seven or eight years old and always gave four or five gallons of milk when fresh. Now there is about half a gallon from the unaffected teat. There is no swelling and there does not appear to be any soreness. Some of my neighbors pronounced the trouble to be garget. A veterinarian to whom it was simply described said tuberculosis.—Mrs. L. A., Meridian.

[This is garget. Give 2 drams potassium iodide twice a day.]

SPOTS ON EYES—SCOURS.

To the Editor: A white spot comes on the eyeballs of several cows. It spreads and the eye waters and seems to go almost blind in two weeks. I have also lost some 2-weeks calves with scours. They have been fed mothers' milk from the start. Weather has been awful warm.—E. H. D., Tulare.

[This is an infectious eye trouble. Place in the eye a few drops twice a day of a solution 25 per cent argyrol. For scours see a dozen answers in the past six months or write to the Cutter Laboratory, Berkeley, for their vaccine.]

COW VERY POOR.

To the Editor: A cow that gave birth to two calves a few weeks ago is very poor and does not give much milk.—J. B., Hanford.

[Have a veterinary examine her. It is possible she did not expel the afterbirth.]

CHICKEN POX.

To the Editor: My hens have chicken pox.—E., Florin.

[The vaccination for chicken pox is successful. The writer is marketing this remedy. And for further information address him.]

HIND LEGS PARALYZED.

To the Editor: Three 50-pound

pigs seem partly paralyzed in their hind legs. Joints are swollen and it is hard to get up. Feeding mostly rolled barley with a little alfalfa.—E. E. R., Burbank.

[This is rheumatism. Give 5 grains each sodium salicylate and formin twice a day and provide dry sleeping quarters.]

NAIL WOUND SWOLLEN.

To the Editor: Have a mare that ran a nail in her foot last winter. It gathered and broke above the hoof, has been painted with iodine, is still swollen and runs sometimes; is quite lame.—T. T. G., Fresno.

[This is a quitter and an operation is necessary for a cure. Consult your veterinarian.]

CHEAP FORMS FOR CONCRETE SILOS.

[Written for Pacific Rural Press.]

That concrete silos can be more cheaply constructed than has ordinarily been the case in this State is evidenced by the experience of A. Haley of Alameda county who constructed two 16x45 silos on his dairy last fall.

It was in making the forms for these silos that Mr. Haley accomplished the greatest saving. He used sectional forms, four feet high and built of rough framing lumber, which were faced with galvanized iron. The outside forms were faced on the inner side with the iron, while those for the inside wall were faced on the front.

There were two of these sections for each form, hinged at each end and connected by an extension section. This latter was fitted with a long extension bolt for the outside form and an expansion bolt for the inside form, enabling the workmen to raise the form for the next section of the silo wall and securely bind it to place by tightening or expanding one of these bolts.

A staff was used in the center of each silo while under construction which supported the inside staging as the walls were being poured. It

also supported the block and tackle for lifting concrete and forms. A horse was used in lifting this material.

By this system very little lumber was required for the two silos, the one set of four-foot forms serving for both silos and still being in good shape for future use.

The Jersey Dorsis Park Lily, owned in New York, produced 16,728 pounds milk containing 957.4 pounds fat; and three months after ending the test, dropped a vigorous heifer calf. The milk, being certified, sold at 20 cents per quart or \$1,556. Valuing her entire grain ration at \$37 per ton, alfalfa hay at \$26 a ton, and silage at \$5 a ton, she netted \$1357 on her milk alone, and her calf is valued at \$2000. The milk profit alone represents 5 per cent interest on \$27,143 valuation.

Good Enough for Any Herd

AGGIE GRACE PONTIAC CREAMELLE
Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Klondyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915. Write or call and see the herd.

SEGIS PONTIAC MEAD.

Included in the 75 head of Holsteins to be sold at his First Annual Sale, Sept. 12, at Fresno, Frank M. Helm will sell his great young herd sire, Segis Pontiac Mead. This bull's sire is a son of Riverside Sadie De Kol Burke which produced 54,808.2 lbs. of milk in two years. His dam is De Kol of Valley Mead 4th who at 28 months produced 20.56 lbs. of

butter in 7 days and 80.865 in 30 De Kol Walker; and is also shrdla days. She is out of the great transmitting cow De Kol of Valley Mead, which is the dam of the new State Record 2-year-old Miss Valley Mead De Kol Walker; and is also a grand-daughter of Aralia De Kol with a record of 28,090 lbs. of milk in one year.

Raising Poultry for Profit

TABLE FOWL CHARACTERISTICS.

[Written for Pacific Rural Press by Susan Swaygood, Pomona.]

An Eastern poultry journal prints a heading, "America's Premier Table Fowl." Somehow, we on this coast never take notice of any one breed, whether it be livestock or birds, until the East takes it up and wants to make a few extra dollars out of us in the far west.

The fowl mentioned in this paper, however, happens to have been with us a long time. Five years ago I saw quite a large flock of them in Los Angeles, and they have been regularly exhibited at all the shows for a longer time than that, without making any great furor. This shows that, either our tastes and ideas on table fowl are not quite like the Easterners', or that these fowl are not just suitable to our climate. They are the "Dark Cornish," and I know they are a very fine table fowl; what I don't know is the reason they do not seem to get a better hold on this coast. For according to Eastern journals the Dark Cornish are not only America's, but the world's premier table fowl. As a strictly market breed, I have no doubt that the Cornish fowl stands high in the East, but out here we seem to want a dual purpose fowl, one that lays a goodly number of marketable eggs and then with a little feeding makes a fair table fowl.

And there is something strange about this, too, because we surely like good things to eat as well as any Easterner; and this is the something I don't understand about it: why our markets make so little difference between a good quality table fowl and a very poor or indifferent one.

Look at the price of Leghorns; there has actually been as little as one and a half cent difference in the price of heavy and light hens the past few weeks. Now that Leghorns are crowding the market prices are changing; in fact, Leghorn men report that their flocks cannot have the usual culling because there is no market at all for their small hens.

Under such a changeable condition, who knows what to raise? Under these conditions who can lay claim to a premier "table" or any other kind of a fowl? If a person raises a few fowls for his own use and wants a real good table fowl, not caring much for quantity of eggs, the Cornish will fill the bill. They are a large bird, deep-chested, with lots of breast meat and little breast bone; the legs are heavy, but the meat on the drumsticks and thighs is good and plentiful too; there is even meat on the back and the wing meat is delicious, but they are not noted layers, hence can not be classed as a dual purpose fowl.

They are allowed the same weight as Orpingtons in the shows, males 10 pounds; hens 8 to 9 pounds, and these are really small for well-bred and well-fed Cornish.

Now the object of this paper is to show the farmers who happen to have a few good laying hens of medium size how they can improve the qual-

ity, and also the quantity, of palatable chicken meat.

The Cornish is a yellow-skinned and yellow legged fowl. These two features influence the eastern markets because they like yellow skinned chicken, while the markets on this coast have never made any difference in choice or price, so far as I know.

Back in England the utility men are great at crossing. They cross the Buff Orpington on the Black Minorca and claim they make a gain both in eggs and meat. The cross is usually a hen of good size, short in shank, long back and body and is usually black with brown spots or brown neck feathers; not an unsightly looking hen as some crosses are, but a neat, rather close-feathered, compact-looking business hen. The meat is white, of course, and fowl of such a cross make excellent layers and weigh a fair number of pounds of palatable meat. Moreover, the cross is much easier to fatten than the straight Minorca; the eggs run from creamy white to a little darker, and they lay well in winter or summer. In crossing two distinct breeds, it should be borne in mind that the male bird must not be too heavy for the hen. I would prefer heavy hens and light males, say a Leghorn male that was long enough for service could be crossed on Orpington hens or on Cornish for that matter. When the male from a breed laying white eggs is crossed on a breed that lays brown eggs the tendency will be towards white, but they will usually be of a creamy white.

Some of the best egg records, of late, have come from pens made up of birds so crossed. And while I favor pure breeds for myself, I know there is much to be learned yet that may help towards making better dual purpose fowl for California.

As a rule, we have smaller acreage than the Easterners, and we expect more from an acre of land that they do from several acres. That may be the reason our breeders take up with the small breeds; they can certainly crowd more of them on an acre.

Last winter I was on a poultry plant where three thousand Leghorn hens ran in one yard. There were five good poultry houses and the hens distributed themselves very evenly in the houses; when it rained in the early morning we kept the hens confined in the houses until the rain stopped. Sometimes they were kept in three days without a run, but they had plenty of litter to scratch in; plenty of food and water, and they did shell out the eggs to beat everything. I spent five months on that farm, working every day among the poultry from daylight until dark. We had no epidemics of any kind until March we got a few cases of roup, and with all those hens running together it took good management and hard work to stamp it out.

That is the greatest trouble in having such a number of fowls together: it is so hard to detect every case and segregate it before the disease has been passed on to several others.

Layers' Mash.—Is the following mash all right for Leghorns and

Rhode Island Reds—a laying mash?—E. E. V.

Bran, 200 lbs.; barley meal, 100 lbs.; middlings, 100 lbs.; alfalfa meal, 50 lbs.; bone meal, 25 lbs.; Soy bean meal, 25 lbs.; salt, 5 lbs.; beef scrap, 50 lbs.; fish meal, 50 lbs.

[Add 100 lbs. corn meal, and 5 lbs. charcoal to your list, which will make a very fair laying mash.]

VALUE OF WHOLE MILK FOR CHICKENS, PIGS, ETC.

To the Editor: What is the feeding value of whole milk (5 per cent butterfat) for feeding chickens, pigs, etc.? Can I get 16c a gallon out of my milk when fed to chickens or pigs? Prices on feeds—bran, \$30 a ton; best beef scraps, \$3.25 cwt.; grain, \$30 a ton.—L. B. R., El Cajon.

[Answered by E. C. Voorhies, University Farm, Davis, California.]

[Whole milk is not worth 16c a gallon when fed to chickens or pigs. It is impossible to get this return from feeding 5 per cent milk. The only time whole milk should be fed, is to young calves up to 4 or 5 weeks old. Experiments have shown that skim milk is nearly as valuable as whole milk for feeding calves and pigs. In fact, some of the experimental work has shown that skim milk gives better results than whole milk. When properly fed, skim milk has a value of 20 to 25c cwt. It will often replace, when fed in the right combination, 500 to 600 pounds of grain. With hogs, it is usually fed in the combination of 1 part of grain to 3 or 3½ pounds of skim milk, or if this amount is not available, it will give just as economical results when fed in a smaller quantity.]

Napa county Livestock Ass'n met Aug. 5 to hear addresses on "Marketing" by D. O. Lively, and "Diseases" by County Veterinarian Dr. Dederick.

It is expected that the premium list of the Kings County Fair will be ready for mailing by August 15. We are advised that every effort will be made to stage the biggest and best livestock show ever held there and it is expected that many show herds from the northern part of the State will be entered.

PACIFIC RURAL PRESS, PUBLISHERS

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

The difference between a well- and poorly-dressed woman is many times not so much a matter of clothes as it is the care of them. If in addition to accumulating a wardrobe, we could all indulge in quantities of dry cleaning, our troubles would be at an end, but most of us must be our own dry cleaner and to be able to do it well is quite an achievement.

Gasoline and Spanish bark are the two standbys for home cleaning, while French chalk and Fuller's earth are used for laces and fine articles.

In regard to the use of gasoline, remember that it is an inflammable fluid and should be used carefully. Use it always in the open air and do not take an article that even has gasoline fumes about it into a room with a fire or put it into a closet where some one may enter with a lighted match. Many serious household fires are due to carelessness in the handling of gasoline.

To clean a soiled blouse, fill a good-sized bowl with gasoline and put the article to soak, afterward rinsing it up and down. Shake well and hang out to dry and air. Do not press until entirely free from odor.

As you no doubt have found out by sad experience, gasoline will not remove all spots and many times after a garment has had a gasoline bath, it must be sponged with a cloth dampened in water.

For school garments or every-day skirts, nothing is better than Spanish bark. Spread the garment to be sponged on the table and to a bowl of warm water add a bag of Spanish bark and a teaspoon of ammonia. Sponge the garment thoroughly and after wiping dry, press well.

For light articles, such as a baby's coat, hot cornmeal is very satisfactory—cover the article well and rub into every part of the garment. Shake out and rub in a fresh supply and put away in a covered box for a day or two. When the second application of meal is shaken out, you will find the garment wonderfully freshened.

Use this same process with French chalk for laces and delicate fabrics and do not forget to put the article away for a day or two.

Spats and hats that are fawn colored should be cleaned with Fuller's earth and put away that the powder may do its work.

Clean your gloves on your hands with gasoline and cornmeal and wipe dry before taking off to air.

If you have a white straw hat that needs cleaning, if a Panama, use a paste of cornmeal and gasoline; or if a leghorn, follow this up with a peroxide bath. Feathers clean beautifully by dipping them well in clean gasoline and drying thoroughly.

If you have white furs that need freshening, dampen them well with pure alcohol and then sift in white talcum and put away to dry. When the powder is shaken out, the dirt will come with it.

When possible, do your cleaning on a bright day—the odors seem to be easier to dissipate, and they linger long enough at best.

PEACH AND PINEAPPLE JAM.

Use equal parts of both fruits and to every pound of fruit allow three-quarters of a pound of sugar. Peel and cut up the peaches, peel the pine-apple and cut into small pieces. To every two pounds of the jam mixture, use the juice of one lemon. Arrange the fruit and sugar in layers, having the sugar on top. Let stand for a while to draw the juice. Then set over the heat and let come to a boil. Then take from the stove and let stand over night. Next day, cook until as thick as desired and put in jelly glasses and cover.

And let me remind you once more of the necessity of care in using gasoline.
Rosabella Best.

FIRST AID.

At this time of the year when people go off for vacations in the high Sierras, tramping and living in small parties, everybody should know how to resuscitate a drowning person. Cramps from the cold water, hidden incumbrances of vines or roots of trees in pools often hinder even a good swimmer and one of self-possession, so that before help reaches him he is drowned. But often, even though all signs of life are absent, if the patient is worked over immediately, he may be restored to life. The correct method of resuscitation from drowning which is taught in the New York schools and many universities is called the Prone Pressure method. It is simple and should be memorized. It does not require great physical strength but a level head and consistent work.

First, the drowned individual should be held so that as much water as can, will run from the mouth and nostrils. Then he should be laid flat on his stomach, head turned to the side and a little lower than his feet. Then straddle him, a knee on either side slightly above his waist line. Then with the hands outstretched, the thumbs on each side of the backbone in the middle of his back, press down firmly and count 1-2, then lift and count 1-2. Then press for the second time 1-2. The counts should be slow—make them very slow, for in time of excitement, one tends to rush and here a hurried pressure would not accomplish the desired result.

With this alternate pressure and rest, the resuscitator is not worn out and can work for an hour if necessary, and the result which is desired, that of pressing the water from the lungs and giving a regular, slow movement to them, which will aid them to take on their normal work, will be accomplished.

BOWLS OF FLOWERS.

One of the big china stores is showing a new line of bowls for flowers. They are made very flaring and come in many colors and shades with a heavy glass frog of the same color in which to place the stems. One exceedingly pretty one was of bright blue with a bouquet of pink dahlias in it.

COOKING TEPARY BEANS.

Editor Home Circle: We have found that Tepary beans are much improved if soaked over night, before cooking. They are good cooked with tomato, onion, a little red pepper and a few slices of bacon.—Mrs. R., Oakdale.

PREVENTION OF TYPHOID.

The control of typhoid fever should be of particular interest to country people, as statistics show us that in most of the states, seventy-five per cent of the cases occur in the country and small villages.

City people are less liable to the disease because city officials pass upon the purity of both milk and water and typhoid is a disease that is only contracted through either what you eat or drink.

Every farm should have a water supply that cannot become contaminated and a sanitary disposal of waste including that from the human body.

If there should be a typhoid patient in the house, remember that the element of contagion is in the body discharges and these after being disinfected should be buried. All linen should be disinfected in a chloride of lime solution and all dishes kept apart from the ones used by the family.

When the case is over, the room and all its contents must be thoroughly disinfected and aired.

Vaccination against typhoid is recommended strongly and it is hoped it will prove to be as effective a help as that of small pox vaccination.

WOUNDS FROM RUSTY NAILS.

When a rusty nail enters the flesh, every effort should be made to keep the wound bleeding freely. This can be accomplished by striking and jarring the injured parts. After that, nothing is better than bathing in turpentine and if possible, rest the injured part in a bowl of turpentine. If the wound bleeds freely and the turpentine is applied and then the wound wrapped to protect it from dirt, there is very little danger from bad after-effects.

LAUNDRY HINTS.

Starch made a very deep blue by the use of bluing should be used for navy prints and linens.

A spoonful of ox-gall in a gallon of water will set the colors of almost any goods. Soak well before washing.

Soap, starch and salt should be rubbed into spots of mildew on cloth and then the article placed in the sun for an hour.

Sprinkle clothes with a whisk broom and warm water, or use a bottle which has been fitted with a sprinkler top.

All fine needlework should be ironed on the wrong side on a heavy piece of flannel, and should be ironed thoroughly dry.

For fruit or coffee stains, pour boiling water through the cloth. Repeat, if necessary.

REFRESHING DRINKS.

Egg Lemonade.—Put into a glass the juice of 1 lemon, 1 whole egg (or only the white), 3 tablespoonfuls sugar and fill it up almost full of water. Pour all into a fruit jar. Screw up tight and shake hard for a few seconds until it foams. The egg may be beaten separately and then added to the fruit juice, water and sugar, instead of shaking the entire mixture. Pour into a glass and serve cold.

Mint Fizzle.—Cut the rind of 1 lemon very thin, then into small strips. Squeeze juice of half a lemon in each glass, add 1 teaspoonful of sugar and stir until dissolved. Then fill halfway up with shaved ice. Pour in half ginger ale and half grape juice. Place 3 sprigs mint and a few pieces of peel in each glass. Serve with straws.

Cherry Cocktail.—Mix together 2 cupfuls of canned cherries, 2 cups spiced or canned currants and $\frac{1}{2}$ cup orange juice. Add sugar as needed. Chill and serve in small glasses garnished with sprigs of mint.

BAKED BEEKSTEAK PUD- DING.

Ingredients.—6 oz. flour, 2 eggs; not quite a pint of milk, salt to taste, $1\frac{1}{2}$ lb. steak, 1 kidney, pepper and salt.

Mode.—Cut the steak—which must be tender—into nice square pieces, and the kidney into small pieces. Make a batter of flour, eggs and milk in the above proportion, lay a little of it at the bottom of a pie dish; then put in the steak and kidney which should be well seasoned with pepper and salt, and pour over the remainder of the batter and bake for $1\frac{1}{2}$ hour in a brisk but not fierce oven.

Meat Pie Made from Left Overs.

Mince, or cut into cubes, meat of any kind—roast, broiled, or anything, season well with pepper, salt, onions, mushrooms, etc., and moisten well with rich brown sauce or gravy. Line dish with mashed potato, fill with meat mixture, cover with crust of mashed potato about $\frac{3}{4}$ inch thick and with bits of butter around the top. Bake to golden brown and serve in same dish it was baked in—with creamed celery or oyster or tomato sauce.

Mrs. A. S., Los Angeles.

PEAR SALAD.

A delicious, refreshing salad is made of pears, pared, halved and cored. Place two halves on a crisp bed of lettuce, then top with a generous dash of mayonnaise and a sprinkle of cayenne and you will have a delightful, cooling salad for a hot day. The family will enjoy it and it is an ideal warm weather salad for a company dinner.

LIGHTING FIXTURES.

If you are contemplating any changes in your lighting arrangements, do not fail to investigate the new indirect lighting fixtures. In these, the light is thrown up and reflected back and the effect is much softer and more attractive than in the old way.

If You Have Any Furniture whatever to Buy, be sure You Get it NOW--- at Barker Bros.

BUILDING BLOCKS.

When Bobby has the building blocks,
A battery he rears,
And then such thundering cannon shocks
And firing as one hears!
The dollies shiver in their socks
When Bobby has the building blocks.

When Barbara has the blocks, we know
A bake-shop we shall see,
With bun and biscuit, row on row;
The dollies all must be
In apron clad and kitchen frocks
When Barbara has the building blocks.

When Benny has the blocks, be sure
He'll play at engineer,
With railroad trains in miniature;
The dollies all appear
As tourists now, with bag and box
When Benny has the building blocks.

When Baby Betty has the blocks,
A bed we always spy.
Away with cannons, cups, and crocks,
And choo-choo cars—"Bye Bye."
Her darlings all to sleep she rocks
When Baby Betty has the blocks.
—Rose Mills Powers, in the Pilgrim.

VIOLET'S TOOTH.

Violet was getting ready for school with tears in her eyes and distress in her heart. The family all looked troubled too. And the cause of it was Violet's tooth,—a tiny tooth so loose that it was held in place only by a wee thread, but she could not get up the courage to have it taken out.

Papa and mamma had tried to buy the privilege of taking it out. They had offered a new doll-carriage and countless other things dear to Violet's heart, but she could not bear to even open her mouth.

So she started off for school, a forlorn little figure with her burden of of sorrow, so small to grown-up folks, but so real and heavy to little ones.

"Miss Carey will be sorry for me," thought poor Violet. "I'll tell her first, as soon as I get to school."

Now Miss Carey was the nicest kind of a teacher. Sometimes she could find a way out of troubles when even mothers had given up.

It was a very sad, tear-stained little face that Violet lifted to Miss Carey. "Oh, teacher, I've got a loose tooth," she said.

"Let me see it, dear," said she, taking Violet on her lap. "Why, Violet, it's the cutest little tooth! And you haven't even seen it! Wait just a minute, and I'll get it for you." And in an instant Miss Carey was holding it up in her fingers.

"Isn't it cunning?" went on the teacher, opening her desk. "I'll wrap it up in this silver paper, and after it teaches us a lesson this morning you shall take it home in this little round box."

How interesting it seemed! Violet felt quite grand that her tooth was so important.

After school began, Miss Carey held up the tiny tooth and told a funny story of the little white workers who live in a red prison, and how they want to get out and make room for bigger ones.

At noon Violet hurried home with her box, eager to tell how her tooth had "helped to teach school."

"Why, why were you brave enough to let Miss Carey pull it out when you didn't want me to touch it?" said mamma.

Violet looked puzzled.

"Why, she did pull it out, didn't she?" she said slowly. "I never thought of that. Miss Carey said it

Cook in a cool Kitchen

All the heat is concentrated where it is needed—keeps you cool and makes for better cooking

NEW PERFECTION OIL COOK-STOVE

Why not cook with a modern oil stove this summer and be comfortable? Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate.

Better cooking because the long blue chimneys give steadier, more evenly distributed heat, under perfect control—like gas. No smoke or smell. In 1, 2, 3 and 4-burner sizes, ovens separate. Also cabinet models with Fireless Cooking Ovens.

Choice feed, ctl. ... 1.47 1/2 @1.52 1/2

Oats.

The feed movement is normal, but seed oats, for which there is some inquiry, are scarce and high. Blacks have been marked up, some Texas reds offered at stiff prices.

[f. o. b. San Francisco.]

Red feed\$1.65 @1.75
Red seed 1.80 @1.90
White 1.62 1/2 @1.65
Black seed 3.00 @3.25
Texas Red seed 2.10 @2.25

Corn.

The Eastern market continues on up grade, and local figures on Eastern yellow have been put up. This is reflected in a little advance in the top figure for Egyptian, first-class stock being in light supply.

[f. o. b. San Francisco.]

Eastern Yellow, ctl...\$1.97 1/2 @2.00
Milo Maize 1.55 @1.65
Egyptian 1.70 @1.80

Beans.

The advance earlier in the summer was more than the market could stand, and there has been more or less weakness since. Stocks are well cleaned up, and there are still occasional purchases, but only of a small jobbing nature, the tendency is downward. Large and small whites, pinks, bayos, blackeyes and lima beans are all lower this week, and it is doubtful if the present prices will hold, as they are still high. While it will be some time before new beans are offered, consumption has been curtailed that the supply will last through the season.

[On wharf, San Francisco.]

Bayos, per ctl.\$5.50 @5.60
Blackeyes 3.25 @3.50
Cranberry beans 5.50 @5.60
Horse beans 3.25 @3.40
Small Whites (south) ..7.00 @10.00
Large Whites 7.00 @8.00
Pinks 6.00 @6.15
Limas (south) 5.65 @5.75
Red Kidney 8.00
Mexican Reds 5.50 @5.60
Tepary beans 4.50 @4.75

Seeds.

Offers of 7c are reported for brown mustard in Lumpoc district, supplies on hand being light, with strong demand. Otherwise nothing doing in seeds, as dealers have nothing to offer for cover crops before Sept. 1, when new prices will be made. A little new alfalfa is being offered at 20 to 21c to dealers.

Hay.

While cars are short, local demands have caused heavier shipment to this market by water, bringing enough to meet all requirements. Arrivals of fancy wheat hay limited, and sell at high prices; no fancy red oat hay appearing. Alfalfa coming in freely, but well taken at range quoted. Country offerings appear to be held firmly, in some parts of the interior there is an active demand. The Government is in the market for 8,000 tons of hay for Philippines.

[Carload lots, per ton, San Francisco track.]

Wheat, No. 1\$13.00 @14.50

Deciduous Fruits.

The local market is fairly supplied in most lines, prices rather easy as compared with those paid on Eastern shipments; something of the firmness in outside markets reflected here. Huckleberries offered freely, with declining prices. Logan, black and raspberries in lighter supply and higher; strawberries are lower, and clean up slowly. No quotable change in apples, which continue active for shipment, notwithstanding the impossibility of shipping to many markets where good demand exists. Extreme prices recently paid for shipping pears has brought some advance in No. 1 Bartlett locally, but off-grade and ripe stock is plentiful and hard to move, even at easy prices. Peaches in lugs doing somewhat better, some fine lots of Elbertas being well received, basket stock is only steady. The best black figs find strong market at good prices, but Brunswick variety finds little favor. Plums in liberal supply, and nothing brings over \$1. Nectarines continue to move well at satisfactory prices. Cantaloupes rather a drug on the market, though low prices bring considerably more demand. Watermelons steady, with liberal movement. Grapes about as before, little increase in receipts.

[Wholesale prices, San Francisco.]

Dried Fruits.

New prices to the trade are expected from the peach growers' association before the end of the week. Local market shows little feature, and packers say market is extremely dull, with Eastern buyers unwilling to make further provision for future needs at present range of prices. Local buyers also taking very cautious attitude, and pay little attention to country offerings unless they get bargains, which does not often happen. While growers generally

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., August 7, 1916. During the past week the demand for California deciduous fruits has far exceeded the supply, though shipments have been fairly liberal. In fact this condition has prevailed practically throughout the season.

Pears from hill districts are moving in heavy supply, but the Valley is practically cleaned up.

There are a few cars of peaches moving, mostly loaded in assortments of what few plums are left and pears.

The trade does not seem to be critical with regard to assortments and most anything in the shape of fruit, provided it passes inspection, is being bought at extremely high prices.

All auction markets ruled higher this past week than any time since the opening of the season, the high market being reached on Thursday by an assorted car of deciduous fruit from Loomis that sold in New York for \$2063.00, clings averaging \$1.90, some selling as high as \$2.25.

There is practically little or no competition in the East and the effect of Eastern shipments will not be felt for two weeks. Consequent-

ly California will have a clear field throughout the month of August.

Malagas and Thompson Seedless from the Fresno, Livingston and Atwater districts are moving and the quality of both varieties is exceptionally fine.

Tokays from Winters and Vacaville are of good color, size and quality. The heavy movement, however, will not begin for ten days. We look for an unusually good market on grapes throughout the season.

The following prices have ruled for the week:

New York.—Bartlett pears averaged \$2.97; Elberta peaches, 95c; Tuscan, 91c; Crawford cling, 95c; Duke plums, \$1.60; Gross, \$1.60; Giant, \$1.40; Hungarian, \$1.57; Wickson, \$1.46; Kelsey, \$1.55; Tokay grapes, \$3.50; Thompson Seedless, \$2.03.

Chicago.—Bartlett pears, \$2.68; Crawford peaches, 77c; Elberta, 86c; Grand Duke plums, \$1.86; Gross, \$1.71; Giant, \$1.62; Kelsey, \$1.50; Wickson, \$1.76; Hungarian, \$1.68; Thompson Seedless, \$1.83; Malagas, \$2.35.

Total shipments to Aug. 8th, 6900 cars; total shipments same date 1915, 5287 cars.

Special Livestock Market Report.

San Francisco, Aug. 9th.

Livestock markets have more life than for several weeks. If a railroad strike comes on, things will be interesting, though at least one big company counts on using river transportation for what supplies they will need above their present stocks of meat.

Hogs are dropping, due to the pressure of stubble-fed stock. This is of much better quality than the dairy-fed stock which has been coming all summer. The latter is being sidestepped wherever stubble hogs are available. One California hog raiser delivered 12 carloads to one

company this morning.

Grain-fed cattle are coming, but most receipts are grass-fed.

Sheep are arriving and en route from Oregon. One packer has received within the past two weeks and has on the train now, about 40,000 yearlings to three-year-olds.

Wool market is very quiet and concessions are necessary to effect sales. Boston mills and warehouses are stocked full up. Fall wools are being shorn in California, but there is practically no demand for this short seedy staple which will probably go lower than last year before it is moved.

are holding together well, there are some anxious to sell, and as a result top figure on apricots has again been shaded a little. Old prunes are easier. Holders are anxious to clean up before new crop comes in. Figs remain firm, with serious shortage of supplies; peaches are firm. Very little doing in new apples or pears, old stock is pretty well cleaned up. [Net to growers, f. o. b. shipping point.]

Apples, new crop	6 c

Citrus Fruits.

The Eastern auctions show higher prices for oranges and lemons. Shipments from California are averaging about 75 cars of oranges and 25 cars of lemons daily. The Valencia shipments are estimated to reach 13,000 cars this season, with from 4,000 to 5,000 cars yet to go.

At New York on Monday, Aug. 7, the auctions averaged \$3.30 to \$4.70 per box for valencias, and for lemons \$6.65 to \$6.80 per box. Other auction points paid about the same prices that day.

Indications point to a very heavy crop of oranges in California next season.

Prices remain firm at recent advance, corresponding to values at shipping points. The local demand in San Francisco has been light for past week, but movement is normal for this time of year.

Oranges, Valencia, fancy	
box	\$3.40 @ 3.75

RANCHERS' SAN DIEGO MARKET.

At the first bi-monthly meeting of the "Ranchers' Market of San Diego County" held in San Diego Saturday, August 5, the principal feature of the program was an address by Prof. S. S. Rogers of the State University on "Growing Vegetables for Market in California," he also joining others in a general discussion of vegetable marketing in this section. Fifty members and other producers were present.

The Ranchers' Market of San Diego County is not a retail market but a co-operative, wholesale selling association that has been organized, incorporated, controlled, and offered entirely by ranchers of the county who have faith in the effectiveness of real, thorough co-operation. It handles all kinds of vegetables, deciduous and citrus fruits on the local market; and ships to brokers and other distributors in

outside markets, all produce that will bring greater returns elsewhere. All its members are now making large plantings of winter tomatoes, peppers, egg-plant, etc., and will later put in a considerable acreage of cabbage, cauliflower, celery, peas, beans, and lettuce for the winter shipping business, thus making the best possible use of a portion of their fine, frostless garden land.

The Stanislaus Livestock Show and Exposition will offer \$2000 in livestock premiums. It will also include a fashion show, baby show, poultry show and automobile show. The supervisors appropriated \$1000, the city council \$250, and Modesto business men \$1425.

Publisher's Department

The time of year is approaching when fall work in the garden will be necessary. In order that your efforts may be most productive you should have a copy of either "California Vegetables" or "California Flowers" by Prof. Wickson. See adv. in another column.

The next issue of the Rural Press will be devoted largely to the tractor, its growth and uses. Prof. Wickson will review the growth of the idea and special articles will cover the various uses now made of them.

In view of the new "Rural Credits" law just passed, the book "Federal Farm Loan System" by Herbert Myrick, received this week, will be of special interest. This book contains 240 pages of practical matter covering the new method of farm mortgage finance under national supervision. Published by the Orange Judd Co., 315 Fourth Ave., New York. Price \$1.00.

E. L. Owen of San Diego writes us that "I find much that is helpful along marketing lines in the Rural Press, and wish that every one of our members and every member of the County Farm Bureau could be induced to take it and enjoy that help."

Many Eastern farm papers have raised their subscription and advertising rates to meet the higher cost of white paper. The Rural Press will not raise its rates on that account. We do not like to use print paper and will change back to book as quickly as possible.

California's Thirst for Tractors.

Eleventh of a series of sketches in which the Editor presents suggestions, drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

IT IS not strange that California has at this day a consuming thirst for tractors. It would be strange otherwise, for the desire for something better than horse or mule power to do heavy farm work burned in the hearts of the pioneers.

In an address at the California State Fair of 1857, Henry Eno said:

ments of independence and of every species of greatness. All its diversified aspects invite industry and intelligence to lay open its boundless stores of wealth. The very act of decomposing the rock to prepare the foundation of a productive soil has distributed a precious medium of commercial intercourse throughout the surface of the highlands and the beds of the streams and exposed it to the easy access of toil as a stimulus to all sorts of enterprise. The broad and prolific valleys of the land have gone through their pastoral epoch and their deep and alluvial bottoms are inviting enlightened husbandry to unfold their exhaustless treasures. No dense forests cover the earth to retard the plowman, but an open, boundless fallow allures him to turn its surface and to plant a hundred golden hopes with every grain of golden seed. The mountains send up cedars so many fathoms high as though to remind us of the gigantic productions of the ancient ages, while the valleys give nourishment of roots, cereals and succulent vines whose yields would appear fabulous did we not see substantial evidence of their extraordinary growth and plenteousness. A million flowers announce with a million voices that the fullness of time has arrived when the human soul shall accept the silent and sweet revelations of nature.

Thus was the pioneer exhorted to match the largeness of the land with the largeness of his thought and he was amply ready to escape from memory of the littleness of Eastern farming; the stone piles, the continued whaling of tired teams; the exhausting swing of the "grain cradle" and the monotonous pounding of the flail on the barn floor—which still prevailed in that day. And then gold was the world's greatest material thing and California was illimitable greatness in plain and mountain and lay beside the greatest ocean. Surely California farming should also be great and new in the capacity of its farming appliances.

Conditions and Requirements.

—Conditions were favorable for meeting requirements. Contact with the mining industry fostered familiarity with the idea of capacity in machinery and the re-

C. L. Best Tracklayer Harvesting and Threshing 18 Feet of Grain per Swath.

moving wagons, propelled by animal power, but at railroad speed; and some other than muscular force will prepare the ground to receive the seed.

Thus early did the yearning for an overland railway, to reduce weariness and increase speed of travel, associate itself with a yearning for machinery to multiply the power of a man in doing farm work.

Why did pioneers dream so early of the grandly capable in farm machinery? Why, when horses could be had for the catching, when forage was horse-high all over the plains during the rainy season, when all fuel for steaming was scarce and high-priced, because the State had no coal and had then discovered no oil, did they yearn for steam wagons, plows, harrows and threshing machinery?

Longing for Largeness.—It was the primal impulse of the pioneer to do something which would embody the greatness of his opportunity. It mattered not what line of activity he chose, he must be active largely. Dr. C. F. Winslow, when he was invited to address the California legislature of 1854, voiced the impulse of the pioneers in these words:

Within California's bosom exist the permanent and inexhaustible ele-

The Yuba Ball Tread Doesn't Mind Pulling Stumps as Fast as You Can Hitch onto Them. Lots Easier than Grubbing.

quirements of mining created foundries and machine shops in all the pioneer towns and filled them with machinists and inventors. All communities became accustomed to the recourse to machinery as a community arising purely on a farming basis could neither conceive nor have means of realizing. As mining lost its first rush, local inventors and

Why This Tractor Wins At The Shows And On Thousands Of Farms!

One Man Plows 10 Acres a Day.

One Man Drills 50 Acres a Day.

One Man Mows 36 Acres a Day.

The success of the Bates Steel Mule at every important tractor demonstration held in the last two years is due to these definite facts: *It is the only real one-man machine built—every farmer can do more different jobs with it more days a year than any other tractor—it will work on any soil, wet or dry, without packing the ground and its price is low for the big service rendered.*

One Man Harrows 40 Acres a Day.

One Man Discs 35 Acres a Day.

One Man Cultivates 31 Acres a Day.

The Bates Steel Mule

FULLY COVERED BY PATENTS

gives you big pulling P-O-W-E-R all the time regardless of soil conditions. We use a "Crawler" instead of a wheel because the ground surface varies so much that a wheel "slips"—loses traction—which means loss of power—and power at the drawbar is the thing you *must* have.

One lug on a drive wheel tractor may pull 3,000 pounds on hard ground, but a soft spot may need two lugs; a sandy spot four; a wet spot, eight. With only *one* lug pulling on hard ground a drive wheel tractor may pull 3,000 lbs.; on a sandy spot, 800 lbs.; and on a wet spot,

only 400 lbs.—giving an average pull of 1,400 instead of 3,000 lbs. average pull with as it would with a Crawler Tractor.

The Crawler has enough lugs on the ground to deliver its power under all working conditions. No matter if it needs *one* or *ten* lugs, the Crawler of the Bates Steel Mule is able to meet the emergency. The *high average pull* is what makes the Bates Steel Mule one

of the most popular light tractors made and why the friends of thousands of satisfied owners are ordering Bates Steel Mules for themselves.

Tractors at the State Fair.

[Written for Pacific Rural Press.]

PARADE of all tractors will pass the grandstand at the State Fair at 9:30 a. m., September 4. They will at once take their allotted places on the demonstration ground, and at 10 a. m. will conduct a public demonstration of plowing until 1 p. m. From 3 to 5 p. m. every day thereafter, as arranged by each manufacturer, demonstrations of hundredfold uses to which tractors may be put on the farm, will be held. Every tractor at the first demonstration will be different from the rest, and no more than two of each make are allowed.

Tractor demonstrations are becoming more and more recognized all over America as the best way for one who wants mechanical power on his farm, to compare the merits of the various types and makes of tractors. At demonstrations, as nowhere else, the largest number of types are seen doing similar work under similar conditions. The attendants are paid to answer all the fool questions or others which anyone wants to ask. The tractor that won't stand most thorough investigation should be rejected.

The multitude of uses to which a tractor may be put, including their use as stationary engines, should be demonstrated at this State Fair. We have letters showing that certain people think the tractor is for large farms only. That is

because they do not know how busy a small tractor can be kept at various jobs about the farm. If it can't be kept busy a reasonable number of days through the year, don't buy it. But first find out how many more uses it is good for than you dreamed of. You can do this more thoroughly at less expense and time at the State Fair, or other big demonstration, than by any other means. A curious example of a tractor user, overlooking an important use for his machine, has recently come to our notice. He keeps six horses through the whole year, principally to seed his grain, though

we know of tractors seeding grain with entire satisfaction. Use of the tractor for pumping, wood-sawing, silo filling, alfalfa chopping, concrete mixing, etc., saves separate engines for each of these operations and many others.

State Fair Tractor Entries.—Entries do not close until August 25, so we can give only a partial list of those who will take part in the demonstration and have entries in the Fair Exhibit.

Holt Caterpillars.—The Holt Manufacturing Company will have three Caterpillars of 75, 45, and 18 h.p., respectively, a self-propelled harvester, a regular standard harvester, a Grant combination bean and grain harvester, a light Caterpillar disk plow and two heavy ones, and a 10-foot double-disk harrow. Besides these, they will display a cut-out Caterpillar, showing all the working parts similar to the machine they had at the P. P. I. E. Various sized Caterpillars will climb a 45-degree wooden incline.

Big Bulls.—As the Big Bull factory specializes on one size only, they will have only one tractor at the Fair. The Big Bull tractor is rated 7 h.p. on the drawbar and 20 h.p. on the belt. However, at a recent test at one of the Eastern tractor demonstrations, the Big Bull is reported to have developed a drawbar pull of 14 h.p., double what is claimed by the manufacturers. This test was made with the new dynamometer scale developed by the Hyatt Roller Bearing Co., which has been used to such a great extent

at the last three or four big demonstrations in the East. The tractor on which this test was taken was pulling three 14-inch plows and was burning kerosene.

Yuba Ball Tread.—The Yuba Construction Co. will exhibit their Model 12 and Model 18 tractor at the State Fair. On September 4 they will pull the new Yuba plow in the plowing demonstration. We have a picture of the 18 pulling two 4-row Ventura bean planters with a marker attached and a harrow behind. This outfit was being used on Chew Mock's bean land near Kirkville, Sutter County. So far as we know, this is the largest number of rows of beans that have ever been planted at one time.

Samson Sieve Grip.—The Samson Iron Works will exhibit three tractors, a "six-twelve" size, a "ten-twenty-five" size for exhibition, or show purposes, and another "ten-twenty-five," to be used for the demonstrations. The intentions are that it will operate such implements as implement dealers are arranging to furnish for to use during the Fair week, and there will be quite a variety.

C. L. Best Tracklayers.—The C. L. Best Traction Co. will have one each of all their machines at the Fair. These include 75 and 30 h. p. models, which will be used chiefly to demonstrate plowing and harrowing at the Fair.

Sandusky Tractors.—There will be a Sandusky round-wheel tractor in the demonstration to pit itself against all comers, and prove that the

round wheel is able to do the work required. It develops 15 h.p. on the drawbar and 35 h.p. as a stationary engine.

Bates Steel Mules.—To sit on the plow and control a tractor at long range is not the common way in California, but it comes nearer the way farmers are accustomed to work. It enables one to watch the plowing without an extra man and without straining his neck. Its traction is applied on a revolving track. The engine develops 30 h.p. These "Steel Mules" are entered both in the State Fair demonstration and in the Los Angeles Traction Engine and Implement Dealers' Association

Big Bull Orchard Tractor Works Up to the Trees with Double Disks and Leaves a Fine Soil Muleh.

at Puente, from September 19 to 23, and deserve careful study.

If your neighbors have told you that repairs cost more than they expected, put it up to the representatives of his machine to explain the trouble, and ask them how to avoid it yourself. Get an idea of how the power is transmitted from motor to drive wheels in the different makes, and find out whether track types are better suited to your conditions than wheel types or not.

Come to Ask Questions.—Our readers tell us that in buying tractors, flexibility in handling, accessibility of wearing parts, economical transmission of power, and general excellence of material are among the most important features to look for. Accessories for burning cheaper oils, keeping dust out of wearing parts, etc., will also invite inspection. Come and see the "critters" at work, and bring a note book full of questions to ask the drivers. Take notes on each machine, so you won't become confused when you go back home. Look at the farm implements, built especially, for tractors, and take notes on them. Ask the agents if you can use your old plows, seeders, etc. Ask them how many days a tractor will work if carefully handled, before it must be replaced. Get prices, but remember that suitability for your conditions will be remembered long after the price is forgotten.

Desirable Tractor Qualifications.

[Written for Pacific Rural Press by R. Tomkinson.]

In the days of horse power a large part of the land that should have been in cultivation was left untouched especially when the rains stayed late because in the short time left to do the plowing the horses were unable to get over the full acreage, consequently the yield of the ranch was not as large in those days as it is now, nor were the profits. Statistics show that for his own feed the horse used 25 per cent of all the cultivated land in the United States; and on a yearly average works but three hours per day—that it costs over \$120 per year to keep him.

The development of the tractor industry has never ceased. Steadily each year the number of tractor manufacturers have increased until at present there are over a hundred different machines on the market, all the way from the little 2 h.p. that leads a cultivator between the rows, to the big 90 h.p. track-laying tractor that tears the earth up by the root or hauls a long string of ore laden trailers through the desert and over the mountain.

Should Work 75 Days.—The ideal tractor must be an all-duty machine, whether it be an 8 h.p. or a 90 h.p.—it must be a profitable investment first, because the owner should have the use of his tractor at least 75 full working days during the year as follows:

- (1) Preparing the seed bed, plowing, harrowing, disking, and rolling.
- (2) Where a small tractor is used: Drilling and cultivating.
- (3) Harvesting.

(4) Belt works: Threshing, shelling, grinding, cutting, baling, sawing.

(5) Road work: Hauling crops to market, road grading, dragging.

(6.) Miscellaneous: Clearing land, pulling stumps, moving buildings, etc.

According to reports of successful tractor operators, the time devoted to the above divisions varies greatly

it should be constructed of high grade material, thereby insuring itself against excessive upkeep cost. Where steel should be used on account of its non-breakable and long-wearing qualities, cast iron should never be substituted. Friction should be eliminated as near as possible. It should be simple in design and easy to operate. It should be of a type that will not pack the soil yet will not mire and slip in soft soil. Its power should be rated conservatively—in other words it should car-

chase price of a tractor looks high to you—remember, "there's a reason"; it must have cost more to build and be worth more to you, or its builders would not ask more for it, and don't forget that a good tractor pays for itself many times during its entire life.

The good tractor has come to stay; and steadily the chorus grows of those who repeat "If I had to go back to horses it would be impossible to do my work." When you get a tractor get a good one.

Bates Steel Mule Pulling a Plow Without Kicking. "Just Twist Her Tail and Off She Goes."

with the location, but a fair average is as follows:

Plowing, 25 days; disking, harrowing, rolling, 15 days; belt work, 10 days; road work, 10 days; miscellaneous, 10 days. Total, 75 days.

Points to Consider.—So much for the work the ideal tractor should do—now the question arises, "What qualities should it embody in order to successfully do this work and prove a profitable investment?" First,

ry considerable reserve power for conditions of emergency. The purchase price of a tractor should not be considered alone—a tractor that is made for a price is never worth any more and as a rule the cheapest is the most expensive in the long run. The correct way to arrive at the price of a tractor is to figure the total cost of the tractor during a certain number of years, considering first its performances; and if the pur-

TRACTORS ON 4,000 ACRES.

[Written for Pacific Rural Press.]

With a 65 h.p. tractor helping, about 40 mules and horses work a 4,000 acre grain and stock ranch, J. McCormack of Rio Vista says, "Provided you are using your tractor most of the time, I think \$250 per year will cover all repairs for five years." He has been using tractors five years and has two.

The High cost of Low cost

Low cost in the first place means high cost in the last place

1. The price of under-powered tractor
+ the cost of keeping horses
= the cost of a YUBA
which replaces all the horses

In the long run it pays to buy the high-powered tractor.

2. The price of poor traction—round wheel
+ lost time in plowing
= the cost of a YUBA

In the long run it pays to buy the tractor that does the plowing quickly

3. The price of one-purposed tractor
+ loss of opportunities
= the cost of a YUBA

In the long run it pays to buy the tractor that suits all purposes—is ready for every job.

THE YUBA
BALL TREAD TRACTOR

4. The price of tractor requiring expensive repairs
+ cost of exorbitant upkeep
= the cost of a YUBA

In the long run it pays to buy the tractor that is built to work 24 hours a day and give constant service at lowest cost.

5. Price of cheaply built tractor
+ high depreciation charges
= the cost of a YUBA

In the long run it pays to buy the tractor built by an organization of skillful engineers with an international reputation to uphold.

6. As you continue to use a tractor you will eventually pay the price of a YUBA. It is wiser to do that in the first place and save the worry due to delay, and the annoyance of continued repairs.

If you haven't a YUBA catalogue, we'll be glad to send one on request

He does all kinds of work with them on a large scale. Naturally it would take a great herd of horses and mules to prepare the seed beds properly on such a large ranch and in the short time available. It might also be hard to get the ex-

tra help when needed and the animals would have to be fed the rest of the year. Fuel interest and repairs cost much less than the extra labor would without the engine, to say nothing of the expense of more animals.

Better Orchard Work in Less Time.

[Written for Pacific Rural Press
The land of golden oranges and sunshine failed to save Mrs. Errant from the greatest loss that can befall a woman; but the outdoor life of an orange grower proved a healing balm which has left her the jolly active 40-year-young mother, who finds joy in riding the orchard tractor with which her son of 21 years cares for their own and a neighboring orchard. Mrs. Errant tells the story simply.]

We came to California the fall of 1911 on account of my husband's health. The support of a family of four fell upon me and my son James. Errant, then a youth of 16 years. Because we wished an outdoor life and because we thought it would be a means of meeting the financial needs of the family, we bought our 10-acre citrus orchard, near Rialto. The following spring, with the char-

by Mrs. Derexa M. Errant, Rialto.]
tivator, and a Planet Junior cultivator frame, to which a twelve-foot plank was fitted to carry four shovels. This tool makes all the furrows in the middle at once. A small cross-reach wagon to use in and about the orchards was also secured. After two years, we are well satisfied with our experiment. Our soil is in much better condition, the trees have improved in color and vigor, the crop is better, we have reduced expenses, and we have learned some valuable lessons.

Expense of Tractor.—The tractor has been used 106 days—63 days on the 20 acres, 43 days in doing work for others. The following variety of work has been done: Plowing, disking, furrowing out, cultivating, hauling, pulling road scraper, pulling trees and moving small farm buildings. The items of expense for

Tractor, Making Four Irrigation Furrows at Once in an Orange Orchard of San Bernardino County.

eristic daring of ignorance (for we were total strangers to citrus culture), we planted a 10-acre orchard for my sister adjoining us. Fearing for these, and solving the many problems they have presented to us, have kept us busy with both mind and body. We have met the stress of freezes, floods, and lean years. In spite of it all, we have had success above the average and am "still in the ring. Fairly good for a kid and his mother," as my son expresses it! Because I have held my end of the task, I am in the picture. I just naturally belong to the "outfit."

Hired Teamwork Unsatisfactory.—For several years we hired the teamwork on the 20 acres. It used to cost \$250 a year. This spring when teams would have been needed, they were all working the roads. Although it had been hard to get good work done. Because the results proved both unsatisfactory and expensive, we decided to buy a tractor and do the work ourselves.

Tractor Improves Conditions.—In July, 1914, we bought an 8-horse tractor, and the following tools to use with it: A three-gang Oliver with 14-inch bottoms, an eight-foot Clark double cutaway disk, a foot Forkner spring-toothed cul-

operating are:
Engine distillate, \$103.19 or .973 per day
Lubricating oil, 56.40 " .532 " "
Cup grease, 2.40 " .022 " "
Repairs, 32.15 " .303 " "

Total, \$194.14 " \$1.83 " "
Adding four dollars a day for the operator's time and skill, the total cost on twenty acres for sixty-three days or two years' care is \$367.29.

Doesn't Abuse the Tractor.—My son has always driven the tractor himself. has taken great care to keep it in good working order, and has never abused it. Before the heavy work of the coming spring begins, with the help of an expert mechanic he will overhaul it and put it in order for another hundred or so days' work. He estimates, from what he knows of the condition of the machine, that this can be done for about \$75. This item of cost for depreciation will be charged to the account of the next hundred days. For custom work the charge is sixteen dollars for an eight-hour day—\$688 has been earned in this way. This amount could have been doubled, could the time have been spared from our own work. If the demand for work had been sufficient to justify employing another operator, we have the equipment to do all the heavy work on 150 acres if properly organized.

-All Steel-

DECIDES THE TRACTOR QUESTION

When you invest in a Tractor you want it to work when you need it, and do the work at the least cost for upkeep, don't you?

That is just what the Tracklayer will do, because by the using of steel instead of iron, breakage and wear is reduced to an absolute minimum.

Everywhere practicable, the Tracklayer is made of high grade steel. We operate the Best Steel Plant, which makes it possible for us to use more steel in the construction of our Tracklayers than is used in building any other tractor.

Until Mr. Best invented the "Rocker Joint," the weak spot in this type of tractor was the track joints, because they could not be successfully oiled. The C. L. Best Track does not give way to excessive wear and abrasion, because in the Rocker Joint the pins merely rock from one flat surface to another as the links of the track bend; therefore the twisting and grind so noticeable in the spool and pin design is absolutely eliminated and the life of the track is greatly prolonged as well as additional power transmitted to the drawbar. With the "C. L. B. Oscillating Tracks" one track can go down in a rut and the other track be up on a hummock without disturbing the equilibrium of the frame. This reduces the strain due to the rigid track construction, and being spring mounted, eliminates jars in going over rough ground.

All Tracklayers are driven by steel cut gears, and the gear drive employed in the Tracklayer simplifies the transmission, reduces the number of wearing parts and last longer.

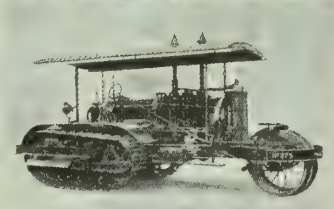

The Tracklayer is simple in design, low and compact, easy to operate and will work on ground where a round wheel tractor would mire or slip. It can be used the year around for every purpose, and is especially adaptable for plowing when the ground is soft—its traction surface is so great that it cannot pack the soil.

We have just the size Tracklayer for your needs, so fill out the attached coupon and mail it today. Our folder will give you further information.

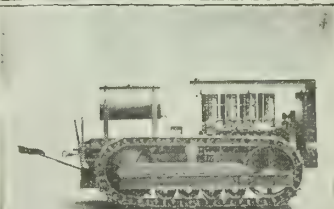

C. L. BEST GAS TRACTION CO.
105th Avenue OAKLAND, CAL.

See our Demonstration at the California State Fair—Sacramento, September 2nd to 9th.

We also manufacture 45 H. P., 90 H. P., Tracklayers and 75 H. P. Round Wheel Tractors.

75 H. P. TRACKLAYER
Pulls 12 12-inch plows—12 inches deep. The Ideal Tractor for the large ranch or contractor. Does the work of 40 horses.

30 H. P. TRACKLAYER
Pulls 6 12-inch plows—10 inches deep—suitable for orchard work—gets close to the trees and turns in its own length—does the work of 16 horses.

16 H. P. "PONY" TRACKLAYER
Pulls 3 12-inch plows—10 inches deep. Just the size for the small orchard or vineyard—the most flexible and compact Tractor made—does the work of 8 horses.

Co-operative Use of Tractor.—Our experience with the tractor has added strength to our conviction that the citrus grower can find no more certain way of increasing his profits than by co-operating with his

neighbors to make the necessary investment. They should not be deprived of the economy and efficiency of the tractor, when co-operation with others would give it to them. There is no item in the cost of production

Sandusky Tractor in San Fernando Valley, Equipped with Special Beet Wheel for Digging Two Rows of Sugar Beets at Once.

neighbors to reduce the cost of production. Alone, on 20 acres, we have done better work, in less time, for less money. On a larger acreage, sharing the cost of equipment and operating with other growers, the results would have been still better.

Many small growers appreciate the value of a tractor, but are unable

which could not be reduced in the same manner, if the growers would unite to make the best of their opportunities.

There are indications which tend to show that it is only a matter of time when, to save themselves, they will be forced to think seriously in this direction.

FOREST RANGE PRICES.

To the Editor: Please tell me the price the Government charges for range and also if there is a different price for stock, horses, and mules. Also how long the range is open.—E. B. B., Orosi.

[Answered by T. D. Woodbury, U. S. Forest Service.]

[The charges on the forests in your vicinity are 72c for cattle, 90c for horses and mules, 43c for hogs and 18c for sheep for the year-long season, which begins March 1. Shorter seasons are charged for on the basis of one-ninth the year-long rate, per month, for periods less than four months beginning between July 15 and Oct. 15; and one-tenth the year-long rate, per month, for periods of four months and over beginning between Oct. 16 and July 14. The minimum charge per head is 20 cents for cattle, 25 cents for horses, 12 cents for swine, and 5 cents for sheep and goats. There is an extra charge of 2 cents per head for sheep and goats which lamb or kid on the range. Applications for range must be sent to the Forest Supervisor six months in advance of the opening of the grazing season. The headquarters of the Sequoia National Forest are located at Hot Springs, Cal.]

POISONING FIELD RATS.

To the Editor: Field rats are overrunning our delta ranch and eating the corn we plant. Have been unable to poison them.—J. C., San Francisco.

[Answered by Surgeon C. C. Pierce of U. S. Health Service.]

[Cage traps baited with fish heads or bacon scraps would likely be successful. We have found the following poison very effective, and it kept fresh so well that dead rats were found three or four weeks after the poison was placed.

Melt 4 lbs. cheese with 6 oz. glycerine and 2 qts. water; then add 10 lbs. cornmeal and a gallon of water. Continue to heat until cornmeal is thoroughly cooked. Then

stir in 4 lbs. finely powdered white arsenic; and if convenient add enough black aniline to color to a slate gray so that chickens and other animals and children will not notice it. Then add ½ oz. oil of anise. More or less water may be required, as the meal must be pasty. The poison must be finely powdered so there will be no grit in the paste. The aniline may be omitted if hard to get. None of the ingredients should be handled with bare hands as the human odor might make the rats suspicious.

The paste was kept in tin fruit cans, each containing 4 lbs. Each man placed a can per day in 800 to 1000 holes or runs, with a small mixing spoon similar to a cheese scoop. A piece about the size of a hazel nut was placed in each hole or rat run in such a way as to conceal it from any person or other animal.

OLD AND NEW BARLEY.

To the Editor: Have paid the higher price for old barley to sprout for my chickens. It failed to sprout satisfactorily during the recent hot spell. The sacks are stencilled "Re-cleaned barley" and it looks fine in the grain, but I suspect it is new barley. How can I tell the difference, and is there any recourse under the law or any official inspection?—A. F., Hayward.

[Aside from the slower sprouting of new barley, this season's crop can be distinguished from that of last year in a general way because this season's barley is plump and bright as a rule while the other is more or less weazened and weather-stained on account of the rains and winds of last year.

There is no law to prevent a man from substituting new barley for old, but after July 1 he is not likely to, as the old barley is less desirable on account of risk of weevil infestation and the extra cost of inspection. There is an unwritten law among grain dealers that after July 1 all old grain sold shall be so specified.]

Buying Tractor for Grain Ranch.

[Written for Pacific Rural Press]

In buying a tractor, the first thing to investigate is the motor and accessories; next, the clutch and transmission; next, method of driving from transmission to wheels or track; next, lasting qualities of

were made in Mr. Gibson's own shop, which has been described in these columns.

Sowing Grain.—He uses six horses to sow the seed. This must seem like slow work, for he reports:

Waterloo Boy Tractor Providing a Dust Mulch in an Orange County Orchard.

rack and drive; next, frame to carry the above in good shape. For all-around use, get a sliding gear and rabbit bearings are the best.

These are the recommendations of G. W. Gibson of the J. S. Gibson Co., Williams. He has been using one tractor six years on a 500-acre dairy and grain ranch.

When he bought the machine, it had a 45 h.p. motor; but this proved too small for Mr. Gibson's ambitions, so he took out the engine and mounted it on a I-beam frame to run a big centrifugal pump to irrigate alfalfa, etc. An 80-horse-power engine was put into the tractor, and despite the tremendous power, the leakage has been less than was expected. An average of \$200 a year has paid all repairs. Part of these

"Dragging 60 feet of heavy iron harrows, no work at all. Engine giving excellent satisfaction."

The Ramina Ranch of Tehachapi goes him one better on seeding. Their 75 h.p. Caterpillar pulls three grain drills and harrows over 75 acres in ten hours; and goes on working all night to plow half that much ahead. Thus they need not work their horses on the soft land, nor is it necessary before planting time to plow more than half of what is to be seeded.

T. B. Wohlfrom of Arbuckle reports pulling 42 feet of Gorham seeders with his tractor over very rough summer fallow, work that would require 30 good mules.

Keep connecting rod bolts tight.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

Power Gopher Drainage.

[Written for Pacific Rural Press.]

The Santa Ana Sugar Company has been working about four weeks with the latest method of drainage, on its Sugar Company, and the other two belong to I. M. Von Schriltz. This method of drainage has been

ifornia about two years ago by the American Sugar Company at Arlington, Chino, and on the Patterson Ranch at Oxnard. It has proved successful in draining the ground more perfectly and quickly than the system of open ditches.

Three Holt Caterpillars Pull the Mole Plow, Making an Eight-Inch Drain Four Feet under the Surface.

800-acre tract south of Santa Ana, on the McFadden pasture. The eight-inch subterranean bores are being made four feet under the surface.

Three large tractors and a Gopher Plow made by the Killefer Mfg. Co. of Los Angeles are used in the new system. The plow is a single beam affair with a point similar to a subsoiler, on the head of which is a steel torpedo, or gopher, eight inches in diameter. This is pulled through the ground at a depth of about four feet, forming a perfect eight-inch drain. The drains are thirty feet apart, all leading to the main ditches, which have been made with dredgers.

The drains last two to sixteen years, depending on the character of the ground. The Gopher Plow makes a smooth-faced closed bore. The beam is narrow and cuts through the ground like a blade.

Tractors, one 75-horse-power and two 60-horse-power, handle the drain maker with ease. One machine is owned by the Santa Ana

Bore Made by Gopher Plow in Hard Earth.

Notice to Irrigators

California-Nevada-Washington-Oregon

Beginning September 1, 1916, the undersigned is ready to make shipments from its warehouse in Stockton, California, as well as from Denver. This new arrangement will save you time and freight. A convenience for you Pacific Coast farmers who are facing irrigation or drainage ditch problems.

For making and cleaning laterals and ditches no machine is superior to the **Martin** farm ditcher—and there is no equal at the price. Works right or left-handed, in new or old ditches, large or small, in sandy or rocky ground, in gumbo or heavy clay, on hillside or the level, ordinarily with a single team. Cutting blade of crucible steel.

The **Martin** is mechanically simple. No wheels, gears or pinions to wear out and need early replacing. All steel. If you have not received our fully descriptive catalog, ask for it TO-DAY. The **Martin** "costs less than a cow" and on an 80-acre irrigated farm will save the price of three cows in a single season. Write RIGHT NOW.

SQUASH FOR SHOATS.

To the Editor: We have planted between rows of a young apricot orchard, about 4 acres of so-called "bug-proof" squash. It is our intention to purchase a couple of shoats. Can this squash when ripe be used as hog feed, and how much should be fed and with what other feeds, to produce proper weight?—R. R., Cupertino.

[According to the dictionary a "shoat" is "a young hog" and a "shote" is "a half-grown hog." If you had used the latter spelling it might seem easier to answer your question, for if the hog is half grown, and therefore may be held to have good size and frame, squash will serve him better than if he has that growth still to make. For the little pig, squash is poor feed: it does not contain the protein he needs to make growth. This he could get from alfalfa or skim milk, or from tankage, millstuffs, oil meals, etc., (to be used carefully in connection with a little grain) and if he has what he needs of these he can fill up with squash. Squash pie would be good for a growing pig: because it has to have lots of milk and eggs in it, not because it is squash. For a half-grown hog, whose business it is to make weight, squash is better and will whet his appetite for grain and other solid foods, which are necessary to make good pork, and will help to keep him cheerful and contented. You can give the pigs all the squash they will eat in connection with other feeds such as suggested. For the understanding of this matter in detail you should have Woll's "Productive Feeding of Farm Animals" and Guilford's "California Hog Book."—Eds.]

GOVERNMENT BUYS SHEEP.

To the Editor: In reference to the list of Proposals for Government Supplies, to which you called our attention, published in U. S. Daily Report No. 181, dated Washington, D. C., Thursday, Aug. 3, 1916, and received here yesterday, the following would interest many California breeders but is too late:

Live stock, No. 3481—Sealed proposals will be received at the Office of Indian Affairs, Washington, D. C., until August 25, 1916, for furnishing and delivering 100 rams for the Leupp Agency, Leupp, Ariz.; 130 rams for the Mescalero Agency, Mescalero, N. Mex.; 60 rams for the Moqui Agency, Keams Canyon, Ariz.; and 250 rams for the San Juan Agency, Shiprock, N. Mex. Specifications will be furnished on application to the Washington office.

We are unable to find a copy of these specifications in San Francisco. As Pacific Coast breeders must make application to Washington, these specifications would be received on the Pacific Coast about Aug. 21, which would not allow sufficient time to return the "proposal" to Washington by Aug. 25.

In the interest of the livestock breeders located in the Pacific Coast States we suggest that such livestock breeders request the departments at Washington to provide for the distribution of similar specifications from stated government offices located in the principal coast cities. Eugene R. Croley, Mgr.

San Francisco Livestock Export Co.

Are you planning to handle grain in bulk next season?

LAYNE & BOWLER

HIGH DUTY PUMP

Here is illustrated the Layne & Bowler direct connected, oil-balanced turbine pump, for high duty, deep well service. It is used for lifts greater than 200 feet. This is beyond all question the most compactly designed high duty pump ever constructed.

Our special oil-balance feature, we believe, is the greatest single improvement made since the advent of the centrifugal pump, and it has made it possible to use the centrifugal pump for all heavy duty requirements.

Our new Catalog No. 25 fully describes and illustrates this pump as well as many other styles. Write at once for a copy.

LUITWIELER PUMP

Automobile manufacturers long ago discarded the one-cylinder motor, because the power delivery was too irregular; it jerked and jarred, soon ruining the motor and consuming an enormous amount of fuel. They reached this mechanical truth; that the steadier and more even the power delivery, the greater power created and the less fuel consumed. This basic truth also applies to pumps. The Luitwieler

(non-pulsating) pump has absolutely the highest efficiency and delivers the stream of water as steady and even, comparatively, as a 12-cylinder motor delivers power. This pump consumes absolutely the least power. You should write at once for our free irrigation booklets.

EDITORIALS

LISTEN to the long, rolling laugh of the California farmer, as it fills the vales the hills among: "Hah!"

Why laughs he so long and loud? Let this announcement answer:

That the money made by the fruit and vegetable farmers of California during the season ending September 1, 1916, will break all previous records for the State, is announced by the Home Industry League of California, which predicts an unusually successful "fall trade" for merchants generally as a consequence.

The shipments of carload lots of fruit and vegetables out of the State, up to August, were so much greater than in 1915 and brought so much higher prices that the farmers of California will net a profit this year of more than 60 per cent over that of 1915. If the box-makers can find a way, before the fruit season ends, to turn out many more boxes than they are doing now, the money earnings of California farmers for 1916 will be nearly double the total for the year before.

But why laughs the California farmer with a single "Hah!"? Because he knows that the above statement is not true in the breadth of the application that will be made of it, and because he knows also that such exaggerations of his prosperity always tend to decrease rather than increase his real income for the future. Such over-estimates of farming values are only useful to tax-eaters and land gamblers, both of whom ply their trades for the reduction of the farmers' net income. To say that California farmers' incomes increase 100 per cent in a year is not only a tremendous falsehood, but it is most deadly in destructiveness to the moderate increase which he is actually realizing this year. Such false reports make it exceedingly hard for the farmer to get what he really deserves, either in money or in public consideration; therefore, when such jubilant declarations come to his eye or ear, he laughs with but a single "Hah!"

TWO EVILS POSSIBLY ESCAPED.

AND yet the California farmers are cheered and encouraged by the moderate increases in prosperity, which they, as a class, are receiving this year. Even those individuals whose year's incomes are reduced by untoward conditions are helped to endure by the greater future hope. Therefore, all are reasonably glad that there is some increased goodness in the passing year for the business in which they are all engaged. They are probably glad also over what seems, as we write, a fortunate escape from losses which might have been severe. An August rain, which dropped a quarter of an inch in San Francisco and immediate vicinity fortunately did not extend into parts of the State where drying fruits and other products lie exposed, in full trust in a dry sky during a month which is, of all months, most trustworthy. It might so easily have been otherwise. Let it be noted as an instance in which the farmers' luck was not adverse.

Another narrow escape seems to lie in the report, on Tuesday, that the great menace of a transportation embargo will be averted. It is hard to estimate what loss would accrue to California

producers if a tie-up of railways should be realized at this season of the year. Every previous misfortune of that kind has worked havoc with our perishable products and influenced producers' returns adversely, far beyond the period of actually blockaded movement. It would have been particularly disastrous this year and farmers' luck may have another credit entry. And yet, what satisfaction can there be if such a menace always threatens? Manifestly a threat to arrest people and food products in freedom of movement in living and giving life should be made impossible in any country claiming to be civilized.

AN INDUSTRIAL DEAD-CENTER.

WE ARE not losing our old admiration for the rulership of industry or enterprise by the creator thereof. It still seems to us fitting and just that the man who plans a commendable business should be free to buy what he thinks best to equip that business and to hire whom he desires for its operation, at such wages as he and they shall agree, and to sell the products of it for such price as he can persuade purchasers to pay. We cling to the old idea that if a man can not do this he becomes no longer free to exercise his powers and use his means in the operation of his business for present reward, and in its upbuilding for future profit to himself and to those who succeed him in ownership. But while admiration for this old ideal of the rights and privileges of a man still hold fast in our thought of what is fair and just to him as a masterful man, and while we feel sympathy for the attitude of such a man when he declares that if he cannot run his own business as he thinks best, without injury to others, he will abandon it, we are still oppressed by the strong conviction that the old ideals of creators' and managers' rights, privileges and opportunities are becoming impossible. All kinds of regulation in the alleged public welfare are coming in, and a man's rights as producer or operator are being either wholly denied or sharply curtailed, and he is being effectively told that certain things he cannot make, certain things he cannot buy nor sell, certain labor he cannot hire at all, and certain other labor he must hire at wages which he thinks his business cannot afford. We are not arguing that such regulation, in alleged public welfare, is justified or otherwise; we are simply citing facts which have to be reckoned with as parts of the present industrial situation. As between the old ideal of a man's proper mastery of his own enterprise, the modern ideal of the public's right to regulate and the modern ideal of organized labor's right to prescribe and prevent all industrial issues seem to us to be fast rushing to a "stale-mate"—that unfortunate condition in chess-playing which ends progress without attainment.

WHICH IS THE WAY OUT?

IT SEEMS to us pretty clear that there is no hope for settlement satisfactory to anyone by continued conflict. Labor, exercising its right to organization, is not only insisting on wages (which may or may not be just, but it is undertaking to dictate who may and may not be hired, which surely seems to be beyond its right, both with respect to those who wish to hire and those who wish to work. On the other hand, employers organize and refuse wages (in which they may or may not be right) and in some cases refuse to hire members of organized labor associations, which surely seems to be beyond employers' rights with respect to individuals who are willing and competent to do the work required. And between these great conflicting organizations there is likely to arise at any time a deadlock or stale-mate, which will stop trade, manufacture, transportation, travel and everything else which is essential to popular comfort and prosperity. Which is the way out?

It seems to us that the only way to meet the regulation which opposing interests are vainly endeavoring to inflict on each other, is to bring all the vain, conflicting attempts to regulate under a higher regulation which shall be competent to say to each contestant: you shall do thus and so. There are surely men in this country competent to see through hurly-burly to justice and right, and there are men of such perception who do not have their

eyes crossed by the lure of pelf or politics. There should be some way by which contestants, as soon as their issues threaten the public interest, are compelled to submit their claims, not to each other nor to self-chosen arbitrators, too prone to compromise, but to a high national court, which shall have all the machinery of a national court to enforce its decisions, which shall be on the basis of right as between the parties themselves and the relations of both to the public interest. From the decisions of such a court we may get suggestions of rights, public and private, upon which laws to meet present conditions can be enacted. Of course, as the conservatives always remind us, there are many things which cannot be settled by legislation; but when conflicting interests threaten the continuance of public conveyance, and thus endanger the subsistence of the people, there must be law and courts to protect the public against selfish aggression. We have plenty of regulation contravening old ideals of individual rights; let us have some regulation to protect those rights which must still belong to the individual.

SHIPS TO COME SAILING.

THINKING of freedom of produce movement and ways to protect it, facts about ships suggest themselves. But because we have more ships than one would have dreamed of three years ago, we are not less in need of wide-open railways, but rather more so. It is important to know that war-time is building more ships than it is destroying, and therefore many shadows are removed from our trade outlook, but it is satisfactory to know that so many more are American ships, in construction at least. The bureau of navigation, Department of Commerce, reports 1030 vessels, of 347,847 gross tons, were built in the United States during the fiscal year ended June 30, 1916, compared with 1266 vessels, of 215,711 gross tons, during the fiscal year ended June 30, 1915. Of the 1030 vessels 258 were built in Pacific Coast shipyards, 497 in Atlantic yards, 132 on the Great Lakes and 143 on Western rivers. This stimulated building in Pacific yards is particularly gratifying. It is, of course, out of all proportion to our population and business, as compared with the Atlantic Coast, and is therefore especially interesting, as it betokens industrial activity which will be upbuilding in all ways. And what has been done in the last two years will be far exceeded in the future, for millions of money are now going into increased shipbuilding facilities on the east shore of San Francisco bay. Shipbuilders are surely awakening to a realization that the Pacific is worth while.

KEEP AN EYE ON RUSSIA.

THE development of steamer routes across the Pacific will no doubt cover new connections with the eastern terminals of the Siberian railway, which should distribute many Pacific coast products all along its course to its European terminals. California should find in that direction a new outlet for food products which can not be produced in those latitudes. An American commercial attache who has recently returned reports that notwithstanding the war there is an underlying condition of great prosperity in Russia, as evidenced by advancing wages and by enormous gains in the savings of the people. The accumulation of savings is due chiefly to the abolition of vodka, which has had far-reaching economic effects, not only in preventing waste of savings, but in improving the efficiency of industry. There are about 170,000,000 people in Russia, most of them with steadily improving standards of living and increasing

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 15, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	1.36	.14	64	53
Red Bluff	0	.68	0	92	58
Sacramento	0	.07	0	86	52
San Francisco ..	.22	.25	.01	70	52
San Jose	0	0	.01	82	48
Independence	0	0	0	92	50
Fresno	0	0	0	90	58
San Luis Obispo ..	0	0	.03	70	50
Los Angeles	0	0	0	78	54
San Diego	0	.02	0	72	58

ing savings and the long pent-up accumulation of buying power should result, in demand for goods of all kinds from the United States. For warm climate food products Russia should be considered in our legitimate sphere of influence. She has only a limited supply in regions of her own or near to her and she has more appetite than all other north European countries combined. If we can only get her to going on our cured fruits it might not matter much if we were embargoed out of the Atlantic ocean side of Europe, but that is not going to trouble us long either.

FRUIT CANNERS' CONTENTMENT.

THE reference to Russia as able to take the whole mass of our cured fruits without a single ache reminds us that we ought to say an appreciative word of the gladness of those who are doing big business in fruit canneries. A year ago a whole sky full of light bombs could not penetrate the gloom which enclosed these good people. This year they have been singing their way through a hydraulic sugar press such as they never saw before and paying more money for the fruits they like than anyone expected to get while the war is on. We do not know exactly what makes them so boisterously happy, and we do not care much so long as they take plenty of fruit at high prices and get away with it some way. And yet we have an idea something great is going on. We take to the financial pages of our daily contemporaries for light reading and we saw there the other day that the stock of one of our leading canneries "turned up on the local exchange 135 bid, with none offered. Those who have tried and failed say it is impossible to get a share of the stock at anything like recent quotations." This is a little out of our vernacular and yet we must take it to mean that cannery stock is good stuff to buy to sell again or good stuff to keep, and we do not care much which; though of course we would rather that all the canners should keep busy with fruit than try to can each other. If they did too much of that, those who remained on the outside of the car might try to can the fruit-grower next, and that would be a bad and unprofitable practice, which we might have to condemn. At the moment we pass up the canneries as a very good business. Perhaps some one is trying to get too much of a good thing which may not be so good after he gets it, but we hope it will not have to turn out that way.

SECURITY IN RURAL CREDIT.

IT IS perhaps to be expected that some rather obscure things should be said about these days to increase or to diminish the political value of the recent rural credit legislation, but there are some utterances which we cannot at all understand. One such thing is this:

Under the system no actual property security will be required to back up the negotiable paper the farm banks are authorized to issue. In the final analysis the unsecured promise of the farmers' association is to be depended upon to give these notes circulation at par. The system is entirely experimental, as its creators have ignored most of the essential lessons of European rural credits systems.

The only negotiable paper we find in the law consists of debentures or bonds secured by first mortgage up to 50 per cent of the value of farming land, as appraised by the land bank experts, and to 20 per cent of the insured value of improvements. These bonds certainly have "property security" and they are all the land banks are authorized to issue.

We do not know at all what the above writer means by "notes in circulation," for there are no notes except such as a borrower gives in connection with his mortgage, and they are not in circulation. They remain in the bank with the mortgage, which is the security for the negotiable bond which is issued.

The only issue aside from bonds is stock, which the borrower has to take and pay for, to the amount of 5 per cent of his loan and this stock, in the care of a farm loan association, is not in

circulation. It is held in trust by the loan bank as collateral security for the loans made to the association members.

So far as the above provisions go, the law is in line with European methods, as we know them.

Negligent Winter Nelis.

To the Editor: I have about 50 pear trees of Winter Nelis pears on rich, sandy, loamy soil which grow very thrifty but do not bear. They blossom heavily but do not set. Later on they have a few more blossoms and a few set. Bartlett pears next to these trees do well and bear every year. Can you tell me why they do not bear?—W. C. S., Santa Barbara.

Winter Nelis is a shy or irregular bearer, and though this behavior has puzzled Californians for decades, no solution has come nearer than "natural cussedness." When the idea of needed cross-pollination for pears arose about 30 years ago it was thought that association with other varieties would improve Nelis' behavior, but only negative results came from trials. Probably if this pear had proved of greater commercial account, persistent inquiry would have disclosed Nelis' secret before this time; but, lacking that, the few growers have let Nelis do as she likes.

Is It Coulure?

To the Editor: I have several different varieties of tame grapes, which last spring bloomed and set fruit, but the fruit is very uneven in size. Some of the grapes are getting ripe while others seem to be just forming on the same clusters. Should they have been sulphured, and when?—J. S., Anaheim.

The appearance of fully developed berries and miniature berries on the same clusters is generally attributed to coulure, or the failing of some berries to be properly pollinated which is necessary to the development of varieties which have seeds. Sometimes mildew may be an agency preventing development and for this sulphur should be used, first as soon as the new growth appears, in advance of the blooming and again after the blooming, as long as there are signs of mildew on the foliage—several applications being made during the season, if necessary.

Budding Peaches.

To the Editor: What season of year to bud one variety of peach onto another variety to be successful in getting them to grow? Can peach buds be budded onto apricot trees, and if so at what season of year?—J. J., Anaheim.

Peaches can be budded as soon as you can find good plump buds on the current season's new wood. This is usually in June. Budding can continue as long as the bark on the new shoots will lift well and this may be in August or even in September, if the trees are irrigated. The fact is, then, that peaches can be budded all the way from June to September, if the sap is kept running well. You can bud the peach into new shoots of the apricot and usually have them take well, but this is not done largely in commercial propagation, because the peach is likely to over-grow the apricot stock and either be dwarfed or not make a very good union. Still it usually works well in a family orchard.

The Chance in Sour Cherries.

To the Editor: In one of the mountain districts of this county a few varieties of sour cherries such as Montmorency and Royal Duke have proven especially adapted, yielding a large crop when the apples and pears failed on account of frost. These were used as border trees so the yield has been small, the local markets handling the larger portion of the crop. A number of inquiries have come as to the advisability of making large commercial plantings of these cherries. Will you kindly advise as to the prospects for the future market of these cherries?—H., Bakersfield.

Sour cherries are very hardy and can be grown in all parts of the United States—even in the interior mountain plateaus and generally east of the Rocky Mountains—which places suited to sweet cherries are few and the product small. This fact constitutes California's opportunity to grow sweet cherries both for fresh shipments and can-

ning. Eastern canners can put up all the sour cherries the traffic will bear, but very few sweet ones, and they are poor as compared with the California product. In addition, the California markets call for very few sour cherries. The sour cherry pie is ideal, but the amount called for is small as we have so much other pie timber available. We would be careful not to plant sour cherries in excess of your local demand.

Repeating Applications of Gypsum.

To the Editor: Some of my neighbors say that if you use gypsum once you have to keep it up or your alfalfa will not do well. Is that true?—J. A., Madera.

It is probably true, just as true as it is of water though not quite in the same way. Gypsum is a form of lime, and to that extent is useful food for the plant, but it is different from common lime because it contains also sulphuric acid and this is indirectly a tonic for the alfalfa plant and stimulates greater growth. It is customary to use it in rather small applications, say about 400 lbs. per acre, and the effect upon slow-growing alfalfa is excellent. It is usually desirable to repeat the dose at intervals as the plant may seem to need it, but for its regular feeding of lime a cheaper form, like ground limestone, is more economical.

Alfalfa on Heavy Soil.

To the Editor: My land is very heavy and when irrigating alfalfa the water stands for two and three days, even when I only put on 4 or 6 inches of water. What do you advise doing? I have the land in summer fallow this year to kill Johnson grass and I wish to put in alfalfa this winter.—A. C., Madera.

Land which takes water that way is a pretty hard proposition for alfalfa, for it is pretty likely to kill out when the sun comes on standing water. If you have such hard soil over alkali hard-pan the alfalfa is likely to be hit both above and below. But if you have a good stand of Johnson grass on the land it is probably not strongly alkaline. If this is the case, you should figure on blasting the land in the hope of making it take more water and taking it faster so that it will not stand around on the surface. The surface soil can also be mellowed by use of lime, to be dissolved and set at work by the rains in advance of the alfalfa seeding.

Safety with Sorghum.

To the Editor: I have ten acres of sorghum eight weeks old and four feet high. Would it be harmful to feed it to cattle now? If it is harmful, please tell me what age it would have to be before I could feed it to cows.—Subscriber, Kingsburg.

So far as we know it is not possible to measure safety either by age or height, unless, of course, you let it go pretty dry, which is undesirable. It is the very rank growth which is most likely to be poisonous—especially a second growth after cutting, though otherwise also. There are two safeties known to us in feeding. One is to feed a little after other feeds, and not allow hungry stock to gorge themselves with it. Another is to cut and allow a wilt before feeding, which disorganizes the poison. Begin gradually in either of these ways, and it will go all right, and you will probably find farther precautions unnecessary.

The Melon Aphis.

To the Editor: What insect is eating my water-melon vines up, and what can I do for it? It is a very small green louse or bug on the underside of the leaf. They commence at the root of the plant and destroy the whole vine in a short time. They leave the vines and melons covered with a dark, sticky-looking stuff.—J. A. D., Red Bluff.

It is the melon aphis; hard to reach, but easy to kill if you can reach it, with soap and tobacco spray (one part of soap, one part of 40% nicotine extract to 900 parts of water). Use a nozzle which will shoot upward to the undersides of the leaves. Fighting should begin as soon as you see the first of them earlier in the season, and be kept up from time to time until the plants are free or beyond injury.

Date Culture in California.

Date culture and marketing are very successful when the exacting cultural conditions are met. The Growers' Ass'n wishes all date growers to succeed and they stand ready to advise as to suitability of specific locations.

(Written for Pacific Rural Press.)

It was our pleasure last spring to eat a finely flavored cured-on-the-tree California grown Menakher date 16 months old. This was supplemented by a Thoory date two years old; and that by half of another date over three years old, all unprocessed, having been preserved by their own sugar. They were all drier than the imported dates we buy. Our host, W. L. Paul, president and manager of the Coachella Valley Date Growers' Ass'n, informed us that our imported dates are all dipped in syrup because they do not contain enough native sugar to preserve them for export to America.

He also said that the really fancy foreign dates never see America because there are not enough of them to supply the holiday demand in Europe at \$1 per pound! Moreover, the fancy Coachella Valley fruit sells at \$1 per pound, while some of it last season retailed in small packages at \$1.35 per pound. From talks with representatives of foreign countries during the Exposition, he believes we could ship dates all over Europe at prices that would net the growers 50 cents per pound.

So much for the market for fancy dates grown in California.

Select Locations Carefully.—We were told that of the 5,500,000 Deglet Noor date trees in their home, North Africa, 2,078,000 are planted under conditions which make them yield only 1-3 of a crop. If in their home of centuries, date palms are planted in unfavorable conditions, how much more likely they are to be so in America.

This is what happened in the Heber date garden in Imperial Valley where the palms were set in a depression of hard, cold, poorly drained, rather alkaline soil, where the cool moist air from surrounding alfalfa fields settled about them. For this reason these trees were shortly to be moved to Coachella Valley.

Need Long Season and Sandy Soil.—Because the date, so far as varieties have been tested, requires a growing season longer than is found elsewhere, because it requires sandy land which warms up early in spring, and which reflects its heat to the palms not only through the daytime but through the nights, and because it requires the driest kind of air and sufficient soil moisture, Mr. Paul says that 2-3 of what has been done in Coachella Valley with dates has been done wrong, and that only 25 per cent of Imperial Valley dates mature into commercially salable, long-keeping fruit. Coachella Valley date shipments in 1915 are given more or less reliably, as 12½ tons.

Growers Organized.—To protect the industry from the black eye which results from failures, whosever may be the fault, and to promote date-growing on lines proved profitable, the Coachella Valley Date Growers' Ass'n was formed about Jan., 1912. In March it had 120 members; and practically all new

planters join at \$5 each. Since the Association, co-operating with the U. S. Dept. Agr., controls and keeps record of all date offshoots imported from bearing trees in the old country, and sells them to members at cost, it is worth while to join. Even the U. S. Dept. Agr. is said to get its offshoots through the Association.

To insure getting the varieties desired, the Association has the services of a man who selects the offshoots personally in Africa, making annual trips for the purpose. Home-grown offshoots also must be sold through the Association.

Advise Prospective Settlers. Perhaps the most concrete service the Ass'n renders is to give advice on all matters pertaining to date culture, to strangers intending to go into the business. If the prospective grower wants to know about the suitability of a certain piece of land, the Ass'n will investigate that piece of land and make the best report their judgment dictates. It is to the interest of these guardians of the industry to prevent the growing of poor dates and flooding the market with them to the detriment of fancy dates. It is also necessary to so locate newcomers that they will become boosters rather than knockers.

Government and University Stations.—To test out varieties, etc., for this industry, which had its beginnings in Coachella Valley scarce 15 years ago, the Government has stations at Indio, Mecca and Brawley, while the State University has a Station at Meloland in Imperial Valley.

Varieties.—There are in this country about 250 named varieties of all colors, size, sweetness, juiciness, manner of growth, etc., but only a few are seriously considered for commercial purposes.

Deglet Noor has a good lead over all others, both in Imperial and Riverside counties, while the Itema, Tazizaoot, Hayana, Saidy, Thoory, and Menakher are especially promising, but are not yet being planted so largely.

Offshoots and Seedlings.—Offshoots, which grow out of the base of an old palm, reproduce the variety and the sex truly. The cheapest price at which the Association can import them has been \$2.60 each, while previous importers charged \$5 to \$25.

Since seeds reproduce their parent varieties with moderate accuracy, by far the most plantings are of seeds. Figures published by the Ass'n early in 1915 showed 600 imported offshoots 6 years old or over and in bearing, with 34,887 under that age. Of seedlings over four years old and bearing, there were 550; while younger seedlings numbered 497,000. These figures have been considerably increased the past season. In orchard form, the palms are usually planted about 30 feet apart, given customary cultivation, fertilization, and about five irrigations per season. Seeds are planted often two at a place, five or six feet

apart in the warm open fields January to June. This gives 8 or 10 plants at least, for every one that is to remain, since the seeds germinate readily. As about half of them are likely to be males, and only one to five per cent of males are desired in an orchard, this leaves four or five from which to select the typest female tree for each position.

Pollination of flower clusters on female trees, as shown us at the Meloland Experiment Station, is done by placing a spike of male flowers, at the pollen-shedding stage, in the center of a cluster of female flowers and tying it there temporarily. The wind does the rest. The Government has had viable pollen ten years old. It is considered good practice to save male flowers which open in winter, in case the spring male flowers should be scarce.

MAYNARD PLUM POOR CROP.

To the Editor: A neighbor has a nice orchard of Maynard plums. They seem to be very poor bearers. From all appearances his land is good; and we would like to ask if there is anything you might suggest as to why they do not bear more heavily. Is it lack of pollination?—M. R. J., Fresno.

F. W. Barkhaus, Newcastle: I experimented with a block of 600 Maynard trees for ten years, without getting any crop. Tried grafting part of each tree to other varieties thinking they might pollenize, but had no luck with that. Finally grafted them over entirely. My advice would be to graft over to Grand

Duke, Wickson, or Santa Rosa as I've had the best results from those varieties. Maynards do not bear in this section, as a number of us have tried them, and had to graft over.

Luther Burbank, Santa Rosa: In some localities the Maynard is a poor bearer, in others it is quite a heavy bearer. Like a great many other fruits, it is sensitive to conditions. My advice would be if the trees do not bear well in the locality where they are, to graft them over. Possibly a few grafts of "Formosa" or some other good pollinator might make them bear, but in any case, I would graft the center or top of the tree over to some good variety.

The Maynard is one of my oldest plums. Better ones have been produced since.

LABELS FOR FRUITGROWERS

Beautifully lithographed stock labels ready for immediate shipment. Write for free samples—address Label Department,

SCHMIDT LITHOGRAPH CO., San Francisco.

Established 1878. Incorporated 1906

Leonard Coates Nursery Co. MORGAN HILL, CAL.

Mermaid Spray Powder

**FOR CITRUS
AND
DECIDUOUS
FRUIT TREES**

ANALYSIS:—Curd Soap, 50%;
Bicarbonate of Soda, 0.5%;
Carbonate Soda, 37.5%.
Balance Moisture.

FOR ALL ORCHARD PESTS.

SOAP SPRAY—An effective soap spray used in the proportion of one pound of powder to six or eight gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

ERADICATES SCALE.

MERMAID SPRAY POWDER will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST—A cheaper and purer soap powder that is prepared with accuracy. Not the cheapest—but the powder that does the work.

UNIFORMITY—Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

IT WILL PAY YOU—to investigate Mermaid Spray Powder, and to use it, no matter how large or small your orchard.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found **MERMAID SPRAY POWDER** without an equal.

"Spraying Makes Healthy Trees"

The Latest on Cover Crops.

Melilotus indica has proved most generally satisfactory as cover crop except on sandy soil, where Windsor beans are recommended. Vetches and peas are too subject to aphids. Summer cover crops are still experimental.

[Written for Pacific Rural Press by W. M. Mertz, Superintendent of Cultivations, Citrus Experiment Station, Riverside.]

There is little question but that the area sown to cover crops has been increasing quite rapidly during the past three years. Very rough approximations would probably place the growers who actually planted cover crops in 1914 at 25 per cent. Since that time we have only to go by our observations in the larger of the citrus sections. From these observations we would estimate that the increase per season has probably been between 5 and 10 per cent, bringing it somewhere between 40 and 50 per cent for last season. This is not uniform, however, since some sections are almost devoid of cover crops while others have been planted almost solid.

Common vetch has not been giving good satisfaction for several years, due in part at least to the serious attacks of the green pea aphid. This aphid has had even a greater effect on the acreage planted to Canadian peas, the other important crop, which by 1914 had dropped to a relatively small proportion of the total.

With the European war cutting off the supply of German vetch seed, the year 1915 faced a dearth of the common varieties of cover crops. The experimental plantings of Melilotus indica the year previous had shown great promise. The recommendations which we had made in regard to this clover undoubtedly had certain effect also. At any rate the seed firms gathered in large quantities of melilotus clover seed, which was furnished at very reasonable prices to growers. Something over 60,000 acres were planted to melilotus. In large measure these plantings were successful, although in most cases they represented the first attempt at growing a clover in the orchard.

This year the vetch market is in much the same condition as last; and every indication is to the effect that melilotus will be the crop most largely planted. The fact that the rains of the past winter came during a relatively short period, with very little late rain, made many of the growers wait too late to turn their cover crops under. The very heavy rains washed out the furrows used in the fall, and many of the growers who were caught by the lack of late rains, were unable to irrigate their land before plowing and thus had great difficulty in getting the cover crop worked into the soil. For this reason, quite a number of growers are adverse to the use of cover crops this season. Those, however, who started plowing in February or early March are mostly satisfied.

I do not know that the acreage planted this season will exceed the acreage of last year. In some sections a considerable increase may result, while in others the effect of the late plowing last season may reduce it. In general, however, I believe the feeling is that the cover crop is a good thing and that with knowledge of its proper handling there is little added risk in the growth thereof.

Windsor Beans for Sand.—The very light sandy soils have not succeeded with melilotus clover; and we are recommending a trial of the Windsor bean for such orchards. The seed of this bean being quite large, permits planting at greater depths than can be done with vetch or clover. It is possible to place the seed in permanently moist soil and get good germination under very sandy conditions. Objections are that the seed is so large that it requires 100 to 150 pounds of beans to sow an acre thick enough for cover-cropping. This seed costs 4 or 5 cents per pound, which makes the cost of the seed two to three times that of melilotus. When, however, it is a question of probable failure to get germination of melilotus, or getting a reasonably certain stand with the Windsor bean, \$2 or \$3 per acre for seed is really not prohibitive.

We are working in co-operation with the Department of Agriculture in developing a smaller seeded variety of this bean. It is hoped that a seed about the size of the cow pea can be placed on the market in a few years. The development and germination of this smaller seed seems to be fully equal to that of the ordinary Windsors.

Purple vetch, which has been doing very well wherever tried, is not on the market this year. The Oregon growers seem to be unsuccessful in developing the seed-growing industry to date.

Summer cover crops are still experimental, there being a number of arguments both for and against their use. It seems certain that an orchard with a heavy summer cover crop will require considerably more water than would be necessary to keep the trees alone in good condition. Many growers are now using far more water than there is any real reason to use. In such cases, a summer cover crop could probably be grown without drying out the trees. And even a leguminous plant removes considerable available plant food from the soil while it is growing, so a summer cover crop may enter serious competition with the trees, in soils none too well supplied with plant food. There are growers who are very much in favor of summer cover crops, but usually they are able through peculiar conditions to use very much larger quantities of water than the average grower can possibly get. Again, very few growers have followed the practice of using summer cover crops long enough to know definitely what the results have been. We have recently started experiments, but it will be some time before we can discuss this subject intelligently. At present, we would neither recommend nor discount this practice, except under conditions where the water supply is undoubtedly too little for two crops during the summer.

Now is the time to give the trees a chance to bear a good crop of fruit next year.

A tree in a blasted bed (at left) roots deeper, grows faster and bears earlier than a tree set in an ordinary dug hole (at right).

"The soil is the pasture in which the roots of the tree feed," says the Wyoming Experiment Station. "Blasting enlarges the root pasture, breaks up the hardpan and subsoil and permits the roots to go down and get plenty of food."

Plant your fruit trees in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

—Eureka Stumping or Giant Stumping—which are made especially to meet Pacific Coast farm and orchard conditions. They pulverize the subsoil better than ordinary dynamites which often act too quickly and pack the earth.

Because the superiority of Giant Farm Powders is so generally acknowledged, other explosives are frequently offered as "giant powder." Insist upon having the genuine—always bearing the Giant brand.

Book "Better Orchard Tillage" Free

It tells and shows how to give your trees more pasture; how to blast for planting and how to increase the crops of bearing trees. Other books—on Stump Blasting, Boulder Blasting, Ditch Blasting and Subsoil Blasting for farm crops—are also sent free. Mark in the coupon the books that you prefer.

General Agricultural Review.

GRAINS, HAY, AND FIELD CROPS.

An Italian company plans to buy 5000 acres in Colusa county to grow rice.

Fall wheat has been tried out in Truckee Valley, Nevada, with very fair success.

Idaho, California, and Wisconsin are among the States that have seed potato inspection and certification.

About 500 acres have been signed for sugar beets around Stillwater and Fallon, Nevada, for a prospective factory.

A sugar beet 26 inches long, secured near Antioch, is held to indicate drought resistance as well as subsoiling activities.

Humboldt county reports one of the best potato crops in years. A little wire worm damage was found in the northern part.

Frost for three nights around July 20 in Truckee Valley, Nevada, proved to have injured potatoes only 15 per cent, mostly on low land.

Of 73 sandy acres planted to Sudan grass on one ranch in Butte county, 40 acres have recently yielded 2½ tons of hay per acre and the second crop is coming.

Some grain growers around Tracy claim that 50 per cent of their grain was broken off by the high winds and those who haven't pigs nor fences are feeling the loss keenly.

The first carload of seeds for this season was shipped to Michigan from Hollister Aug. 9. The seed crop is generally excellent this year in the Hollister and San Juan Valleys.

Around Manteca there are being harvested and shipped sugar beets from 6,000 acres. The crop is fine and growers are getting \$5.50 and better per ton. About ¾ of the crop goes to Spreckels and the rest to the Alvarado factory.

Spontaneous combustion of first cutting alfalfa mixed with bur clover kept a fire engine busy on the A. W. Morris ranch at Woodland until they got the hay out. Bur clover is considered bad to heat.

Beans are looking fine in Stanislaus county. Besides the Black-eye, Mexican Red and Pink beans, they are testing Red Kidney beans which are very promising also. Some Limas are planted as an experiment.

The Tagus ranch in Tulare county has three hay balers at work that are turning out an average of 60 tons of alfalfa hay a day. They are baling direct from the field, allowing it to lay in the windrow and shock from three to seven days, according to the weather.

An exhibit of cantaloupes at various stages of maturity, another showing effects of commercial and careful handling, and another showing the good effects of immediate icing is being displayed in Turlock by U. S. Department of Agriculture men.

The crop of sunflower seeds around Manteca this year will be fine. Last season that section shipped 1350 tons for which growers received \$60 to \$80 per ton. The crop is shipped to various cities where it is used principally in poultry foods.

The Stockton and Lompoc districts harvested 5,350 acres of onions in 1915 and planted 4,400 acres in 1916 according to the U. S. Department of Agriculture. New York figures are 12,551 and 9,389 respectively. Ohio and Indiana beat California this year but were far below California last year.

In the Livermore section, which usually produces about 20,000 tons of hay, the crop this season was only about 15,000 tons, but quality especially good. Practically the entire tonnage is out of producers' hands; part is still in storage. Prices to growers are \$13.50 for alfalfa and \$15.50 for wheat and oat hay.

Hay producers around Pleasanton have about all sold this season's crop. The hay is now in warehouses or has been shipped to the interior where there has been a good demand. The crop about Pleasanton was nearly up to the average and the quality was exceptionally good. Prices there now are about \$15 per ton for best hay; and dealers expect the price to go higher before spring.

In the Stanislaus section east of the San Joaquin, the oat and barley hay crop is heavier than normal, and quality good. Growers have sold 75 per cent of the crop, receiving \$11 to \$12 for the oat and \$9 to \$10 per ton for barley. Fully one-third of the crop has been shipped. The barley grain crop in that section was about normal; 800,000 sacks were received by growers to handle the crop. In the section known as the west side of the San Joaquin the hay crop is reported as being up to normal and a large part of it sold.

J. M. Bomberger is raising his own alfalfa seed this season north of Modesto. Last fall he plowed strips 3 feet wide in an alfalfa field, leaving a strip one foot wide carrying roots and crowns. In the plowed spaces he sowed barley and harvested a good crop last spring. After cutting the barley he cultivated the ground and now the alfalfa in rows is in full bloom. He expects to cut the crop and thresh it in September. Even if the seed costs him 50c per pound, Mr. Bomberger thinks it will pay; as he will know the seed and what it will do.

DECIDUOUS FRUITS.

The California Fruit Distributors have opened an office at Fresno.

Late frost did considerable damage to Truckee Valley apples and pears.

Ten carloads of California fruit recently sold in one day in Eastern markets for \$16,513.

Winters growers delivered the first dried peaches to the California Peach Growers Inc.

Many Humboldt apple growers will pack under the Standardization law this year.

The State Fruit Growers' Convention will be held at Napa Nov. 15-18, preceded by two days' meeting of county horticultural commissioners.

Fifty tons of peaches were canned Aug. 5 at the Hemet-San Jacinto Growers' Ass'n cannery. The season's tonnage is estimated at 1500.

Some 30 Kings county peach growers who sold to a Los Angeles firm are whistling for their money. About 30 carloads of fresh fruit are involved.

The Watsonville Apple Distributors have named the following f. o. b. prices on Bellflowers: 4-tier, 80 cents per box; 3½-tier, 75 cents; 4½-tier, 70 cents. Newtown Pippins will be coming next week.

The California Peach Growers Inc. have begun receiving fruit—over 800 tons were reported delivered before Aug. 13. Secretary Sunderland expects to be running full blast with 1000 men before August ends.

CITRUS, NUTS, SEMI-TROPICAL.

Oakdale almond harvest began about Aug. 8.

Almonds are looking fine in Wood colony, Stanislaus county.

The Santa Fe and Southern Pacific are making extensions into the Tulare citrus valleys.

Tulare county has 15,000 acres of bearing citrus trees and 28,000 acres non-bearing.

The Banning almond crop is being picked. It is estimated at 250 tons this year.

Fig growers in the San Joaquin valley are reported as selling their crop this season at 8c per pound.

THE LOS ANGELES TRACTION AND IMPLEMENT DEALERS' ASSOCIATION.

will hold their

SECOND ANNUAL TRACTOR DEMONSTRATION

September 19-20-21-22-23
PUENTE, CAL.

During this demonstration every Traction Engine sold in Southern California, and Traction-drawn Farm Implements, together with a complete line of Roadmaking Machinery, will be in operation.

This event will be the greatest of its kind ever attempted in the southwest. All arrangements are practically complete to entertain 20,000 visitors who will come from all points in the State.

This big tractor and implement show will be of educational value to every Rancher and Orchardist in California.

P-U-E-N-T-E

is near Los Angeles on the Main Valley Boulevard—is easy to reach from all points. COME—be with us on these dates.

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.

Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.
2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.
3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

John Deere Plows for Light Tractors

With High and Level
• Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

A Farm Book For The Asking

BETTER
FARM
IMPLEMENTS
AND
HOW TO USE THEM

A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152.

Write for your copy today.

John Deere Moline Illinois

No Pit

is required with the

Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 gallons per minute up to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

Irrigation on the Crocker-Hoffman tracts near Merced seems to be overdone, as much by seepage on some farms as it is reported underdone by lack of water later in the season on others.

The College of Agriculture of the University of California announces a free correspondence study course on "Lumber and Its Uses" to be given under the direction of the Division of Agricultural Education. This course, which is prepared by Prof. M. B. Pratt of the Division of Forestry, is planned to be of value to all persons having to do with lumber. It deals particularly with lumber produced on the Pacific Coast.

FISK

Non-Skids

The Best Tire Buy On The Market

THE Fisk reputation for Quality is the result of seventeen years of honest, painstaking manufacturing. Car owners who have been buying Fisk Tires during all that time buy them today because they have learned that they can depend upon Fisk Quality, year in and year out. They have learned that they can't buy more real dollar-for-dollar tire value. And this year they are getting greater mileage returns than ever before. Considering, too, that Fisk Tires with their heavy non-skid traction tread cost less than the plain styles of several other standard makes, there isn't greater tire value on the market today.

Fisk Service Quickly Available

More than 35,000 Fisk dealers and 125 Direct Fisk Branches make Fisk Service quickly available. Through your own dealer you are sure of the promptest attention of the Fisk Branch in your immediate vicinity. If you are handy to that branch make it a point to call there yourself—it doesn't matter whether you use Fisk Tires or not, you are welcome to Fisk FREE Service. Dismounting, inspection, inflation, assembling, mounting extras, inspecting wheels for alignment, advice on the care of your tires, and so on, all FREE. No charge to any tire user except for actual repairs and supplies—in any Fisk Branch. No other Tire Service Policy is so liberal or complete. No other Branch System is so extensive, or so handy wherever you may live.

Complete list of branches on request. Send for price list or call on nearest branch. Partial list below.

California's Thirst for Tractors.

(Continued from first page.)

machine-makers turned to serve farming to keep their plants engaged and their money busy. In 1856 the Mechanic Institute of San Francisco issued a circular addressed "to the mechanics of the State of California" earnestly hoping that mechanics generally will attend the State Fair "if only for the mutual interchange of ideas and views relative to the blending of the agricultural and mechanical interests for future exhibitions."

And three years later the announcement was publicly made that "the number of patents issued to Californians for inventions of the first magnitude is not less surprising than the mineral wealth of our mountains or the productiveness of our valley soils." This may seem to be putting it rather strongly and yet the records show that a decade later, in 1869, the patents issued to Californians and Oregonians in the one item of wheel plows, largely exceeded in number similar inventions from all other States of the Union combined.

Of course the recourse to capacious machinery for farming was stimulated by the scarcity of labor and the tremendous wage rate prevailing at the time. Evidently the economic secret of success was not in what a man could do with his own muscle but what he could direct by his touch—making forces not of his own physical body but of power and machinery do greater work of production than the old man-power agriculture could attain. The recog-

nition of this local condition is seen in the fact that the California teamster had more mules in front of him and more wagons behind him than teamster ever handled before: that the wagons had the large boxes and beds, especially made for California, and that the largeness of the wagon was reflected in the plows, reapers, headers, threshers, etc. And this was so prevalent that all Eastern manufacturers shipping to this coast had to make California styles for such trade. And all these things were eloquent not only of our necessities and opportunities, but they reflected the California conception that a California farmer was called to large work in the world.

Three Avenues Leading to the Tractor.—Analysis of the conditions prevailing from the very beginning of American occupation, and tracing the course of experience in meeting these conditions during the first half-century thereof, suggests that California reached the realization of the tractor by three avenues, not always distinct and separate, but sufficiently so for clear recognition. These avenues will be named: (1) the approach by the "steam-plow"; (2) the approach by the "steam-thresher"; (3) the approach by the "combined harvester." Inquiry into the history and development of each of these lines leads to the conviction that in all these avenues California mechanics, spurred on by California farmers, did work which must be considered original both in time and style; and in the line which

finally led through to realization, there was not only originality in beginning but achievement which has not yet been matched elsewhere in the world. It would require a volume to adequately set forth the prophetic utterances, and the efforts made to realize them, during the early years of California farming. Obviously, in this connection, only vistas can be sketched, here and there, through the three highways of progress which have been indicated.

The Thirst for Steam Plowing.—Although efforts at steam locomotion were first put forth abroad almost a century before California was industrially discovered, they all led to the realization of the railway and not to steam cultivation of the land. Priority in steam plowing is generally credited to the Fowlers of England, who patented their steam-plowing machinery in 1854 and ten years later gave a satisfactory working test of it at one of the Royal shows. Evidently steam plowing was in mind, at least, in California quite as early as the date of Fowler's patent, for the California Agricultural Society offered gold and silver medals, etc., for steam plows in 1858 and the committee in that year noted, with apparent regret, that "there were no cast or steam plows entered for competition." They evidently expected them and reasonably too, for they awarded premiums to "steel plows" and "gang plows" and "sub-soil plows," of local manufacture. The report of the committee was written by the late John Bidwell of Chico, who said, in 1866:

I cannot doubt that ere long steam or some other convenient power will

be made to perform the plowing instead of animals. Labor being dearer here than in any other part of the world, we must make up the disadvantages, under which we struggle, by adopting all the improvements in the form of labor-saving machinery. In this regard we are now certainly in advance and I believe will maintain the lead of all other nations.

And yet General Bidwell was really nearer to the beginning of steam-plowing effort in this state than he thought, for in 1858 there was exhibited "a traction locomotive steam car" of which the committee on steam engines reported:

We have carefully examined the "Leviathan Locomotive Steam Car" invented and constructed by Warren P. Miller of Marysville and find that it possesses great merit, being capable of transporting passengers and freight over any reasonable road and is also capable of being used to advantage in the agricultural business of the country in almost all cases where animal power has been heretofore used. Your committee believes it an invention which will change the entire aspect of things in transportation and other business of the country where power is required."

And to emphasize its conception, the committee awarded to Mr. Miller a premium of \$400.

But the realization of steam plowing was deferred not only here but elsewhere. In 1868, the late C. F. Reed, of Yolo county, said:

"The subject of applying steam to the tilling of the soil has attracted attention of inventors in nearly all civilized countries for years past, but a citizen of California is likely to be first to succeed in the accomplishment of this grand achievement."

At the State fair of 1868 a first

Single Standard Gopher or Drainage Plow

The only tool of this kind on the market for reclaiming marsh land or draining low grounds for beets and other crops. During the past season we have put out fifteen of these tools with excellent results in every case. We have a number of reports from the owners of large ranches stating that they have made thousands of dollars in one season by the use of this plow. THE GOPHER PLOW is bringing into use land that heretofore has been considered useless. If you have a problem of this kind, write us. We would be pleased to correspond with you regarding it.

The Killefer Manufacturing Company

2209-21 SANTA FE AVE.

LOS ANGELES, CALIFORNIA.

premium of \$300 and a diploma were awarded to Coffin & Standish of Martinez for the steam plow "Mayflower," and a model of a steam plow by Conrad Locher of Marysville was commended for "embracing more points of usefulness than any other plow." Mr. Locher subsequently built a machine, on the basis of his commended model, and in 1871 it was plowing on the Henshaw ranch, Hamilton township, Butte County, "at the rate of thirty acres a day, ten inches deep."

By this time (1871) there were several "steam wagons" in operation in California, doing some plowing, but more hauling of freight wagons, including heavy freighting to Virginia City, Nevada. Some were imported; others were of local manufacture. Space will not permit specific references to all of them. One of them was an imported machine called "Thompson's Road Steamer," on which local improvements were placed, and it then "plowed 25 to 30 acres a day at less cost than with horses, doing good work and cutting a strip seven feet wide." This was near Stockton, and the committee found quite an advantage in the fact that "it can tackle a felled tree in any part of the field and haul it out of its way as easily as a brush-drag." At the public trial it was awarded the first prize—\$50 and a diploma.

It was also in 1871 that Oliver Hyde & Son built in San Francisco their "American Overland Steamer," which surely had a romantic eastward career. At Sacramento "it hauled the three columns (50,000 lbs.) for the new State Capitol, and after this feat it loaded itself on a flat-car up a slope of 32 deg. and rode to Salt Lake, where it was put to work. It went by its own steam over the chief roadways in Utah and then started from Corinne for the mines, hauling a train of six wagons, one of which was built wholly of iron at Corinne and had a capacity of 20 tons of freight—a detailed account of its adventures being given in three and one-half columns of the Pacific Rural Press of Aug. 19, 1871. In the '70s and '80s probably not less than a dozen designs of traction engines were doing hauling, plowing, ditch and levee building, tule-hashing and other work here and there in California, but never coming into common use as a substitute for horse power. In 1872 Alexander Campbell prepared for the State Agricultural Society an essay on steam cultivation, in which he submitted an argument to show that hauling plows by cables is better than by direct traction and urged the introduction of the Fowler apparatus which worked with cables, back and forth from headlands, either with two traction engines or with one engine and an anchor. Several of these Fowler rigs have been brought to California at different times and have been used quite largely chiefly in connection with sugar-beet growing. But Californians have always believed in direct traction rather than pulling cables, and the tractors of the present day have justified this preference. It was a rational preference because during the dry season California lands will sustain even the heaviest traction engines and facilitate all kinds of work they can do;

and, for the softer soil of the rainy season, the tractors have been lightened and otherwise improved for going upon it. Thus the early era of development of steam plowing in California made its contribution to the final attainment of the tractor, but did not lead directly to it.

Approach by Way of Steam Threshing.—California achievements in substitution of steam for horse power in grain threshing led the modern tractor, although its contribution to the development of that mechanism was, perhaps, not large. It is interesting to note, however. In 1861, the first portable engine for threshing was built by Joseph Enright at Napa, after he had successfully run a separator by belting down from a stationary engine (made for a saw mill) the previous year. In 1861 also there were six portable engines for threshing imported from the East, but they were pronounced too small for the work. California-made threshing engines

gained in popularity for several years, and with straw-burning attachments became almost universally used in all the large valleys. In the '70s the rival builders were Joseph Enright of San Jose and H. W. Rice of Haywards. At the State Fair of 1877 four portable straw-burners were exhibited: two Eastern and two Californian—the award being to a California machine. All these were portable but not automobile. It was at a later date that the threshing engine evolved into a traction engine, moved itself and sometimes hauled its separator, cook-house and other paraphernalia, from place to place. Thus the portable threshing engine may be said to have grown towards the tractor.

Approach by Way of the Combined Harvester.—It is our opinion that the straightest route from the first ideas of steam-work, cherished by the California pioneers, to the modern tractor, is to be found through the evolution of the combined harvester. This is not the

fact everywhere, of course, for the use of the combined harvester is largely restricted to the grain fields of the Pacific states and a few other parts of the world which have secured them from California manufacturers. The historical succession in California is however quite clear and interesting, and the present widespread disposition to tractor-farming in this State has certainly been fostered by the achievements of the combined harvester.

The combined harvester is not as new a thing as is commonly thought. The inception of the idea dates to the first American decade, for at the fair of 1857 a diploma was awarded to Mr. Verrell (or Mr. Vevill, for the report gives both names) of Stockton for a model of a "harvester and thresher combined" and the report says "it shows one more step in inventive progress toward this desirable result, though its real usefulness has yet to be tested"—leaving the impression that even this early record is not the first.

Make Your Own Comparisons

You have read tractor advertisements—you have studied tractor catalogs. Now, at the State Fair, you may see the machines engaged in actual work. Compare them there, side by side.

See how far superior the Caterpillar is, in construction and design. Note its ease of handling, its simplicity, its complete accessibility. Study the features that made this tractor Grand Prize winner at both 1915 Expositions. Learn how motor power is turned into pull, in the Caterpillar, with least frictional loss—how soil packing and miring are made impossible.

Then Make This Further Test:

We know you will be convinced that the Caterpillar is superior if you compare it, point by point, with other tractors. But still surer proof of a tractor's merit will be found in talking with the owners and operators of the machines.

Caterpillar owners will tell you that this tractor is built for service, that it will work in any season, regardless of weather or ground conditions, that its fuel and upkeep costs are light.

There are more than 1200 Caterpillar owners in California alone—let us give you the name of the one nearest you. Or, if you haven't read the Caterpillar Catalog, send for it today.

**WINNER
GRAND PRIZE**
At the Panama-Pacific Exposition and at the San Diego Exposition, the Caterpillar was awarded the Grand Prize—highest possible award. Only one Grand Prize was granted in each class.

In 1866 R. F. Cook of Napa received a diploma for a model of a "steam harvester, separator and thresher—to be hauled through the fields by animal power while the machinery is worked by steam."

In 1871 at the Mechanics Fair in San Francisco there was shown "one of Howell & Low's famous headers and threshers which cuts, threshes and sacks the grain as it moves along through the field," and it is also stated that "it is expected that Oliver Hyde (who has a contract to put in 2000 acres of land with grain in Sutter county with one of his successful California Road Locomotives) will gather the grain with one of Howell & Low's harvesters." If that was done, it constitutes the earliest record we have thus far discovered of a combined harvester and traction engine at actual field work in this State.

In 1870 a premium was awarded to Matteson & Williamson of Stockton for a combined harvester operated by animal power, and of this machine the President of the Society, the late C. F. Reed, said in his opening address of 1871:

Machines have been recently invented and manufactured in this state, each of which with only three men and a team, is capable of cutting, threshing, cleaning and sacking 30 acres per day of wheat that will yield 40 bushels to the acre. There is in California a wheat grower who has 60,000 acres (25 square miles) in a single patch. With ten such machines he could harvest his crop in two months. Ten men, working with old-fashioned cradle rake and hands, would consume five years in harvesting the same amount of grain.

And yet it was about a decade before combined harvesters began to get really busy. D. Houser in 1882 secured a premium of \$75 at the State Fair and a gold medal at the Second District Fair for his "combined header and thresher" which the committee called: "the most valuable labor-saving machine in California." In 1883, L. U. Shippee entered the manufacture of harvesters and made things hum in his characteristic way for several years, during which awards of \$250 prizes and gold medals were freely made. The Shippee, Powell, Minges, Houser, Young and other types were exhibited for several years in competition until the Society wearied of paying such large premiums, and then the machines were shown for several years without competition. In 1887 the Holt Combined Harvesters were first noted at the State fairs. In 1888 the Board of Agriculture said in its annual report:

Our Combined Harvesters that cut, thresh and sack at one operation, enabling the farmer to market his grain on the day of ripening, if needs be, illustrate the spirit that predominates in our wide-awake California farmer."

Whether the operation of a combined harvester and traction engine was realized in 1871, as noted above, or not, the writer of a report in 1889 was so impressed by the fact that the great combinations of the third decade were still operated by droves of horses or mules that he indulged in this outburst:

The novelty of the combined harvester has hardly worn off before we were shown a practical and powerful motive power to draw it. The traction engine is shown perfected to a degree of usefulness not heretofore attained. It is the invention of Daniel Best and its use was

demonstrated by a test before a committee and the perfect ease with which it handled a gang of twelve plows in dry soil was noticeable. It also drew a combined harvester with the same apparent ease.

This achievement induced the State Board of Agriculture to return to premiums for combined harvesters, and in 1891 there were entries by five California manufacturers and the prize of \$100 and a gold medal went to Daniel Best for his "combined harvester with steam power." At the same fair Mr. Best was given a premium of \$50 for "the best vapor or gas engine."

And this fact brings us to the period of the modern tractor, as based upon the use of an "internal combustion engine"—and to the end of the space which we can conveniently give to the subject at this time. It has not been our purpose to present views of the tractor but to merely sketch in a California background upon which, at least in this State, this greatest achievement of modern agricultural machinery must be pictured.

We may now claim to have sustained our thesis that the thirst for the tractor was an aspiration of the

California pioneers, and that they worked diligently and connectedly toward its attainment: and we may, perhaps, also fairly claim that the farmers and mechanics of no other single State have contributed more to this attainment, during the last quarter of a century, and to the popularization of it not only in this State but in various parts of the world.

Many Bull Tractor owners are burning half kerosene and half gasoline without changing their carbureter equipment.

26 Extra
Features

Mitchell
MID-YEAR
MODEL

\$1325
F. o. b. Racine

John W. Bate's Surprise

This Mid-Year Mitchell came out in April as a nation-wide surprise.

It combined in one car all the best new conceptions found in 257 Show models. It embodied 26 extra features, most of which all other cars omit.

Yet it sells at a price which is way below other cars of its size and class.

But what you see here is the final result of 13 years of effort. John W. Bate, the efficiency engineer, has devoted those years to the Mitchell. The car which amazes you today has come through that evolution.

The Extra Values

You see here extra values. You see the most complete car ever shown. You see many costly features, exclusive to the Mitchell. And you wonder how we give them at our price.

The reason lies in factory efficiency, due to Mr. Bate. He has built and equipped here a model motor car plant. He has, in six years, cut our factory cost in two.

We now build in this plant, by his up-to-date methods, 98 per cent of this car. And all of the extra values we give you are paid for by factory savings.

700 Improvements

But Mr. Bate, in those years, has done more than you see. He has worked out in the car over 700 improvements.

Under his direction, every part has been studied. And every part brought to perfection.

Castings have been practically eliminated. He employs drop forgings and steel stampings to make lighter, stronger parts. There are 440 such parts in this Mitchell.

He gives you big margins of safety. There are oversize parts

where the strain comes. There is much Chrome-Vanadium steel.

He has aimed at a lifetime car, enduring and trouble-proof. Six of his cars, as a result, have averaged 164,372 miles each. That is over 30 years of ordinary service.

That's the sort of car that wise men want when they buy a car to keep.

Added Luxuries

He has given you a car big, roomy and powerful, yet very economical of fuel. For ease in driving he has given you a new type of control. He has given you ball-bearing steering gear, an engine primer at the driver's hand, a power tire pump, etc.

For easy riding he has given you Bate cantilever springs, 52 inches long.

He gives you a 22-coat finish, deep, rich upholstery, a light in the tonneau, a locked compartment, and many unique appointments.

Those are results of efficiency. They would be impossible at the Mitchell price without this model plant. And such a car would be impossible without a John W. Bate.

That is why so many big men are buying Mitchells now. Many engineers—men of nation-wide fame—have lately bought the Mitchell. Thousands of business men select it. They know what efficiency means.

You will want this car when you know it. You will want its attractions, you will want its endurance. Let your nearest Mitchell dealer show you in how many ways it excels. If you don't know who he is, ask us for his name

Two Important Price Reductions
Two Interesting New Models

The New Four-Cylinder, 3-passenger Reo Roadster, \$875

The New Reo the Fifth, "The Incomparable Four," \$875

The New Four-Cylinder Reo Enclosed Car, \$1025

The New 4-passenger Reo Six Roadster, \$1150

The New 7-passenger Reo Six Touring Car, \$1150

The New Reo Six 7-passenger Sedan, \$1750

1500-pound Reo "Speed Wagon," \$1000

2-ton Reo Truck (Chassis only, with Driver's Seat and Cab), \$1650

(All Prices are f. o. b. Lansing, Michigan)

YOU WANT TO KNOW—everybody always wants to know—what models Reo will make the coming year, and the price of each.

OF COURSE THERE ARE NO NEW MODELS—new chassis models we mean. You do not look for, do not expect, do not want new chassis models from Reo.

THAT ISN'T THE REO WAY. Refinements—of course. Detail improvements—wherever and whenever we can find a place or a way to make them.

NOTHING RADICALLY NEW is ever offered to Reo buyers. For it isn't new when it gets to you—it has been thoroughly tried and conclusively proven before we let it get into a Reo car.

NEW BODY TYPES—YES—and some that put Reo in the highest class of cars in looks as well as in performance and longevity. We'll treat of each in turn.

REO THE FIFTH COMES FIRST, of course. First not only among Reos, but among motor cars.

FOR THIS IS THE GREATEST automobile ever built, we verily believe.

THIS IS THE SEVENTH SEASON that Reo the Fifth has been standard in practically its present form.

NO: THE PRICE WILL NOT BE CHANGED this season. We will not increase—we cannot lower it.

ACTUAL COST OF MAKING is now more (\$50 more) than when the present price, \$875, was set a year ago. And we had made this model so long; had so refined and perfected manufacturing processes; had reached such a high state of efficiency in production; and cut dealers' discounts so low that we had, then, reached rock bottom.

IT WAS AN ACHIEVEMENT of the first magnitude to produce such a car and sell it at such a price—\$875.

TODAY YOU SEE OTHERS increasing prices all along the line. They must do so. They have no choice.

ORDINARY BUSINESS RULES dictate that we also "tilt" the price of Reo the Fifth \$50 at least.

BUT REO PRIDE PROMPTS that we absorb the extra cost, as we have for months past, and keep the price where it is until conditions will, happily, return to normal.

THE FOUR-CYLINDER ROADSTER—same wonderful chassis, same price, is the smartest thing on wheels—the most popular car in the world among physicians, and all professional and business men. Also \$875.

TO SUPPLY A GROWING DEMAND for an enclosed body on Reo the Fifth chassis, we have planned to build a limited number. The quality will be Reo—which is to say, excellent. The top is rigidly supported at front and rear. Removable glass panels convert it into a veritable limousine for winter, and these discarded and with Jiffy curtains (which are also furnished) it is an ideal summer touring car. The price is \$1025.

THE NEW REO SIX will continue in its present popular forms—the 7-passenger touring car and the classy 4-passenger roadster; and we will make a limited number with Sedan bodies to supply an insistent demand for this type of body on this splendid chassis.

THE PRICE IS REDUCED \$100 on the 7-passenger and roadster models. Now \$1150!

NOW YOU WONDER, and naturally, how we can reduce the price of the Reo Six models and not the Four—especially after what we have just told you about the increased cost of production.

SEEMS ILLOGICAL at first blush—doesn't it? But it isn't. For the truth is never illogical. And the truth is that despite the present higher prices of materials and labor still it costs us less to make this six-cylinder model than it did a year ago.

BY THE WAY—there's the greatest possible example of the workings of the Reo plan and its beneficence to buyers. Listen!

REO THE FIFTH SOLD FOR \$1250 in 1912. Its price was reduced by successive stages from year to year as follows: \$1175, \$1050, and now is \$875 f. o. b. Lansing.

SAME CAR?—No—an infinitely better car—for each year we have incorporated refinements and added equipment as the art has developed.

AND WE TOLD YOU EACH YEAR the reason for the reduction—that we had absorbed a portion of the initial—experimental, tool jig, die and special equipment—cost, and were giving you the benefit.

THIS POPULAR REO SIX is now in its third season. It has passed the same stages through which its great four-cylinder namesake went—initial costs have been absorbed, charged off. And in accordance with that unswerving Reo policy we give the buyer the benefit and set the price at \$1150 f. o. b. Lansing.

WE WILL MAKE A LOT MORE of those 4-passenger Six Roadsters the coming season. We underestimated the appeal and the demand for this model. It proved one of the most popular Reos ever built.

THE SIX SEDAN speaks for itself, though, truth to tell, an illustration does it scant justice.

YOU MUST SEE IT where you can study its artistic lines and faultless finish to fully appreciate this latest Reo which we price at \$1750.

NOW A WORD ABOUT THE TRUCKS since 90 per cent of all Reo automobile distributors also handle Reo motor trucks.

PRICE OF THE 1500-POUND REO "Speed Wagon" has been reduced to \$1000.

SAME REASON—SAME POLICY—reduced cost of manufacture despite higher present cost of materials—as enunciated in speaking of the Reo Six.

AND THAT TWO-TON REO. What shall we say? What need we say? We submit, it is the greatest 2-Ton motor truck in existence. Has been standard for longer. Has given greater proof of its sturdiness and efficiency and low cost of upkeep.

IF WE ARE TO JUDGE by that over-demand, we may well assume that we could sell all that we could make were the price \$2500, instead of \$1650.

AND FINALLY A WORD about the big general plan—a brief reiteration of the Reo policy.

WE STILL ADHERE to our determination never to make more Reo cars or trucks than we can make and make every one good.

TEMPTATION IS GREAT of course. Dealers protesting, buyers begging for more Reos. But we know—we know—on what solid foundation this Reo success was built; and we'll jealously guard that policy to the last.

RIGHT NOW—AUGUST—there are more orders on hand at the factories than at any previous time in Reo history. Orders hopelessly in excess of factory output—and that also is greater than ever before.

AND RIGHT NOW Reo stands higher in the esteem of buyers and of the trade than ever before.

\$30,000,000 PER ANNUM is not small by any means. Reo is in fact, one of the largest in point of production. We have no ambition, however, to be the largest. Don't want to make all the automobiles—only the best.

RATHER THAN INCREASE the quantity we shall strive always to improve the quality so that, as the art advances and cars generally improve, still Reo will continue to be known as—"The Gold Standard of Values."

Good Enough for Any Herd

AGGIE GRACE PONTIAC CREAMELLE
Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Klondyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915. Write or call and see the herd.

Breeder of high-test Holsteins.

HOG CHOLERA ITS OWN PREVENTION

WE TEACH THE HOG RAISER FREE, HOW TO VACCINATE THEIR HOGS.

READ THIS LETTER:

Mr. L. B. Green, Mgr.,
Inter-State Vaccine Co.,
Los Angeles, Cal.

Dear Sir: This will acknowledge receipt of 2,200 cc of your Hog Cholera Serum for which I wish to thank you for such prompt delivery.

We have been using your serum and virus the past year on more than 500 hogs, and can truthfully say that we never have had such good success in vaccinating for hog cholera as we have had with your medicine. We have tried other serums and virus but have had poor success. With yours we have not lost more than 1 or 2% and in all these cases it has been partly our fault.

I wish I might impress the hog raiser that vaccination for this dread disease among hogs is the only sure and successful way to insure success. It costs so little and gives absolute immunity against cholera that it is the best insurance to be had and anyone raising hogs should not do without it.

I am more than pleased that you have a branch here in Los Angeles where we can get our serum any day without sending East.

Yours very truly,

SAN GABRIEL LIVE STOCK CO.,

COST OF BUTTERFAT.

To the Editor: As marketing Agent of the Farmers Union of this county, I am working on the proposition of better prices for butterfat and as a basis for my investigations I want to know what it actually costs to produce a pound of butterfat under the following conditions: Alfalfa \$10 per ton, land \$300 per acre (with improvements), cows giving 300 pounds of butterfat in one year. These cows worth \$125 each. Water and land tax \$4 per acre, salary of farmer \$1000 a year, 20 acres of land capable of keeping 15 cows, 2 horses and young stock. One man being able to care for 15 cows and provide hay, etc. I would not figure in concentrates, for the majority of farmers do not feed them and they would complicate the problem and we have many cows of the above standard fed only on alfalfa. (Of course this is not the best way, but it is done). I think you should figure about 7 per cent profit on the man's investment. His tools would cost about \$500; his team \$250, etc. I think I have given you about the necessary data for a fair estimate. I have figured it myself but desire more competent authority than my own.—O. L. L., Modesto.

[Answered by E. C. Voorhies, University Farm, Davis.]

[I would like it clearly understood that I am not setting down the cost of butterfat as figured by myself or the University. On the basis of the querist's figures, my solution of the problem would be as follows]

Stock and Equipment:
20 acres of alfalfa at \$300 per acre \$6,000.00
15 cows at \$125 each 1,875.00
Implements 500.00
One team of horses 250.00
One bull 250.00

A total investment of \$8,875.00
Yearly Expense:
7 per cent on \$8,875 \$ 821.25
Water and land tax at \$4.00 per acre 80.00
Salary of the farmer 1,000.00
Depreciation on horses, implements, and bull at 20 per cent 200.00
Depreciation on cows at 5 per cent 93.75

Making a total yearly expense of \$1,995.00
Income Other than Butterfat:
15 calves at \$8.00 \$ 120.00
1200 cwt. of skim milk at 25c per cwt. 300.00

Making a total income other than butterfat \$ 420.00

The \$1995 minus the \$420 will leave \$1,575, the cost of producing 4500 pounds of butterfat. This will make the cost of lb. of fat 35c.

I would like to call attention to certain facts in these figures which I do not think are correct, and would have to be changed somewhat. There has been nothing allowed for depreciation on the buildings. I am allowing rather a low figure for the depreciation of cows also. Five per cent probably would be all right theoretically, but I am not allowing anything for the loss of a cow now and then, which would amount to a considerable sum of money. Neither are we allowing anything for veterinary services and miscellaneous items which often come up, especially on a dairy farm. The figure, \$8 for each calf is, if anything, high, and although 25c. per cwt. for skim milk is a fair price, still a good many people figure only 20c. If anything the cost of one pound of fat, according to the figures given by the querist, is low.]

All this spring's pigs in all the litters raised at Winona Ranch that have yet reached the age of four months have averaged at that age 99.5 lbs. per pig, counting all pigs raised in all litters. The Laurel Champion litters out of Miss L. 2nd, Masters Lady Premier 5th, and Princess Royal S. averaged 110.6, 101.4, and 101.1 per pig at this age.

"On July 1, 1915, there was a total of 211 cow-testing associations in U. S.," is a quotation from a Dairy Handbook being distributed by the De Laval Co. of San Francisco. It

Don't Delay buying a DE LAVAL SEPARATOR a single day longer

IF YOU ARE SELLING CREAM or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

THERE CAN BE ONLY TWO real reasons for putting off buying a De Laval; either you do not really appreciate how great your loss in dollars and cents actually is, or else you do not believe the De Laval Cream Separator will make the savings claimed for it.

IN EITHER CASE THERE IS one conclusive answer: "Let the local De Laval agent set up a machine for you on your

own place and SEE FOR YOURSELF what the De Laval will do."

YOU HAVE NOTHING TO RISK and more than a million other cow owners who have made this test have found they had much to gain.

YOU CAN'T AFFORD TO WAIT till next spring or even for another month. Let the De Laval start saving cream for your RIGHT NOW and it will earn its cost by spring.

SEE THE NEAREST DE LAVAL agent at ONCE or if you do not know him write us direct for any desired information.

WOODLAND, CAL.

is full of articles written by the most competent authorities on all phases of dairying, including 44 sample balanced rations.

R. F. Guerlin of Visalia will consign several fine A. R. O. cows to the annual sale of the California Holstein Breeders' Ass'n at Hanford.

Culling Out the Purebred Scrub.

[Written for Pacific Rural Press.]

Anyone who understands the purebred livestock industry, realizes that notwithstanding the admirable efforts of the record associations, the reputation of each breed rests entirely with the individual breeders; and be it said in their favor, breeders very seldom knowingly do anything to damage their breed.

This is not perhaps due to breeders as a whole being more straightforward than other classes of farmers, but to the fact that experience has shown that the man who breeds purebreds must always deal squarely with the public if he values his business reputation.

And so we find successful breeders going to extreme lengths to satisfy a customer, often losing money by so doing, but standing it cheerfully rather than have any shadow of suspicion cast on their reputation.

As most sale controversies start over differences in opinion concerning the animals sold, those with selling experience invariably are free users of the knife on young stock not representative of the breed.

That much harm to the purebred industry is accomplished by a lack of knowledge of what are representative animals is shown by the question of a new hog breeder recently in the writer's presence. He said: "What I need is to have somebody come out to the ranch and show me where my hogs are defective. I would welcome such advice, for while I have raised hogs all my life I confess an ignorance in selecting breeding stock that is good enough for herd sires. I don't expect 100 per cent of good ones in every litter, but I'm blamed if I can tell which ones to use the knife on."

Probably nine-tenths of all the poor specimens that are sold can be directly attributed to breeders who have not realized, as has this man, their shortcomings in knowing which animals to use the knife on, acting under the misapprehension that a registration certificate is sufficient evidence of an animal's worth.

Experience, of course, teaches them otherwise; but it is expensive experience, inasmuch as the buyers of such animals as should have gone into the fattening pens are dissatisfied customers; which, as we have said, successful breeders go to great lengths to prevent.

When entering the breeding fraternity, every man should understand that a certain percentage of his purebreds will be purebred scrubs. What percentage he should expect to come under this heading will depend to a large extent upon the care he has used in selecting his foundation herd. One prominent hog breeder of our acquaintance has been working to diminish his percentage of purebred scrubs for eight years; and

by careful selection has reduced it from 25 to 12 per cent. It would be interesting and decidedly advantageous to the new breeder as well as to the industry if those having had experience would let the public in general know how many males out of every hundred they deem suitable for breeding purposes.

VACCINATING YOUR HOGS.

To the Editor: Is there any law or any good reason to prevent an ordinarily intelligent hog grower from vaccinating his own hogs for cholera?—Sub.

[L. B. Green of the Interstate Vaccine Co. says:

"There is nothing complicated or hard to do about vaccinating hogs. With the graduated syringes, the amount of serum can be accurately ascertained and the injection is a trifling operation. Any apt person can do the work.

"To drive out this dreaded disease, we are believers in two things—vaccination and sanitation. One without the other does not reach far enough, but where both are applied, success crowns the man handling hogs.

"Commercial plants having Government licenses, since the beginning of 1914, have been producing serum which is a positive preventive of hog cholera."

Dr. H. B. Wintringham of Petaluma says:

"It is all right for such a person to give the serum-alone treatment. It is very dangerous for such a person to give the simultaneous treatment; for unless he is trained in the production of this vaccine and the various processes by which it gives immunity, it is more than probable that such a person will spread cholera all over the community. There is no law to prevent his giving it, however."

We would say in addition that it would be permissible. If you are willing to learn the nature and dangers of vaccination, scrub and disinfect the hogs' skin where injected, quarantine vaccinated hogs, and disinfect hands, clothes, and shoes after handling such animals.]

CONCRETE BARN FOR IMPORTED GUERNSEYS.

[Written for Pacific Rural Press by Bert S. Wolf.]

Another purebred Guernsey establishment is replacing a grade-cow dairy near Napa. B. E. Nixon, son of former Senator Nixon of Nevada, recently bought the big ranch and had installed 40 purebreds the month previous to this writing. All had been imported from Guernsey Isle. Milk from these, tested at Davis University Farm, averaged 4.5 per cent fat.

Mr. Nixon expects to increase the herd to 250. He is building one of the finest concrete barns in the county or State, a special feature being the floor of pressed cork brick. It is 161x37½ feet, built for 80 cows. A five-ton ice machine is to keep milk and cream cool. He is raising Indian corn for the large silo already erected, and there are 100 acres of pasture. Visitors are not allowed in the barn for an hour before and after milking; and attendants must take a shower bath before each milking.

When hogging off grain, keep a self-feeder full of tankage.

DAIRYING AND DAIRYMEN.

W. J. Hackett of Ceres will show eight Jerseys at the State Fair.

The Madera Co-operative Creamery sold out Aug. 5 to K. H. Mulder of Cottonwood for \$10,000.

G. Outland of Modesto reports twin Holstein heifer calves from Bosma of Riverside by Hermania Ignaro.

The Carpenter Cheese Co. of Salida claims the largest daily production (2500 pounds) of any cheese plant on the coast.

The McClure Cattle Co. of Glendale, Ariz., shipped two cars of high-grade Holsteins to Arizona from Modesto Aug. 11.

E. E. Freeman of Modesto reports the sale of three registered Holstein bulls to Phoenix, Arizona. He says Pacific Rural Press did it for him.

The Oakdale creamery has completed an addition to buildings and equipment, so they think they can handle three tons of butter per day.

The Merced County Cow Testing Ass'n has been organized by business men of Merced who expect to canvas the dairymen for membership.

Queen Piebe Mercedes, owned in Minnesota, has broken the record for fat production in the junior four-year class by producing in 365 days 30,230.2 pounds milk.

W. Lloyd Merrill of Colusa has bought the bull Sir John Ormsby from B. D. Scott of Lemoore. This bull is a grandson of Duchess Skylark Ormsby, the champion fat producer.

Butter in storage reported by 111 firms in the United States Aug. 1 totaled 87,036,029 pounds. Holdings of 101 of these were 71,349,813 pounds as compared with 68,578,320 a year ago.

Over 500 registered Holstein cattle will be sold at the various auction sales to be held in the State during the next two months. This number is less than that of last year but last year's sales were spread over a longer period.

According to Manager Murphy of the Dairymen's Co-Operative Creamery at Tulare, over 90 per cent of their patrons are now cooling their cream and nothing but sweet cream is being received, even though the weather is very trying.

Practically no butter is being manufactured in Los Angeles, except a small amount from the sweet milk and cream "come backs." All of the dairies tributary to that market are either producing whole milk or cream for retail consumption.

Alfalfa hay is selling at \$15 to \$16 baled, in Southern California dairy districts. That section is drawing heavily upon supplies in other

parts of the State, and nowhere from Fresno south does one see much hay being held by the grower.

According to S. A. W. Carver of Los Angeles, there have been approximately 50 silos erected in Southern California, exclusive of Imperial Valley, during the past two years. He states that fully 20 per cent of the land in the Artesia district is planted to corn this year.

The City Board of Health of Los Angeles has recently put into effect their milk scoring system, whereby the milk from every dairy supplying that city with milk is scored and the score published in the daily papers, thus acquainting the consumer with the good and poor brands of milk.

Walter Mitchell of Visalia will consign a few of his choice Holstein cows to the California Holstein Breeders' annual sale at Hanford. Mr. Mitchell has been breeding registered cattle for a number of years, but this is the first time he has participated in any of the Holstein sales. During the past year he has made several very creditable A. R. O. records.

For the first month of the new Orland Cow Testing Ass'n, the following are the best records:

Owner	Milk per day	% fat	Lbs. fat per day
A. H. Bangham	45.5	4.5	2.04
J. O. Bentz	35.2	5.3	1.86
M. S. Holt	44.3	4.1	1.82
C. W. Curtis	47.3	3.8	1.79
J. B. Hann	44.5	3.9	1.73
G. J. Hiller	37.3	4.5	1.67
J. M. Christianson	37.0	4.3	1.59
W. M. Downen	31.3	5.0	1.56

SWINE BREEDERS AND STOCK.

Elmer Lamb of Ceres will exhibit 18 purebred Duroc-Jerseys at the State Fair.

In the Carruthers Sale Steybrae Laurel 2nd was bought by the Butte City Ranch instead of by Mark Regua as noted in our report.

The Stanislaus Poland-China Ass'n invites the Kings County Poland-China Ass'n to attend the sale at the Livestock Show and Exposition at Modesto.

Biddle and Russell of Hanford bought the 12 carloads of 1000 hogs mentioned in last week's issue as having been shipped by one firm to one packing company (the Western Meat Co.) one day last week. They paid 7 and 7 1/2 cents f. o. b.

A Los Angeles packing house has recently sent a representative to Tulare county to buy hogs direct from the farmers, instead of through a commission buyer as has been done in the past. Practically all of the hogs in southern California are now being bought by the packers direct.

Peters, Lamson and Walker received their last shipment of regis-

LIVESTOCK DIRECTORY.

SWINE.

BILLIKIN HERD OF IMPROVED CHESTER WHITES—The kind that makes money. Purebred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEYS—All ages. We have produced hogs weighing 240 lbs. at 7 months, at a cost of 3 1-10 cents per pound, including pasture, grain and upkeep of sow. If you want some of the kind it pays to raise, we would suggest that you order immediately, as our spring stock is going rapidly. Haden Smith, Woodland, Route No. 1, Box 84D.

BERKSHIRE BOAR—Son of Star Value, Value Bachelor 137,554. Dam Lady Bachelor 5th. Six years old, weighs 700 lbs. in light breeding condition. Active. Excellent sire, \$65. Registered pigs sired by above and Wills Masterpiece 210,102, \$15. Trios, \$40. W. H. Waugh, Riverside, Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapeville Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

NOW IS THE TIME to breed for Fall litters. I have a choice lot of young boars ready for immediate service. Also bred sows, bred gilts, weanlings of both sexes. Attractive prices will be quoted for quick sale. Geo. A. Smith, Corcoran, Cal.

BERKSHIRES—Herd headed by Artful Masterpiece and Improver B, Grand Champion at California State Fair, 1912 and 1913 respectively. Open sows, service boars and weanlings for sale. Oak Grove Dairy Farm, Box 1, Woodland.

DUROCS from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy, with fine backs and deep cherry color. We sell only those we'd like to keep in our herd. Don't write us if you want cheap stock.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

FOR SALE—Registered Hampshire Hogs—P. I. E. stock. 1 sow, 2 years old; 1 sow, 14 months old; 1 boar, 16 months old; 5 females and 1 male, 2 months old. F. J. Costello, Los Altos, Cal.

HAMPSHIRE SWINE—Fancy belted boars and sows. Good ones, \$25 and \$20. Better ones up to \$45. All registered. Ben F. Thorpe, Manager, Canfield Estate Ranches, Bonaparte, Cal.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

LARGE, QUICK MATURING registered Berkshires—Both sexes, \$10 each for weanlings. Older ones at farmer's prices. J. H. Bombberger, Modesto, Cal.

REGISTERED PUREBRED BERKSHIRE PIGS—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Registered stock of all ages. Prices and description on application. E. J. Merrill & Son, Moraga Hill.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

FOR SALE—150 head stock hogs. Will weigh from 75 lbs. to 160 lbs. Good, thrifty condition. A. H. Armistead, Wheatland, Cal.

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

POLAND CHINAS—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Linview, Route A, Modesto, Cal.

STOCK HOGS FOR SALE—Good bunch, 85 head—50 to 175 lbs. Berkshire foundation. M. D. Keyser, Brentwood.

FOR SALE—Thoroughbred Poland Boar six months old. Weight 185. Perfect type. R. T. Brown, Burbank.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs, \$10. H. E. Rondier & Son, Napa.

30 REGISTERED BERKSHIRES—Boars and gilts for sale. J. H. Benedict, Lemoore, Kings county.

tered Durocs August 11 from Iowa. These, as well as several other outstanding young animals, were purchased by Mr. Walker while on a recent trip East where he selected from the best breeders' herds in the country.

BEEF, SHEEP, HORSES.

A shipment of 2000 lambs left Oregon for San Francisco Aug. 10.

The Whitehall Estates will show Percherons at the State Fair.

Bear have driven Ralph Friend and his sheep from Bond Canyon above Porterville.

A bunch of Hot Springs people, including Mr. Hockett, Mrs. Helmerigh, Will Atkins, Miguel Gill, and J. F. Moody shipped about 300 cattle to Terra Bella this week.

That the demand for purebred Angus bulls is increasing in California is indicated by the sale of over 30 such bulls during the past season by the Tagus ranch of Tulare.

Joseph Corey and John Burrell have recently shipped three carloads of cavalry and artillery horses and mules from Hanford for European battlefields.

Miss Frances Howard has made arrangements to trade \$80,000 worth of stock in the Howard Cattle Co. for a ranch near Merced owned by her brother, now of Boston.

There are about 40,000 beef cattle in Imperial Valley at this time according to those familiar with the situation there. Feed is short on account of the recent ditch troubles.

Thirty-six carloads of sheep were recently expected in San Francisco from Ed Waltz and H. H. Haile of Stirling City. Sixteen carloads were shipped last week.

Over 1000 cows are now entered in the Kern County Cow Testing Association; and while the association was but recently organized members are finding it of decided value.

GENERAL LIVESTOCK.

Riverside Fair Oct. 10-14.

Humboldt County Fair, Ferndale, Sept. 5-9.

The Jerseydale Fair (Mariposa county) will be held Sept. 8-11.

Fred Maddalena of Petaluma recently bought a 170-acre ranch near Cloverdale and will engage in livestock.

Residents of South San Joaquin irrigation district are combining in an effort to hold a big community fair at Ripon, Sept. 15 and 16.

Secretary Dakin anticipates the largest number of exhibits and best all round fair for Pleasanton next month that has ever been held by the Alameda County Fair Association.

FAIRS AND GENERAL LIVESTOCK

Fresno county livestock was reported Aug. 1 by Livestock Inspector J. F. McKenna to be generally healthy except for hog cholera.

R. L. Foster has leased the 400-acre cattle-sheep-and-hog ranch known as the Mary Wilson place near Modesto.

United States is reported to be the greatest meat eating and meat producing nation in the world. In the fiscal year 1914-15 we imported more beef and mutton than we exported.

At a recent meeting of the Napa County Livestock Ass'n, State Controller J. S. Chambers said that the State owns nearly \$300,000 worth of livestock besides the University Farm Herds.

President T. W. Fowler of the Merced County Fair Ass'n has appointed W. H. Robinson as the committee on by-laws and organization. Canvas will house the exhibits this year Sept. 19-23, and double last year's space will be available.

According to County Livestock Inspector Griffith of Kings county there have been no cholera outbreaks for over two months in that county and at the present time there is no contagious disease known in the herds or flocks of the county.

"Jackson MADE"

Write for Catalog No. 47 F

A Better Made Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

STOCKTON, CAL.

The Latest on Infectious Abortion.

[By Ward Giltner and E. T. Hallman of Michigan Agricultural College.]

A common way in which the disease is introduced into the herd is through the purchase of an affected female animal.

Food or water soiled by the discharges of an affected animal may convey the disease to healthy animals.

The bull may convey the infection from one cow to another.

Not all abortions are known to be infectious.

There are no known symptoms by which we can always differentiate between infectious abortion and abortion due to other causes.

Through a blood examination we are apparently able to determine whether the abortus bacillus has affected the animals of a herd.

The blood examination will not determine whether an animal will abort, as not all affected animals do abort.

Sterility frequently follows abortion. If this can be prevented by local treatment subsequent pregnancies will usually terminate normally.

In the hands of an experienced operator sterility may yield to special treatment.

An animal may harbor the infection for years without aborting. Such animals are dangerous to susceptible animals in the herd.

We have not been able uniformly to prevent abortion by the use of bacterial vaccines.

Carbolic acid is the principal constituent of some of the most widely advertised so-called abortion cures, but our experience with carbolic

acid has not been entirely satisfactory.

Methylene blue has been recommended. We have not had sufficient experience with this drug to justify us in recommending it, nor does our knowledge warrant its recommendation.

The plan we suggest is one of local treatment of the affected cow, disinfection, and sanitation.

Parturient cows in infected herds, whether aborting or not, should be isolated from the herd and kept isolated until all discharges have ceased.

The afterbirth and litter contaminated with the discharges should be burned.

The cow should receive irrigations of some mild non-toxic antiseptic until the discharges have ceased.

The external parts of the cow should be cleaned daily.

In case of abortion the animal should not be bred until all discharges have ceased.

At the time of service the sheath of bull should be irrigated and the under surface of the bull's abdomen should be cleaned before and after service.

A 1 to 1000 solution of potassium permanganate, $\frac{1}{2}$ of 1 per cent compound solution of iodine, a $\frac{3}{4}$ of 1 per cent solution of compound solution of cresol, or sour whey may be used for uterine and vaginal injections.

Drastic or improper treatment of the genital organs of a cow is more injurious than no treatment at all.

fields, where most of the hay has already been cut owing to scarcity of water for irrigation during the summer. Here the cattle find good pasture for some time, after which they are put in sandy fields and fed chopped alfalfa hay in racks in the open, until the hill ranges are again green.

By this system of feeding and breeding the heifers are large enough at two years old or a little better to drop their first calves and not be stunted; and as before stated the steers are turned off at a profitable age.

HOG BUYERS' MARGIN.

To the Editor: What should be the price of hogs delivered at Winters when you quote them at $8\frac{1}{2}$ to $8\frac{3}{4}$ cents for 150-250 pound animals?—D. S., Winters.

[The buyer may rightly charge about 1 cent per pound for freight, shrinkage, commission, inspection, etc., according to a man in position to know.]

A cream separator speedometer concern investigating the need for such speedometers, found, in over 4,000 different cases, that 95 per cent of farmers turn their separators too slow. Some of them were losing over \$100 worth of cream per year.

Bleeding that can be stopped with dust or powder would soon stop anyhow. Clean the wounds and protect them, but do not keep washing them out if they are healing.

Creolin or zenoleum is recommended for the mange on horses.

KNOB HILL STOCK FARM Registered Big Type Poland Chinas : : :

SOME TYPICAL KNOR HILL BROOD SOWS.
(Large type, combined with high quality.)

Our herd is nominated in the California Poland China Futurity to be held in connection with the State Fair this fall. We have just imported and added to the herd some of the best blood of the East, including boars from W. J. Hather, Ord, Neb., and Peter Mouw, Orange City, Iowa. We are offering pigs of both sexes from prize-winning stock. Litters coming at all seasons and stock usually on hand to suit customers.

Come and see them, or write for what you want.

ALL STOCK REGISTERED. ALL BREEDING GUARANTEED.

A. M. HENRY, Prop. Farmington, Cal.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. PRINCE GELSCHE WALKER, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breeding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by KINTYRE LAIRD, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality, the herd is unexcelled in the West. At the head of the herd is BAKER'S BOY, junior champion and reserve grand champion at P. P. I. E.

Anita M. Baldwin, W. H. TAYLOR, Superintendent.
Santa Anita, Cal.

IMPROVING AND FEEDING BEEF CATTLE.

[Written for Pacific Rural Press.]

It is an old but well-known theory that the best way to convince a man is to show him; and that is the most convincing argument in favor of purebred Hereford bulls that D. B. Harris of Minturn has to offer.

Mr. Harris manages the 4,000-acre Sierra Vista Ranch which supports about 300 range cattle besides a herd of purebred Herefords. A thousand acres of the ranch is also planted to grapes and a good portion to alfalfa and grain.

About 15 years ago Mr. Harris started to breed up a herd of Arizona range cows with Shorthorn bulls. In 12 years, he had succeeded in getting a steer that as a three-year-old would average around 1200 pounds.

Three years ago, however, he substituted his Shorthorn bulls for Herefords, and now instead of selling "threes" he sells "twos," the older "twos" this year averaging 1204 pounds while the younger ones averaged 1080. In other words his steers now average approximately the same weight on the same feed as two-year-olds as they formerly did as three-year-olds. They are yearly becoming higher grades.

Feed conditions on this ranch are somewhat different than on the ordinary cattle range, the practice being to run the beef cattle on hill ranges in the early spring when feed is plentiful there.

As soon as the green range gives out they are taken to the alfalfa

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

HEIFER DOESN'T BREED.

To the Editor: I have a heifer 17 months old which has been served four times but is not with calf yet. She comes in heat regularly.—T. C. P., Escalon.

[Have an examination made of this animal.]

LUMP ON COW'S JAW.

To the Editor: Within 10 days a Holstein cow has developed a big lump under her jaw. It is getting bigger and tougher. Milk flow somewhat affected. Using liniment. Cow is on pasture—mouth looks clean and teeth healthy.—S. H., Kerman.

[Have this lump lanced.]

MULE HAS LUMPS.

To the Editor: Several years ago our mule had a lump on her front leg just where it leaves the body. It was claimed she had been kicked there when a colt. It has not troubled her any until last month. Now it has grown a lot and she is lame. She has a small lump on each hip, one on belly, and one on the leg below the first one. This last named one seems soft. She eats well and feels fine. We feed the best oat hay and corn fodder.—Mrs. S. T. L., Oroville.

[What color is this animal. Additional data will have to be given for a diagnosis.]

PIGS COUGH AND DIE.

To the Editor: My shoats cough, get the thumps, go down in flesh, and run at the nose. Every few days one dies.—F. C. M., Orland.

[This is swine plague. A vaccine is now marketed for this trouble.]

HEIFER GIVES BLOODY MILK.

To the Editor: Milk from a two-year heifer which freshened last February has a trace of blood occasionally; lately blood shows in bottom of pan when milk sours; sometimes a small clot of blood shows when milk is strained through a cloth. She milks a trifle hard.—P. S. K., San Jose.

[Give 2-dram doses twice daily potassium iodide dissolved in water for about two weeks.]

FRESH COW HAS NO MILK.

To the Editor: A cow had her second calf yesterday. Both seem well, but her bag is floppy; had only a pint of milk this morning. It is not sore. She gave plenty of milk last year.—R. D. L., Fresno.

[Give 2-dram doses twice daily pilocarpine hydrochloride and 2½ grains strychnine sulphate dissolved in one pint water. Divide this in three doses and give one dose every three hours.]

Sonoma-Marin Fair Livestock Exhibits.

[Written for Pacific Rural Press.]

Horse racing is the chief consideration at the Sonoma-Marin District Fair. The accommodations show it. It is not a farmers' fair. It may serve as a farmers' recreation period, for the attendance was good. The stalls for livestock were well filled, but that isn't much, numerically.

People have some fine livestock in that district, however, not to be far eclipsed by anything the State can show. And they were out with their best—what few showed.

Swine.—The most remarkable exhibit of livestock was the hogs. Poland Chinas and Chester Whites seemed lacking, but there were typical lots of Durocs, Yorkshires, Tamworths, Hampshires, and Berkshires. The latter were in greatest numbers and quality. F. A. Brush had 23 head including the P. P. I. E. grand champion sow Riverby Princess and two of her litter mates. These will be shown at the State Fair, the Princess for exhibition only. Reserve champion P. P. I. E. boar Ames Rival 102nd and third premium P. P. I. E. boar Charmers' Duke 77th were there, also Mayfield Rookwood 2nd, a beautiful young boar, and Mayfield Lady 2nd, bought at Carruthers' sale. This herd won first in all the six divisions and second also in the three boar divisions.

S. A. Brittain, E. C. Rand, and J. M. Robinson had smaller exhibits and each took some of the prizes. Mr. Brittain's sow and 8 pigs won first in that class, in competition with all breeds.

Durocs were shown by W. C. Chisholm of Windsor and R. Q. Wickham of Glen Ellen. The latter took three firsts out of the five awarded. He showed a typey but thin sow from which nine pigs were weaned just before bringing her to the Fair. She will be shown in better condition at the State Fair with several others. Mr. Wickham's sow and pigs won second. Mr. Chisholm's big Sandy Mac won first prize by his size, length, well built back and standing well on his toes. There were 15 Durocs in his exhibit.

Rosevale Ranch had a heavy Hampshire boar and a small sow with four big pigs.

S. A. Stetson of Santa Rosa, who has within a year or two begun to replace his mixed herd with purebred Tamworths, had sixteen head, including a sow with ten lively pigs.

Lloyd and Tointon of Santa Rosa, who have sold practically the last of their common stock recently, were out with large Yorkshires of Riverina Farms breeding—a lot of smooth, clean, businesslike hogs of what Mr. Tointon believes is the coming type—primarily for bacon. Three of them, born last September, weighed 685 pounds last July. One of these is Riverina Admiral, a boar sired by Oak Grove Lad the 7th.

Draft horses made an attractive showing. Jack London had a large herd of mettlesome Shires including the aged stallion Neuadd Hillside 1st and three mares with their colts. He also won the premium for best two-horse draft team hitched up. Percherons were represented by Laos and Knor, spirited black stallions, and an iron gray mare Jeremie. The Rosevale ranch showed three jennets.

Beef cattle were represented only by a few Shorthorns and a bunch of 19 grade Hereford calves, 4 to 6 months old, the latter belonging to Al Chamberlin of Santa Rosa and being in nice uniform shape. Victor Piezzi had a big red aged Shorthorn bull which won 1st over a roan, while Jack London won 1st in Division 4, as well as several other prizes.

Dairy cattle at the Santa Rosa fair were mostly Jerseys and Ayrshires. T. B. Purvine of Petaluma made the biggest strongest showing of Jerseys, though M. A. Luce took several prizes. Mr. Purvine's Raleigh's Fairy Boy 4th and seven head, mostly of his blood, took most of the firsts. He will show two full herds at the State Fair including about 16 head. The LeBaron Estate of Valley Ford showed the aged Ayrshire bull Willowmoor Peter Pan 21st with four cows and three calves.

Goats were shown by L. A. Bridinger with Toggenbergs, D. H. Currier with American goats.

Raising Poultry for Profit

RAISING POULT FOR PROFIT.

[Written for Pacific Rural Press]

The feeding question bobs up serenely every once in a while and it is right that it should do so because the only way to solve any question is to discuss it with others and find out what they know about it.

Last week I attended the poultryman's meeting (by the way, we hold our meetings in the public library), and Mr. Schofield of Gardena spoke on the feeding problem, giving some valuable ideas. The High School at Gardena is now giving a series of poultry lectures; they have been experimenting a good deal along the line of feeding and Mr. Schofield gave us some of the results.

At present the poultrymen of Southern California are going through the ordeal of making changes; the association is trying to raise weight standard from 20 ounces to 22 ounces to the dozen, the same as the San Francisco market calls for. Heretofore, the Los Angeles market has accepted the 20-ounce eggs, but it has been decided to progress in both weight and quality. Now in order to increase the weight of eggs laid by the same flock of hens the feed must be studied from scientific experiments. Haphazard feeding will not do. A man must take time to watch his hens and time to prepare the right kind of feed.

Strictly speaking, I believe the poultrymen in the South do from necessity produce better quality eggs and more of them; but they have been too well satisfied as to size and weight, hence the Petaluma egg has been proving a thorn in the flesh, by getting a better price on our markets than the local egg. This state of things is to be changed and poultrymen must breed up flocks of hens that will lay larger eggs. Until that is done, the very best that can be done by feeding is to be the program.

"It has been proved", said Mr. Schofield, "that green barley makes a much heavier egg than any other green feed; not that I disparage lettuce, kale, or anything else, but that barley, being a dryer green feed, makes the heaviest egg."

Another point brought out was that 20 per cent protein is all that hens can stand as a regular diet and retain health and vigor. It was said that if a hen eats 2 ounces of a mixed mash, she can be fed 2 ounces of grain; but I do not agree with that—a hen needs more grain than mash or the gizzard will be idle too long.

Now here is a letter from one of our readers who wants to give his experience on the feeding question; this is a very useful and practical way of helping others. It comes from a man who is raising just a few chickens. I always say the fellow who is raising thousands has his own particular way of doing things and I let him alone, being satisfied to help the little man or the man with a small acreage and poultry plant.

Sprouted Grain on Cool Ground.—"Dear Madam: I take the Pacific Rural Press; and since wife and I

have been dabbling in poultry for some years, we are interested in your notes in the Press. We have too small a flock, and too little money at one time to buy feed in quantity and we can only get certain kinds of feed at this place. We have fed 'Sure Lay Mash,' but now are mixing our own mash. We have a little alfalfa patch and this we chop up and steam; our mash is equal parts bran and mids and one pound of fish meal to ten pounds of the mixture.

"It is so hot and dry here in summer that it is hard to keep poultry in condition, so I got on to a scheme. I wet a piece of ground, five or six feet in each yard, dug the ground up and put wheat in it. Every night I wet up the same place and put the wheat on it and dig it up in the morning, some of it sprouts, and you should see the stock, young and old, dig for that bit of green. They eat and roll in it doing just as they please.

Now for Results.—"January to July, 1915: About 25 hens laid 2076 eggs. Value here \$43.75. Average eggs per hen 83. Average value of eggs per hen, \$1.73. We expect our hens to drop in laying from June on. In June, 1915, the hens laid 231 eggs; in July 154 eggs." (My friend does not say but I infer that his hens in 1915 were fed just the ordinary dry feed with alfalfa for green, and that in July, 1916, the hens had the moistened ground and the wheat thrown in for them to scratch out and eat at their leisure.)

"January to July, 1916:—Average number of hens, 37. Number of eggs laid, 3707. Value here, \$74.94. Average per hen, 100. Value of eggs here, per hen \$2.02. In June, 1916, 29 hens and 549 eggs; in July 509. Most of the layers were pullets both years. I think that the wet ground and sprouted wheat, together with the cool moist mash at noon, has much to do with the increase in eggs and increase of profit.—C. E. S."

Now you see I am giving you these practical experiences hoping they will have the effect of hammering in what I have been preaching for the last eight years, namely, sprouted grain, no matter whether it is oats, barley, or wheat; and a cool moist place where the hens can enjoy life during the heat of the day.

Our friend's egg yield is not heavy; it is not even fair to what we should get; but the difference between an average of 83 eggs per hen, and 100 eggs per hen, is sufficient to prove that extra care is paid for by the hen in dollars and cents.

My friend says: "Besides eggs, we have sold over three hundred baby chicks. With our small flock, for seven months, we are ahead in cash receipts over all expenses, \$39.84 cents. The hens are now laying enough to pay their own feed bill and the feed bill for nearly a hundred young stock. I have wanted a greater variety of commercial feed, but they are too high and I have to content myself with the wheat and mash. Do you think it wise to use rolled barley and Egyptian corn?"

If I could not get any other feed than rolled barley I would, of course, feed it to chickens, but it would be soaked several hours to take the sting out of the beards. Gyp corn, if clean, is a splendid addition to the grain feed, but it is not nearly so strong in egg-making elements as is wheat; so in feeding it allow a little more; and then it is best to mix it for hens that have been used to wheat. Sudden changes are never safe. Make the change gradually. Unless the Gyp corn is cheaper I would not change at all, but just give a little in the scratch grain by way of variety. Hundreds of chickens die annually from eating rolled barley and when the barley is so much cheaper than other feed it really pays to feed it, loss or no loss. Soaking softens the beard and lessens the death rate, but at the price barley is now I say let the dealers keep it; and feed more wheat, Gyp corn, and oats.

The Petaluma Chamber of Commerce is reported as unanimously endorsing the proposed State association of poultrymen. They appointed a committee to get a promotion fund from the business men.

MRS. BEST'S LETTER.

My dear Friends:—

I know that some of you are in the midst of your warmest summer weather and yet to look at the shop windows, you would never think but that fall was near at hand.

With the exception of a few wash garments that are being closed out at reduced prices the windows are devoted exclusively to fall and winter garments. In suits, the early models are decidedly plain, many of them with quite snugly fitted coats with many seams are flaring skirts. The materials are broadcloth, serge and mixtures. Some of the dressier types are trimmed in fur, a style that is always attractive.

In the one-piece dresses, there are styles for all figures and at all prices—most of them are of serge, but do not conjure up in your mind, the simple little serge dress of several seasons ago, depending on a fancy collar and cuffs for its ornamentation, for these dresses are far removed from that simple style.

There are many new style features—wider skirts, draped tunics, gay braid trimmings, large white sailor or novelty collars of cloth or satin with touches of embroidery much in evidence. Practically all of these garments are partly composed of satin, and very smart, pretty dresses they are. They would make very serviceable dresses for school wear, if you have a daughter who will be away at school this year, and with a fur neck-piece would be good looking for street wear without a coat. Many hang from the shoulders, loosely belted in, fashioned like small girls' dresses, while others have snug-fitting bodices, with either full pleated skirt or draped tunic effect and all with long, tight-fitting sleeves.

I have seen a few white leather collars and cuffs, but the newest is the white felt, finished with a picot edge.

In blouses, the striped tub-silks are very popular for school and general utility wear, while the sheer Georgette crepe with large simple collar and frill is the latest dictate of Fashion. Large neckties, except for sport wear, are a thing of the past. These blouses are worn with either a simple pin or a small, flat bow of ribbon, harmonious to the costume.

ROSABELLA BEST.

SAVE KITCHEN WORK.

A woman who does the house work for an average family walks as far as the distance around the world every six years, but part of this 25,000 mile walk can be saved by having a more convenient arrangement of kitchen where a large share of a woman's walking is done.

The Missouri College of Agriculture at Columbia have recently sent out plans for the remodeling of kitchens to make them more convenient. These cover: (1) rearranging kitchen equipment already on hand, without any cost, (2) remodeling the present kitchen to make it more convenient, (3) the selection of equipment, and (4) planning a new kitchen. Copies of these circulars will be sent on application,

DILL PICKLES.

Select medium-sized cucumbers. Fill the jar one-quarter full of them, alternating the layers of cucumbers with a small amount of dill, about three branches with the seeds on them. Continue this until the jar is full. Then make a brine as follows: 1½ quarts water, a small cup vinegar, and 5 tablespoonfuls salt. Add just a dash of red pepper. Pour this over the cucumbers, put grape leaves on top and a weight over the whole. Set in a warm place for 3 days. They may then be removed to a cool place and are ready for use.

TO HOLD THREAD.

Women who do crocheting, knitting and other forms of needlework know how aggravating the yarn can tangle up and the spool or ball roll away. A bracelet spool has been designed that does away with all this. The spool is revolvably mounted on a bracelet, which is open at the bottom and can easily be clasped on the wrist. The thread feeds over the back of the hand and there is no possibility of tangling. The spool is held lightly in two spring clasps, so that it can easily be removed and a fresh spool put in its place.

USE OF BAKING SODA.

Baking soda is beneficial for many ailments, but it is not necessary for cooking any vegetable, green or dried. If string beans are so old and tough that they need soda, it is best not to cook them. Fresh, green vegetables never need it, but many women add it, because they are in a hurry and it softens the vegetables quickly. Dried beans properly prepared do not need it either.

CHEESE BALLS.

Use any cream cheese; cottage cheese will do but has not so much flavor. Combine with it chopped nuts, preferably walnuts or almonds, chopped green pepper or green olive; season to taste with salt and pepper. Add enough cream to make it easily molded into balls about like marbles. Roll these in cracker crumbs made as fine as flour. If you would like a brown covering, cut slices of white bread, dry it in the oven until brown; then grind very fine and use instead of cracker crumbs.

CRAB APPLE JELLY.

Wash apples, remove stems and blossom end and cut in halves. Put into granite preserving kettle and cover with cold water. Cook slowly until apples are soft, mash and drain through a sieve. Drain juice through jelly bag. Measure, boil about 20 minutes and add ¾ cup of sugar to each cup juice. Boil 5 minutes, skim and turn into glasses. For variety of flavor, add juice of strawberry, raspberry, or mint or rose geranium leaves.

FLOORS AND FLOOR COVERINGS.

Fortunately, the day of nailed-down carpets is almost gone. The sooner all carpets are replaced by rugs the better, for they are cleaned so much more easily. Even though a floor is of soft wood, the cracks can be filled and three or four coats of good paint applied. Then if rugs are used where there is the most traffic, the finish will last well. To keep painted floors in good condition, sweep with a soft, hair brush and dust with a dry mop.

Varnished floors are cleaned by sweeping with a soft brush and dusting with an oiled mop. An ordinary dry mop moistened with a few drops of linseed oil and allowed to stand several hours, is very satisfactory. The wearing quality of a varnished floor is much improved by waxing. The worn places can be rewaxed without applying fresh varnish if taken in time. A good hardwood floor should be waxed without varnishing.

FASHION NOTES.

A very attractive between-season hat is a toque of white breast feathers.

The new winter coats of velour are made with large cape collars, wide belts and big buttons.

Fancy neck-pieces of net, trimmed in ruchings of the same material and combined with ostrich bands, are very popular.

The coats of the new tailored suits are to be much more fitted than formerly and with a decided fullness below the waist line. They are longer also.

Italian silk sweaters seem to have had their day, for there are beautiful ones being offered at less than ten dollars.

One of the newest of the fall hats is a black velvet sailor trimmed with a long white breast around the crown.

The large felt hats come in all the pretty shades and are most reasonable in price and attractive.

MINCE MEAT RECIPE.

To the Editor: There are numerous ways of making mince pies, but according to the writer, who is an expert pie sampler, those made by Mrs. N. H. Finmand of Eagleville, have just a little bit nicer taste than any sampled to date. Following are the ingredients and the amounts used of each: 5 pounds of apples, 1 pound currants, 1 pound raisins, 1 teaspoonful each of cloves, nutmeg and cinnamon, ½ pound of citron or 1 quart of preserved watermelon rind, 1 quart of cider or in the absence of cider, use vinegar, and 3 pounds of meat made from the lean of the head of a hog.—W. D. G.

TO CLEAN SILVER.

In the early summer, we printed a recipe for the use of the "Silver Clean" zinc pan. This called forth the following from a Denver subscriber: "Did you know that the best electrolytic to use is a piece of aluminum, free from grease, any size or shape. Beats zinc all hollow."

Like Gas
for comfort
and convenience

NEW PERFECTION OIL COOK-STOVE

No coal, wood or ashes to lug—no waiting for the fire to burn up. Better cooking because of the steady, evenly-distributed heat, under perfect control. All heat concentrated on the cooking and not radiated around the room. The long, blue chimneys prevent all smoke and smell.

Bakes, boils, roasts, toasts. More efficient than your wood or coal stove and costs less to operate.

Use it all the year 'round.

THE WORK-BOX PEOPLE.

By Ella F. Mosby.

"We ko through all our work,"
The needles proudly cry;
"But not until you're pushed,"
Is the thimble's apt reply.

"Ours is a strong attachment,"
Whisper hook and eye together;
"Yet you need us to secure you"
Hum the threads, like windy
weather.

They all reproached the scissors.
But the scissors didn't care:
'Twas his trade to cut acquaintance,
And he did it with an air!

Gayly jesting thus, and boasting,
Work-box people all at play!
Silence, all! it is the mistress
Coming from across the way.

THE STORY OF THE LARGE STONE.

Once there was a king who took great delight in teaching his people good habits. "Bad luck comes only to the lazy and the careless," said he; "but to the busy workers God gives the good things of this life."

One night he put a large stone in the middle of the road near his palace and then watched to see what the people who passed that way would do.

Early in the morning a sturdy old farmer named Peter came along with his heavy ox-cart loaded with corn.

"Oh, these lazy people!" he said, driving his oxen to one side of the road. "Here is this big stone right in the middle of the road, and nobody will take the trouble to move it."

Then came a young soldier, singing a merry song as he walked along. A gay feather was stuck in his hat, and a big sword hung at his side, and he was fond of telling great stories of what he had done in the war. He held his head so high that he did not see the stone, but stumbled over it and fell flat into the dust.

"Silly drones!" he said. "To have no more sense than to leave a stone like that in the middle of the road!"

An hour later there came down the road six merchants, with their goods on pack-horses, going to the fair that was to be held near the village. When they reached the stone the road was so narrow that

they could hardly drive their horses between it and the wall.

"Did anyone ever see the like?" they said. "There is that big stone in the road, and not a man in all the country but that is too lazy to move it."

And so the stone lay there for three weeks; it was in everybody's way, and yet everybody left it for somebody else to move.

Then the king sent word to all his people to meet together on a certain day near his palace, as he had something to tell them.

The day came, and a great crowd of men and women gathered in the road. Old Peter, the farmer, was there; and so were the merchants and the young soldier.

"I hope that the king will not find out what a lazy set of people he has around him," said Peter.

And then the sound of a horn was heard, and the king was seen coming toward them. He rode up to the stone, got down from his horse, and said:—

"My friends, it was I who put this stone here, three weeks ago. It has been seen by every one of you; and yet every one has left it just where it was, and scolded his neighbor for not moving it out of the way."

Then he stooped down and rolled the stone over. Underneath the stone was a round, hollow place, in which was a small iron box. The king held up the box so that all the people might see what was written on a piece of paper fastened to it.

These were the words: "For him who lifts the stone."

He opened the box, turned it upside down, and out of it fell a beautiful gold ring and twenty bright gold coins.

Then every one wished that he had only thought of moving the stone instead of going around it.—
Sacred Heart Review.

Is it any use to give the orchard good care and lose the crop by neglecting to spray in time?

Open Sundays and Evenings

Just as surely as the roof tops the house, does the question of what roofing to buy top all others when it comes to how best to protect property against wind and weather.

Wood-Crane Prepared Roofing

is so far and away above all others that it is in a class by itself. It is a roofing that you can put on your home, on your church, on the town hall. It will ornament the building and vie with the foundation stones in wearing qualities. It never fails to make good. Anyone who can use a hammer can lay it. Every roll is 36 in. wide and guaranteed to cover 100 sq. feet.

PRICES
\$1.35 to \$2.55 per Roll
Nails and Cement Free

Send for Free Samples. Test them for weight, strength flexibility, fire resistance qualities and compare them with any roofing costing from \$1.00 to \$1.50 per roll. We are the largest distributors of America's Best Goods on the Pacific Coast. We can save you money and guarantee to give you satisfaction. Write today for Roofing Samples and our big catalog—a postal will do.

Wood-Crane Company

San Francisco, Cal.

SANITARY.

A small boy had a bad cold and snuffed abominably, to the great annoyance of the other passengers in the car in which he was riding. Finally, says the Manchester Guardian, one of the suffering men turned on the offending youngster and said, "Have you a handkerchief?"

"Yes, sir, said the boy, "but mother don't like me to lend it to strangers."

JOTTINGS.

Fly Spatter.—There is a new fly spatter on the market, made of perforated rubber. It is very flexible and will not scratch or injure furniture.

Dish Mops.—The five-cent dish mops are invaluable for cleaning out fruit jars and large-necked bottles.

Burned Kettles.—For badly burned kettles, use a teaspoonful of lye in a cup or two of cold water and let come to a boil. The result is very satisfactory.

DO YOU.

Repeat the Golden Rule and then Sneeze in somebody's face?

Go camping for your health and then place your toilet so that it drains into your water supply?

CUPID, TOO, WAS UP-TO-DATE.

"Engaged to four girls at once?" exclaimed the horrified uncle. "How do you explain such shameless conduct?"

"I don't know," said the graceless nephew. "I guess Cupid must have shot me with a machine gun."

The head of a big London business concern is exceptionally tall and slim. A visitor called to see him, and was asked to sit down. The visitor rose to go, his host rose also, and seemed to rise and rise. The visitor, letting his glance travel upward, as though inspecting a new species of skyscraper, with an expression of awed admiration ejaculated, "Great Scott, old man, your parents must have trained you on a trellis!"—Tit-Bits.

An Irishman was walking through a pasture when a bull rushed up and tossed him over the fence. Picking himself up quickly he faced the animal and said with suppressed wrath—"If it wasn't fer yer bowin' and yer scrapin' and yer apologizin' I'd o' thought you did that on purpose.—Exchange.

Mr. Harry Tate, seeing a number of small boys busily engaged in asking one another riddles, thought he would give them a poser. Going up to one of the lads, he asked, "What time is it when a clock strikes thirteen?" "Time it was taken to be mended," answered the urchin, promptly.

"I see they have just dug up a corner-stone of a library in Greece on which was inscribed '4000 B. C.," remarked a student to a Scotchman. "What do you suppose it means?" "It canna mean bu' one thing," answered the Scot, solemnly: "Before Carnegie."

There wasn't any money in dried peaches when there wasn't any co-operation.

Hop Aboard
with the
Marines and
Sailors of the
U. S. A.

Get your feet into the socks the marines and sailors wear—long-lasting, soft, well-knit, foot-comforting Durable Durham Hosiery.

Yes, the marines and sailors wear 'em, work in 'em, play in 'em, and, if need be, they'll fight in 'em, too. And the reason:

Durable Durham Hosiery stands the gaff of government inspection, the most rigid of examinations. Each separate thread of each separate sock must measure up. Durhams do. And this is the evidence:

404,416 pairs of Durable Durham Hosiery were recently shipped to the Navy Department. 100,000 pairs were for the marines, 16 pairs were rejected. 304,416 pairs for the sailors, only 5 pairs weren't up to snuff. And these only because they had been damaged in packing.

DURABLE DURHAM HOSIERY FOR MEN, WOMEN AND CHILDREN

There is a sock for you in the Durable Durham Line that's got every bit of the comfort and the durability that the government specifications demand for the wear of the sailors and marines—the identical strong, reinforced toe and heel—knit of the same yarn and with the same care—but it is a smarter sock, with uppers that are sheer and light.

We have named this sock 1700 G. S. It is a regular number of the Durable Durham Line.

It will wear like iron—there is a fit for every foot, and 1700 G. S. is surely smart. Exactly the same—long-wearing, strong, grateful to the feet and handsome—are The Durable Durham stockings for women and children.

And the wonderful part is that Durable Durham for men, women and children sell for 10, 15 and 25 cents the pair. Each pair is guaranteed with a guarantee so broad and strong that you might have written it yourself. This guarantee is made possible only by expert manufacture and rigid factory inspection.

DURHAM HOSIERY MILLS
Durham, N. C.

This guarantee is on every pair of Durable Durham

Bumper Grain Crops Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription.

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Gov't Agt., Canadian Bldg., Exhibition Grounds, San Diego, Cal.

San Francisco, Aug. 16, 1916.

Wheat.

With further evidences of short crops in the principal producing areas, prices continue to jump, the local advance following changes in the Eastern and Northern markets.

[f. o. b. San Francisco.]

Sonora wheat\$1.90 @1.95
Northern club 1.92½ @1.97½
Calif. club, ctl. ... 1.95 @1.97½
Northern Bluestem. 2.00 @2.05
Northern Red 1.92½ @2.05

Barley.

The advance on wheat has a stiffening effect on all grains; and aside from that there has been quite an active buying movement in future barley, with enough spot demand to cause marked advance.

[f. o. b. San Francisco.]

Shipping, ctl.\$1.65 @1.70
Choice feed, ctl. 1.62½ @1.65

Oats.

A lively demand and moderate offerings, both red and white feed oats have advanced again, red seed also slightly higher, black and Texas seen holding firm.

[f. o. b. San Francisco.]

Red feed\$1.75 @1.80
Red seed 1.90 @2.00
White 1.65 @1.70
Black seed 3.00 @3.25
Texas Red seed 2.10 @2.25

Corn.

Eastern corn shows no further change, but the general advance is causing an upward movement in sorghum grains.

[f. o. b. San Francisco.]

Eastern Yellow, ctl.\$1.97½ @2.00
Milo Maize 1.75 @1.80
Egyptian 1.85 @1.90

Beans.

The bean market is uninteresting, as there is not much left in most varieties, prices are easy, with some recession from extreme figures which prevailed for a time. This week has brought a sharp drop in large whites and pinks, as some holders have been anxious to clean up, and little demand. The market is extremely quiet on nearly all varieties, the tendency of values is toward about normal level, notwithstanding the shortage.

[On wharf, San Francisco.]

Bayos, per ctl.\$5.50 @5.60
Blackeyes 3.25 @3.50
Cranberry beans 5.50 @5.60
Horse beans 3.25 @3.40
Small Whites (south) .. 7.00 @10.00
Large Whites 6.75 @7.25
Pinks 5.75 @5.90
Limas (south) 5.65 @5.75
Red Kidney 8.00
Mexican Reds 5.50 @5.60
Tepary beans 4.50 @4.75

Hay.

Arrivals have fallen off a little, owing to the fact that cars are hard to get on all the roads, most hay is coming by boat. Consequently local demands are rather meagerly supplied, and values are quite firm. Dealers say there is still a great deal of hay in the country, which the owners are anxious to ship, and predict a drop in local values when shipments increase. The light crop and prospect of large feeding requirements during the late fall and winter however, would seem to be in favor of a firm market. Fancy hay is scarce and firm. Local offerings of alfalfa are sufficient, with steady values.

(Wholesale prices per ton, carload lots, San Francisco.)

Wheat, No. 1\$13.00 @14.50
No. 2 10.00 @12.00
Tame oats 11.50 @15.50
Wild oats 10.50 @13.00
Barley 10.50 @13.00
Alfalfa 10.00 @14.50
Stock hay 8.50 @9.50
Straw, per bale35 @.50

Under date of Aug. 15th, these quotations are furnished by Nicholl-Loomis Co., Los Angeles:

Barley hay\$10.00 @14.00
Wheat hay 10.00 @14.00
Tame oat hay 12.00 @16.00
Northern alfalfa 11.00 @13.00

Local alfalfa 12.00 @15.00
Stock hay 6.00 @9.00
Straw 5.00

Feedstuffs.

Beet pulp is again offered in small lots, and larger supplies expected soon, about \$23 per ton asked. Alfalfa meal in good demand at slight advance, all lines are firm, in sympathy with grain market. Cracked corn and rolled barley have been marked up, and other advances are expected soon.

[Wholesale prices, per ton, carload lots, San Francisco.]

Beet pulp, per ton ..\$23.00 @23.50
Alfalfa meal, per ton. 17.00 @18.50
Bran, per ton 28.00 @29.00
Oil Cake Nominal
Cocoanut cake or meal 23.00 @25.00
Cracked corn 43.00 @44.00
Middlings 35.00 @38.00
Rolled barley 33.00 @34.00
Tankage 45.00
Rolled oats 34.00 @35.00

Vegetables.

There is considerable activity in the local garden truck market, values on most lines are well maintained, notwithstanding large offerings. Cucumbers are moving well at steady prices. String and lima beans and peas all higher, good stock is getting scarce and quickly disposed of. Supplies of summer squash excessive, causing a drop in top figure; values have also been shaded on cream squash and okra. Green peppers have been hard to move and good stock has sold as low as 25c. per lug. Eggplant steady. Tomatoes easy, but old range is still quoted; green corn occupies a similar position, with liberal supplies, though better lots clean up well.

[Wholesale prices, San Francisco.]

Cucumbers, 50-lb. lugs ...40 @60c

Peas, lb 4 @5c
Tomatoes, lugs 50 @1.00
Green corn, sack 1.00 @1.75
Okra, box 50 @65c

Potatoes and Onions.

There has been quite a heavy shipping demand for potatoes for the last week, and more would be shipped if cars could be had. This is causing a shortage of choice Delta stock in local market, with a crop which was already light; prices have accordingly taken a sharp turn upward on both Salinas and Delta stock. No. 2 potatoes are only steady as last quoted, onions show a further decline on increased offerings.

[On wharf, San Francisco]

Potatoes, ctl., Delta ..\$1.75 @2.00
No. 250 @1.00
Salinas 2.40
Onions, yellow 1.00 @1.25
Garlic, new crop, per lb .. 4 @5c

Poultry.

A few live turkeys are now coming in and readily disposed of at 25 to 30c. Belgian hares plentiful and dull, with lower prices. There is a good demand for chickens in general, and fairly liberal offerings in most lines well taken up, a slight advance on broilers and fryers. Large colored hens find fair sale, small leghorns are a drug on market, mowing slowly at lower prices, apparently owing to the cleaning up of star boarders from egg ranches.

[Wholesale prices, San Francisco.]
Broilers, 18 lbs. to doz. and

less, lb 20 @22c
do, over 18 lbs. to doz. .20 @21c

Belgian hares 9 @10c

Butter.

Arrivals are running rather heavy, keeping prices on all grades down to figures last quoted, notwithstanding a heavy movement. There has been a large shipping business for London, six cars having been sent within the last few days, and it is believed may continue for some time, though little shipping in other directions.

[S. F. Dairy Exchange prices.]

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	26½	26½	26½	26½	26½	26½
Prime 1sts	25½	25½	25½	25½	25½	25½
Firsts	25	25	25	25	25	25

Eggs.

Prices have reached a comparatively high level for this season, with a little drop on the outside demand; with fairly large receipts, it has been impossible to get any advance on extras since last report. The only change is a 1½c. rise on pullets since first of the week, as former advance of extras is giving lower grade more prominence.

[Los Angeles Dairy prices.]

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

Deciduous Fruits.

The local market, in sympathy with outside conditions, shows firmness, especially in lines which are shipped extensively. Huckleberries are lower, with increasing supplies; all other berries stand at old level, with liberal supplies in most lines. Gravenstein apples higher, with strong demand, the crop will soon be cleaned up. Bellflower prices opened at 75 to 80c., Watsonville and some outside shipments are moving, though State rules will not permit shipment to this market until the end of week. Peaches are cleaning up well, and good stock is higher; pears and plums also are firm. This is due to unusually heavy Eastern shipping demand, shipments having been made from San Francisco market, which is exceptional; there is difficulty in getting cars enough to handle the business. Figs lower on liberal offerings, but demand is fair. Cantaloupes steady, moderate offerings; watermelons are higher. Casabas coming in, but not yet of a feature. Malaga and muscat grapes lower, with increasing supplies.

[Wholesale prices, San Francisco.]

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Aug. 14, 1916.

The shipment of Malaga Grapes is at this time unusually heavy, the tonnage averaging 85 to 90 cars a day; in some instances this amount exceeds 100. The demand up to the present time has been able to take care of what shipments have arrived, but we look for a declined market very shortly on account of increased offerings. In our judgment it would be advisable to withhold shipments and better regulate the output to assure satisfactory prices throughout the season. We cannot see the necessity of unnecessarily rushing this fruit to Eastern markets and stifling demand. There is no particular reason why grapes at this time could not be held back. Tokays are ripening slowly. The first straight cars will leave the Florin district this week. We look for good demand, stiff markets and high prices for the first two weeks and satisfactory prices for balance of the season, with

demand active throughout. Cannery stock is now moving, averaging \$30 a ton for Phillips Salway peaches will be ready for shipping in about ten days and we believe they will be disposed of at good prices, provided the shipments are not heavy. The following prices have ruled for the week:

New York.—Bartlett Pears averaged \$2.89; Elberta Peaches, 98c.; Gross, \$1.63; Giant plums, \$1.36; Kelsey, \$1.66; Thompson grapes, \$1.65; Tokay, \$2.38, and Malaga, \$2.21.

Chicago.—Bartlett Pears, \$3.02; Elberta peaches, \$1.00; Lovell, 90c.; Gross plums, \$2.06; Dukes, \$2.21; Hungarian, \$2.07; Kelsey \$1.93; Giant, \$2.03, Malaga grapes, 1.88; Thompson Seedless, \$1.44; Tokay, 2.52.

Total shipments to Aug. 15, 7908 cars. Total shipments same date 1915, 6046 cars.

Special Livestock Market Report.

San Francisco, Aug. 16, 1916.

Hogs are on high level in spite of the rush of stubble hogs of very light weight. We saw the day's receipts at one packing house and none weighed 200 pounds, nearly half of them ranged between 120 and 140 pounds. This is business suicide for the farmer. Stubble hogs, however, are not "grain fed" hogs. Rooting over fields of scant feed does not make the same kind of pork that feedlots produce.

Cattle.—A good run has come from Humboldt and Mendocino grass. Not many grass cattle left in California.

Sheep and lambs are mostly coming from Oregon, North California, and Nevada. Lambs are of good quality but sheep mostly require feeding. Many of them are shipped to stub-

ble fields or to sugar beet sections to fatten on the beet tops.

Wool.—There is no material change. Where holders need money and must sell, only lower prices attract buyers. Eastern mills stocked up at lower prices and while English mills are buying on a high market, ships for export are not available. Foodstuffs and munitions must be carried in British boats. The government has taken over the wool of the Isles at a price lower than market prices, but their supply is equal to the absolute necessities. Defective and short wools are practically unsalable and will probably continue so until after the war. Good grades will probably pick up in January after the mills have taken inventory and are ready for steady weaving again.

Watermelons, doz. . . . 2.00 @ 3.00
 Grapes, Malaga, small box. .75 @ 90c
 Muscat, small box 75 @ 90c
 Grapes, Thompson, crate .90 @ 1.00

Dried Fruits.

The dried fruit business continues in the same lethargic condition as for some weeks past, with no sign of improvement for near future. The car shortage and prospects of a railroad strike have probably been deterrent features in regard to local buying operations: the East, with export outlets curtailed, is delaying purchases as long as possible. Apricots have been entirely neglected for some weeks, and notwithstanding admitted scarcity of stock, packers have been able to pick up some at concessionary prices, bringing a sharp drop in current quotations. Old prunes are easy, holders anxious to clean up, but there is little left. In new prunes buying continues slow; there is no prospect of better prices until demand revives.

[Net to growers, f. o. b. shipping point.]

Apples, new crop 5 @ 6 c
 Apricots, per lb. 1916 . . 9 @ 10 c

Citrus Fruits.

Oranges are commanding very high prices on the Eastern auctions, while lemons are lower. At the New York auction, Monday, Aug. 14, Valencia averaged from \$3.25 to 5.35 per box, and lemons \$7.20 to \$7.60. At Boston the same day Valencia averaged \$3.90 to \$5.40 and lemons 6.80 to 7.25 per box. Other auction points were about the same. Fancy oranges a little firmer in local market, but otherwise values are unchanged. The local demand in San Francisco is moderate at present, but heavy outside demand is setting the pace for values, preventing any excessive offerings.

[Wholesale prices, San Francisco.]

Oranges, Valencia, fancy box \$3.50 @ 3.75
 choice 3.15 @ 3.35
 Grapefruit, fancy 3.25 @ 3.50
 choice 2.50 @ 2.75
 Lemons, fancy 6.50 @ 7.00
 choice 5.75 @ 6.25
 standard 4.00 @ 4.50
 Lemonettes 3.75 @ 4.25

Honey.

Arrivals in San Francisco are still light, and trade scantily supplied. While some shipments are going forward from the country, Eastern buyers are offering some competition, and values are quite firm.

[Wholesale prices, San Francisco]

Water white, comb 13 @ 15 c
 Amber 10 @ 12 c
 Water white, extracted . . 8 @ 9 c
 Light amber, new 6 @ 7 c

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco

SECOND HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHEETER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—A 5-12 H. P. Farm Tractor, new, never been used. Owner selling ranch, pulls 2 12-inch plows or 5 inch centrifugal pump. \$400 cash for immediate acceptance. Box 227, Pacific Rural Press.

SLIGHTLY USED LITTLE BULL TRACTOR taken in trade for Big Bull will be sold for \$350 cash, fully guaranteed. Hughson & Merton, S. F.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds, \$3.00 delivered. Order with remittance. WM. J. SCHROTH CO., 112-B Market St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. SMITH'S CASH STORE, 106 Cay St., San Francisco.

ARAUCARIA BIDWILLI—The choicest and hardest shade tree known. Wild Plant Improvement Gardens, Santa Ana, Cal.

WANTED.

WANTED—ABOUT SIXTY YOUNG MEN and women to enter WESTERN NORMAL on August 28, 1916, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We also give a two-year high school course. For information, address WESTERN NORMAL, J. R. Humphreys, Principal, Record Bldg., Stockton, Cal.

EXPERIENCED FARMER, with capital, desires to lease either a good Deciduous Fruit Orchard, or Stock and Alfalfa Ranch, or a combination of both. There must be plenty of water available and be situated in a healthy part of the State. Box 225, Pacific Rural Press.

AGRICULTURAL COLLEGE GRADUATE—three years' experience, two as foreman in large deciduous fruit orchard, open for engagement after Nov. 1, 1916. Box 228, Pacific Rural Press.

WANTED—Reliable solicitors for country paper. Must furnish bond. 217 Underwood Building, San Francisco.

COUNTRY LANDS.

FOR SALE—140 acres hill land, 10 acres grapes, 80 prune and peach trees 9 years old; 4-room house, large barn, cement reservoir; water piped from a spring. Creek with water

all the year. About 15 acres cleared, 1 1/2 miles from Calistoga, Napa county. Fine climate, beautiful place for a home. Price \$2750. No exchange. Address T. S. Burnight, Ukiah, Cal.

WANTED—Farms, large and small, in all parts of the State. Our system of placing owners in direct communication with buyers has brought us hundreds of applications for farms. What have you to offer? Write for our listing blanks. Western Farms Bureau, 660 Market St., San Francisco.

TENANT WANTED—Share basis on small dairy ranch. Also take care adjoining orchards; wage basis. Beautiful location. New buildings. Excellent opportunity. References required. Give full particulars, experience, family, equipment, etc. George S. Henry, Oakdale, Stanislaus Co., Cal.

TO LEASE—Fine dairy property of 1600 acres in Northern San Joaquin County. 500 acres in alfalfa, plenty of feed. Will carry 250 to 300 cows. Fine opportunity for dairyman owning a herd. Address Owner, A. H. McHuron, 149 New Montgomery St., San Francisco.

STATE SCHOOL LAND MAP, \$2.50—County Sectional Map showing Government land, any county, \$2.50. Free New August Booklet. Write Joseph Clark, Experienced Record Seacher, Sacramento.

HAVE 50 ACRES fine irrigated fruit land Will make very attractive sale offer to practical orchardist with some capital. Address R. T. Romie, Soledad, Monterey country.

FOR EXCHANGE—80 acres of fine alfalfa land for Holstein dairy cows or young stuff. Sturgeon Bros., Route A, Box 61, Lemoore, Cal.

GOOD BYE! Morning Glory

Don't let this troublesome weed sap your soil and ruin your crop.

NONPAREIL

is the one sure exterminator that does the work without injury to the ground. Read what Luther Burbank says: "We find that Nonpareil destroys not only morning glory but also horse-radish. We consider it a thoroughly satisfactory weed exterminator."—Luther Burbank.

One gallon of Nonpareil is sufficient to kill 250 plants. It does not prevent the ground from producing regular crops. It acts as a tonic to the soil. It is easy to apply and economical to use. Write today for interesting folder on this profit saver.

Wheeler Reynolds & Stauffer
 625 California Street
 San Francisco, California

P. & O. Power Lift Engine Disc Plow

P. & O. Implements, as usual, lead the field. The engine disc plow illustrated above is THE FIRST POWER LIFT DISC PLOW to be put on the market.

Having been subjected to the most rigorous tests under actual working conditions in the field, it is not an experiment, but a demonstrated success, and owes its success in a measure to the incorporation in its construction of many of the essential features previously found only in the P. & O. LITTLE GENIUS Mold-Board Plow, the first and most successful power lift ever sold in California.

WE ARE SPECIALIZING ON TRACTOR TOOLS, and carry the best assorted and most successful line of implements for small or large tractors in the State. Write us for circulars and information on the following lines, which are among our leaders.

P. & O. Power Lift Engine Disc Plows (2, 3 and 4 discs).
 P. & O. Little Genius Power Lift Engine Moldboard Plows (2, 3 and 4 bottoms—12 and 14 inch).
 P. & O. Little Genius Orchard Pattern Plows (3 and 4 Bottoms—10 and 12 inch).
 P. & O. Junior Engine Plows (3 and 4 Bottoms—12 and 14 inch).
 P. & O. Senior Engine Plows (4, 5 and 6 Bottoms—12 inch only).
 P. & O. No. 3 Star Double Disc Harrows (All sizes, 4 to 10 foot, 18 or 20-inch discs).
 Imperial Heavy Duty Rigid Frame Double Disc Engine Harrows.

BAKER & HAMILTON San Francisco, Cal.

Our Tractor Tools Can Be Seen in Actual Use at the Tractor Demonstration at the State Fair, at Sacramento, on September 4th.

The New Way of Farming

is the **BIG BULL** way

HERE IS REAL PROOF---ALL WE CAN GET ON THIS PAGE

You can write or talk to any of the California owners whose names are printed on this page. You can ask them about any special feature of the construction or operation of the Big Bull. Make special inquiry regarding these points, many of them exclusive with the Big Bull Tractor. Self-guiding; Bull wheel in the furrow; Subsoiling; Speed and number of acres plowed per day; Powerful dependable motor; Accessibility to motor; Ease of operation; Simplicity of design; Service given by manufacturers. If there has been at any time the least doubt in your mind regarding the value of a Big Bull Tractor to your farm, let the facts, as you can obtain them from the following men who have farmed with Big Bull Tractors, convince you that the thing to do is to buy a Big Bull Tractor, and buy it now before there is a shortage due to the scarcity of raw materials. (In writing to these men please enclose stamp for reply.) **SPECIAL NOTICE**—We want to offer an apology to the Bull Tractor owners whose letters do not appear—Space did not permit of printing more than a fraction of the many received.

Elmira, Solano Co.
I find my Big Bull Tractor will take the place of eight horses and do the work much cheaper. When not at work it is no expense. When horses are not at work, it will cost 25c a day to feed them hay. That is putting it low. When at work they need hay and grain, and the least it will cost will be 75c a span to feed them. That is, if you raise your own feed. I can run my Big Bull one-third less time, and plow from 2 to 2½ acres more than I can with an eight-horse team. So you see it is a great saving in expense and also in time. I can pull two 14-inch gang plows, or three 10-inch gang plows with ease, or a four-section harrow, that was built for an eight-horse team.

I am satisfied the cost is one-third less than with teams. For sawing wood, the Big Bull is a dandy, and in pumping water, the Big Bull can not be beat by any engine made. It will pull a six or seven-inch pump with ease, and run as steady as a clock. I am very much pleased with my tractor and I think all my neighbors will soon use them.
L. C. NORTHUTT
Lock Box 125.

Dixon, Solano Co.
I have had no trouble with the tractor in any way.

Mr. Shafer asked me for some kind of a testimonial. He didn't say what kind he wanted, but guess he was absolutely sure of the brand he'd get. I'll do that for him and express a lot in mighty few words.

The Big Bull Tractor is all there, and its batting average is 1000. I might go on with a letter in letting you know what I have done with it, but what's the use? You know and I know, they can't be beat.
N. P. & H. M. WILLIAMS.

Rio Linda, Sacramento Co.
I have graded roads with the Big Bull and I have plowed with it, disked with it. I have run a 5-inch pump for irrigation, and I am leveling land for irrigation at this writing.

I have not had any trouble but what we could solve, that is, my son and I. I am very much pleased with the Big Bull so far and others that previously knocked the Bull Tractor if they were in the market for a small tractor now, they would get a Big Bull. Well, this is all I have to say about the tractor at this time.
A. GENTRY.

Elmira, Solano Co.
The Big Bull is doing good work and am not having any trouble so far. If your service man happens in this part of the country would like to have him call as there are a few things I would like explained that I do not understand very well. I can do anything on the ranch with it that they can do with horses and a lot of things that horses can't do. I have plowed, harrowed and disked, sawed wood and this summer I am pumping with it. It has fine belt power and runs all day without any bother, and only costs \$1.50 for distillate and oil, that is for 12 hours. I have given it a good try-out and will say that I wouldn't do without one on a small farm. It is the handiest thing a man can get.

I pull two 12-inch plows and go three miles per hour, and I make 4 miles per hour on the road with hay, where with horses I can only make 2½ miles per hour.

Some people think that I like to show off, but I bought it for all kinds of work, and work it will have to do as we only have two horses.

As soon as pumping is done with I am going to grade land, as it pays to fill up the low places. I would like to see all the big places cut down to 80 or 100 acres, and a Big Bull on every place. I had a 10 H. P. engine to pump with, and all my neighbors could hear it for miles, but now with the Big Bull they don't know when I start or stop.

SERVICE

We invite comparison with tractors costing from \$500 to \$700 higher.

\$645.00 F. O. B. Minneapolis

If you have not received new literature on the Big Bull, write us, and also send for a three months' trial subscription to the monthly Bull Tractor Bulletin, Dept. AS.

HUGHSON & MERTON, INC.

530 GOLDEN GATE AVE.,
SAN FRANCISCO.

1229 S. OLIVE ST.,
LOS ANGELES.

Since I have had the tractor it has made more money for me than 8 horses. It is the handiest tractor made for all kinds of work.

SANFORD MCMAHILL
Maxwell, Colusa Co.
Enclosed find check for distillate burner. It is great. We started on a twenty-acre field at 6 p. m., ran until 3 a. m., started up again at 9:30 a. m., and finished the 20 acres at 3 p. m., making 14½ hours.
WILLIAM HAGAN

Courtland, Sacramento Co.
The tractor works fine. Plowed 150 acres, placed a Chink (Chinaman) on the tractor, and he did the rest with a little directing now and then. He expressed it by saying, "Heap good."

CHAS. E. HUSTLER.

Sheridan, Placer Co.
In regard to the success with my Tractor No. 7837 will state that I am very well pleased. Have been working right along without much trouble. In regard to the work I have been doing: I have plowed 260 acres, pulling a two-gang Columbia 40-bottom and one section of harrow, plowing on an average of 8 acres a day, burning about 20 gallons of distillate and one gallon of oil. Pulled a 12-foot disc harrow in river bottom land, which is very loose; pulled a 9-foot spring-tooth harrow in very hard ground. Will say that the Bull-with-the-Pull has done very satisfactory work for me.
J. RUFFINELLI.

Willows, Glenn Co.
In regard to the work my Bull Tractor is doing, it gives us great pleasure to write you of the excellent work it did this spring while we were sowing rice by means of Gorams. At the beginning of rice planting, we had four 14-inch Goram Seeders, two being hauled by six (6) mules each and two by one Bull Tractor to each seeder.

The seeding was being done between contours which necessitated numerous turns, in making which the six-mule teams lost considerable time at each turn, but the Bull would make the complete turn in a much shorter length of time. Due to the greater speed at which the Bulls traveled and their quickness in turning each Goram pulled by a Big Bull would do about twice the acreage that the Gorams pulled by the six mules would do: as the stock cost 90c per day a head, besides the cost of feed, the seeding done by the Big Bulls was much the cheapest and the most satisfactory.

THE SPALDING CO.

SIMPLICITY

Brockman, Lassen Co.
I have had a Big Bull Tractor since last summer. I had to work him hard, as we have the worst kind of "dobe" in this country. It is just like rocks when dry. I had many farmers tell me that I could not plow now, while I was doing it every day. I have run the Bull with 20c gasoline and made money by it. (Freight up here costs more than gasoline and more than most anywhere in California.)

I don't know how much gasoline it takes per day, but think the average was about 12 gallons for a ten-hour day. I am sure it has taken more some days than it did others, and I blame this all to my inexperience, as I did not know anything about tractors, and very little about gasoline engines. Had no repairs, except a few bolts, which I lost.

Would not exchange Bull for any other tractor now, nor for an eight-horse team, if I should keep them on the farm, as the Big Bull will work them to death in less than one season.
WILLIAM KEMPER

Newbury Park, Ventura Co.
I purchased a Bull Tractor from Hughson & Merton nearly one year ago, started it out pulling a Steel King Hay Press which, when equipped with self-feeder, dropper, etc., required a large engine. The Big Bull did the work easier, than any 20 H. P. engine I ever used, giving a perfect steady running power from morning till night.

I used it two months at this, then plowed some in Oxnard vicinity; then ran it to Newbury Park, and plowed 200 acres for myself, 35 for Mr. Heckman, 100 on the Frederick Ranch, and 60 on the Petranos; then gave it a good overhauling and began running the Steel King Roller again. It went nearly all the time and lots of the time day and night.

I plowed more land with a four 10-inch Stockton gang in six hours than eight horses could with the same kind of a plow in ten hours; the eight horses cost me \$5.50 per day for feed, the Bull cost me barely \$3.00, and the first cost of the horses was more than the Big Bull. In answering some questions asked me by the Farming Department, Washington, D. C., about the tractor, I said it was the most powerful for the money that had ever come west of the Rockies. If you all know them you would all buy them.
S. L. MARTIN.

Corcoran, King's Co.
Just a few lines in regard to the Big Bull which I purchased from your agent, Mr. E. J. Cutting, last fall. I wish to say that we did eight-horse work in he field with it, pulling two double discs on the alfalfa, and plowing with a four-disc plow for grain, plowing from five to seven inches deep. Had no trouble to speak of at all, and, by the way, when we hooked the Big Bull to the 7-inch pump, the way he made the water roll was a sight.
MELVIN WORKMAN

Compton, Los Angeles Co.
We own Big Bull Tractor No. 7904, and will say we are well pleased with it. We have exceedingly heavy ground to work. Plowed 70 acres, pulling one 14-inch bottom on an average of 14 inches deep; the same plow we have been using five good horses on, and the Big Bull did the work easier and faster by about one-third and about one-half the cost.

We also pulled a ten-foot disk harrow over the ground this spring to prepare our seed bed. In fact, we did about all our farm work, except planting, with the Big Bull.

We are now using the Big Bull to run a No. 5 American Centrifugal Pump, discharging 80 inches of water for twelve hours a day, using pure engine distillate at two gallons an hour with your standard carburetor on distillate attachment, and believe me, Big Bull does the work and does it easy.
F. M. LEE & SONS.

Sunnyvale, Santa Clara Co.
I own a Big Bull Tractor and have used it about a year in my 90-acre prune and cherry orchard, and am well pleased with same. It consumes between 14 and 15 gallons of engine distillate per day at a cost of 8 cents per gallon.

The Big Bull tractor will do the work of seven good horses at a cost of \$2 per day, and when standing your expense stops, while the expense of horsepower goes on 365 days of the year, which is much greater than the running expense and the up-keep of the tractor. The up-keep of the tractor is very small on account of the simplicity of its construction. There are but four driving gears which make the cost very light and also give more power than the tractor with its many complicated gears.
H. G. STELLING.

San Jose, Santa Clara Co.
In regard to the use of the Big Bull, I plowed ground this year as hard as the county road, and had some lumps as large as a bushel basket, but succeeded in getting my places nearly as fine as dust by using P. & O. Gang Plows, double disc and clod masher, pulled by the Big Bull Tractor.
TARRANT PUTNAM.

156 N. 5th St.

Felix, Calaveras Co.
Our Big Bull has answered every purpose and it is beyond a doubt one of the best little tractors on the market for the money.

J. H. COCHRAN.

Greenfield, Monterey Co.
I have been using a Big Bull Tractor the past two months and am highly pleased with it. It pulls a 4-bottom, 10-inch Stockton gang about five inches deep in stubble land for sowing barley. With this outfit I plow about an acre an hour or about 10 acres a day and burn about 20 gallons of distillate and 1½ gallons of oil in doing the work.

I have plowed about 550 acres with this engine and have never had to adjust or take up any bearings yet and feel certain that with reasonable care and attention the matter of upkeep need not cause any worry to the owner.

HORACE L. CLARKE
(Mr. Clarke has used his tractor for 64 hours straight without a stop on an 8-inch centrifugal pump, and is now running a thresher with it.)

Tractors are cheaper to work than horses---it doesn't matter which make you buy you will save money---only with a **BIG BULL**, you save more.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

AUGUST 26, 1916.

LOS ANGELES

Six Decades of California Fairs.

Twelfth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn From Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

WITHIN two years after the first rush of the gold-seekers, that is "in '49 and the spring of '50," there was held in San Francisco, a mushroom town of miners and their promoters and pillagers, an agricultural fair for the exhibition of the products of the new State, which, at the time, was generally believed to be of no agricultural account. We have no record of the time of it except that it was in the fall of 1851, nor the place of it except that the orator, of whose address we have a copy before us, say, "Let us cast our eyes around this hall;" but whether it was a gambling hall or a church we do not know. Teamsters of both the Lord and the devil are known to have been early on the ground, intent on hauling, either from the pit or into it. But it was an agricultural fair, for the orator alludes to products arriving from Sonoma and Sacramento valleys on the north and from Los Angeles on the south; products of great diversity and of dimensions incredible to those who did not see them. And there was a silver cup awarded to John M. Horner, who, in the Alvarado region of Alameda county, produced, as the orator says, "at a cost of about \$50,000, a crop of field vegetables and grains worth at present prices, some \$200,000." Thus the first California fair recognized and rewarded the man who struck the keynote of the large in California farming by making a profit of 300 per cent. But lest this brilliant instance of the success of frenzied farming be overworked by promoters we hasten to add that another historian says: "The onion and potato fields of 1851-2 made their owners rich; the same fields in 1853-4, with excellent crops, ruined their owners"—for the production was beyond all local powers of consumption. What, then, can a farmer do in a country where things grow so big and people eat so little?

Getting Together. — To help each other answer the puzzling questions of what

will the local conditions of soil, moisture and temperature grow successfully and what can be profitably done with it when grown—the pioneers, who took to farming, began at the very first to get together, like the Athenians of old, "to tell and to hear some new thing"; and above all they desired to see also. And so there came to be farming assemblies very early; and exhibitions also, other than the first of record, to which we have referred. The chief immediate result, was an appeal to the State legislature of 1854 for the establishment of a "State Agricultural Society." Much quiet pressure was exerted upon the law makers of a

State whose eyes were naturally largely occupied with the gleam of gold and much rural eloquence was poured upon them. From such a stream set free by Dr. C. V. Winslow, we catch these glistening drops:

From the broad declivities of the Sierra Nevada to the rock-bound shores of the neighboring ocean and from the icy summits of the Siskiyou to the sunny vales of the south, the geni of rural wealth lift their smiling faces from the soil and proclaim that law-giver the greatest benefactor to the commonwealth who advocates the most liberal enactment for founding agricultural institutions to stimulate agricultural enterprise.

Whether this broadly geographical metaphor, so ancient in political oratory, was ever invoked in behalf of farming, before Dr. Winslow flashed it before the legislature of 1854, we do not know, but "it worked fine" in its way. The society was created by a law passed nearly unanimously by the assembly, by a vote of 18 to 8 in the senate, and approved May 14, 1854. The society was given an appropriation of \$5,000 annually for four years, "to be used only for the paying of premiums." It was also provided that if the society should fail to hold a meeting for two years, all its real and other property should be sold under execution and the proceeds placed in the State treasury, whence only an act of the legislature could educe it. Thus the State prevented its own money from being used to acquire property and arranged to grab all the property which the society might otherwise acquire.

Fairs of the First Decade. — But the pioneers seemed not to be depressed by their hard bargain with the State, though they might have been otherwise discouraged if they had been less hopeful and determined. The (Continued on page 204.)

EDITORIALS

OUR STATE FAIR.

WE HAVE been giving many days to continued research and thought about what California has been doing, ever since her birth, for industrial development through an organized agency, whose chief manifestation in the public eye is the State Fair. Of this organism the State Fair is the blossoming; the roots and stem are in popular appreciation and support; the fruit is to be found in public prosperity, which is, of course, the sum of individual prosperities. As we have been looking into this matter carefully in the light of the experience of the last sixty years, and as we try to project something permanently valuable to the State upon the foundation of this experience, it becomes very clear to us that the State government should, at the first possible moment, take up and liberally provide for reorganization and extension of the work of the State Board of Agriculture, so that it can adequately discharge functions which are now almost essential to the future development of the State in all industrial lines. It may be claimed that such intimation of scope is too broad and that it should be restricted to the agricultural line, but we doubt if such objection is well taken. The term "State Fair" has nothing distinctly agricultural in it, although agriculture predominates in the popular understanding of it, because, for half a century, agriculture has been our greatest industrial attainment and our greatest hope. But agriculture was attended by mining, mechanics, manufactures and trade in the very first movement of the State for its own development, and they have never been lost sight of. The first appropriation of public money ever made, that of 1854, was for "an exhibition of agricultural, mechanical, domestic manufactures and productions, and for no other purposes." And the broad symmetrical development of her industrial resources, which the California pioneers conceived and provided for, is the everlastingly true view, and therefore we contend that the State should broadly provide for it.

THE PRODUCERS' POINT OF VIEW.

THE fundamental reason why we contend for a potent and distinct effort of the State for industrial development, as an executive function of the State government, is because we discern the need of maintaining a producers' point of view in public discussions and transactions. To secure symmetry in development and real equity toward all who are interested, it is necessary that the point of view of those who are doing things should not be merged in the point of view of those who are investigating, thinking, and teaching about things which they do not themselves do. The latter is the academic point of view, and for the former point of view we can think at this moment of no single descriptive word. It is sometimes called "practical," but that word we dislike, because we very well know that views which are put forth under that guise are often less true, and therefore really less practical than opposing views which are of academic origin. If we could limit

the word practical to its source in practice, it might serve our present purpose, for then it would not beg the question of truth or error, with which we are not concerned at all in this connection. Let us say, then, that in the present, rapid building-up of sources of academic points of view, we are shooting the public eye so full of academic gleams that it can discern no other source of light, and this is not wise nor just to the academic interests nor to any other. Non-academic achievement, even though it be reached through light of academic research and instruction, is entitled to its own point of view and to appreciation of its non-academic contribution of experience of its understanding of environment and of its "coming through"—every item of which enters finally the academic treasury and is joyfully receipted for. It is all different from academic achievement, though finally merged in it, and it is therefore entitled to its existence and influence as a producer's point of view.

THE STATE SHOULD PROVIDE FOR IT.

THE State is providing most generously for the installation and equipment of the academic point of view in agriculture, the national government is supplementing the gifts of the State and the counties and individuals are helping to make all these provisions operative. A splendid system of academic operation is being built up, and its influence upon general prosperity and individual advancement will be almost incalculably great. It will now be wise for the State to provide lenses through which producers' points of view can be concentrated upon problems which should be held non-academic and called executive, protective, promotive, legislative—or, if you like, the "practical" aspects of things to be done—with the reservation about the word already noted. And this work should be centered on the basis now occupied by the State Board of Agriculture, and its great blossoming event in the public eye should be the State Fair. Its operator, either an individual or a board, should be constituted the industrial branch of the State government. It should be at work all the time upon problems which must be approached from the producers' point of view, and, upon such issues, should be the competent advisor to the governor and to the legislature. It is sadly confusing and exceedingly expensive to have a host of State officials messing away at concerns which are mixedly academic and executive, and perhaps the worst of it is that, in the present ascendancy of the academic motive, proper executive functions are not appreciated nor discharged, and even legislation itself is unduly influenced by the academic point of view, and the producers' point of view minimized or wholly ignored. The State now has a fine property and improvements for the equipment of a great promotive and regulative institution which shall serve producers' needs and opportunities, and contribute grandly to the development of the State in ways the pioneers dimly discerned, but which now lie in clear sunlight. Go to the State Fair, then, and while you are enjoying what you can of what it now is, think earnestly of what it ought to be.

RETURNING TO WHEAT.

BUT lest readers weary of our kind of statesmanship added to the other kind, which they are now getting in copious doses from presidential campaigners, we turn to something more concrete, and that is wheat. It seems very timely that the announcement should now come that Solano farmers propose to make their county again famous for wheat. Their attention has been awakened by the request for more home-grown wheat from the superintendent of the Sperry Flour Mills at South Vallejo. The Sperry mills have been forced to secure wheat from Washington, Oregon, Idaho and Kansas during the past few years, as California has come to produce less than half the wheat needed by our mills for local consumption and for their export trade. We have exhorted our readers previously on the desirability of more wheat-growing, and the coming year certainly seems a good time to start in, for European wheat-growing is considerably upset, and this year's world product is estimated by the International Institute of Agriculture to be 25 per cent less than

last year's crop or than the normal—we are not sure which, for we have both statements cabled. At any rate it is a quarter less than something, and that is a good deal. And so we shall be glad to ride through stretches of wheat again in Solano county rather than through stretches of idle land we have recently traversed. It is well also to remember that not only do we need wheat to eat, but we need as great an increase of the milling industry as we can get, because, while we are saving money by eating our own flour, the mills give us great volumes of mill feeds which we need to make milk and meat, and thus by eating our own flour and selling flour to others, we get plenty of things to eat with the wheat and by feeding the by-products of wheat we also get more manure for the land, and thus go farther in rational farming.

OH, THE POOR MIDDLEMAN!

THE poor middleman must feel lonely; no one seems to want him. Farmers became tired of him long ago, and have been making more or less frantic efforts to pry him loose from his absorbing job, and some of these efforts are succeeding quite well. But all the time farmers have been trying they have been told by commercial mentors and tormentors that if the middleman were torn off the pipe he has made the whole business would run away through the hole. And we have sometimes been scared into admission that, after all, the middleman may, perhaps, be necessary, and, if so, then he ought to be regulated as to the size of the hole he bored for his own benefit. But now we seem to be impelled to the conclusion that the best way to cuddle the middleman must be to knock him in the head. And we surely could not reach that dreadful conclusion by our own bravery. When, however, the conclusion is offered us by those who are recognized as masters of high finance and high commerce, how can we longer admit that the middleman may be necessary? The great canners' merger, of which we gave a hint last week, seems to be going ahead finely, and has heaped up a fund of, perhaps, twenty-five million dollars, with which it proposes to swallow all its component parts at more than 50 per cent above their par value. And what are they doing it for? We do not know of ourselves, but Charles Remington, who knows the wild beasts of finance very well, says this:

The question has frequently been asked as to what economies would be effected by the merger of fruit canneries, pineapple canneries, salmon packing establishments, etc., none of which is engaged in the same kind of business. It is pointed out that the chief economy would come through the elimination of duplicate distributing organizations. At present, the cost of getting these wares into the hands of retailers is a large part of the aggregate cost of conducting the business. This has led to the conclusion that the combined properties are being assembled in the interest of some concern already having an organization for the distribution of food products.

We take it that the words "elimination of duplicate distributing organizations" is high commercial language, which means "fire a lot of middlemen." It cannot mean to get rid of bunches of hard-worked and under-paid clerks and roustabouts, for that would not be worth twenty-five millions, or any part of it, because about the same number of such functionaries will be required to handle the same volume of products under any system. Therefore, we conclude that there are only two excuses for such costly re-arrangement: one is to cheapen the buying of materials for canning by ruling out competition for it; the other is the sloughing off of a lot of distribution pipes, each riddled with suck-holes for middlemen. For the

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 22, 1916.

STATIONS	Part Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	1.46	.14	81	48
Red Bluff	0	.63	0	102	50
Sacramento	0	.07	0	93	54
San Francisco	0	.25	.01	84	62
San Jose	0	0	.02	92	71
Independence	0	0	0	90	48
Fresno	0	0	0	100	54
San Luis Obispo	0	0	.03	80	46
Los Angeles	0	0	0	76	56
San Diego	0	.02	0	70	58

present we accept Mr. Remington's statement that the latter is the real reason, because we do not care for the other at this time. And our conclusion is that we have the dictate of high commerce that the middleman is not necessary to the "getting of wares into the hands of retailers," and therefore the ends sought by million-dollar growers' corporations and twenty-five-million canners' mergers are the same, and both of them good commercial procedures. Henceforth we hope to hear less of the divine rights and indispensability of middlemen.

THE FARM LABOR OUTLOOK.

HERE seems to be a general anticipation that the farm labor supply for the coming year is likely to be short. It was authoritatively stated recently that the number of Japanese in California is decreasing, and those still here are becoming less available because of their disposition to get into business for themselves. Last week, H. P. Stabler, horticultural commissioner of Sutter county, received word from A. Caminetti, United States Immigration Commissioner, that farmers can no longer depend upon Hindu and other imported labor in any quantities. He declares few Hindus are coming into this country, and the few other foreigners now arriving are going to the cities instead of to the country. Mr. Caminetti suggests the opening of farm labor registering bureaus in the interior towns, and such an agency has been opened at the Marysville Chamber of Commerce. There seem to be two reasons for knowing what can be done with men who are available. One is that if it is known that men can be used now or soon, those who are set free by the close of harvesting may be placed and kept in the rural communities instead of making their autumn rush for the cities as they are apt to do when no jobs are in sight. Another reason for making known future need for men is that they may be sent out from the cities continually, and thus part of the winter accumulation be prevented. If we are to be in short supply next season, it is none too soon to begin planning to make the best use of all that is available, and the community which holds on to its present supply will be advantaged. It seems to be a matter which all local agricultural organizations should take into consideration.

Siloing Corn Stalks.

To the Editor: Can you furnish me with reliable information of the feeding value of corn fodder ensilage? I have read it makes very good feed for milk cows, if properly cut and shocked. I have 40 acres, and intend going in the dairy business, but did not plant any corn this year, but can get all the fodder I want for the cutting and shocking. Will it pay me? I would like to know soon, so I can commence building my silos.—C. A., Santa Rosa.

A few reports of satisfactory experience in siloing dry corn stalks have come from the Central West, but we are not aware that success has been fully demonstrated or measured. As for available nutritives, analyses show that the mature corn plant (as a whole plant) has its maximum when the corn is ripe, and this is a sound foundation for the practice of cutting the plant for the silo considerably later than was at first thought desirable. It is also shown that corn stover (that is the ripe stalks with ears removed) is a better feed than was at first supposed, and that a "corn shredder" may add nearly a quarter to the benefit the animal will get from the same weight of whole stalks. It would, therefore, be a question in your case whether you should try siloing or shredding the stalks which you mention. With the assurance that they would be good roughage in either case—to be fed, of course, with milk-making concentrates. As, however, you wisely propose to build silos for future use, you assume little risk if you build one now and use it for siloing the stalks and make your own demonstration of the value of the practice. You will remember, of course, that in siloing dry stuff considerable water must be used, and this must be thoroughly mixed with the finely cut stuff, and not simply run into the silo to go to the bottom. The best way probably is to run a small stream into the blower pipe and blow it into the

silo with the cut stalks. Unless there is water enough and skillfully applied, you stand a good chance to get a silo full of manure.

Protecting Potatoes.

To the Editor: How can we keep our potatoes through the fall and winter till the new potatoes come, without sprouting? Will fumigating with carbon bisulphide kill the worms already in the potatoes and prevent others from working in? This is the treatment we employ for bean weevil.—C. D. H., Santa Cruz.

We know nothing but cold storage which will keep potatoes dormant. Keeping in a cool, dry place will retard but not prevent sprouting. Bisulphide, if the fumes are held on the potatoes for 24 hours, will kill all worms, and 48 hours will kill all eggs present at the time. It will not prevent the moth from starting others later, if she can get access to the potatoes. If you can cover or screen her out that will settle the business. The moth likes the California climate well enough to be active most of the year!

Pollination of Prunes.

To the Editor: Will French prunes pollinize Imperials, and will Imperials pollinize Robes, and vice versa? If they will, how should they be planted—in blocks, each variety to itself, or by alternating the varieties in rows? What other variety would be well to mix in?—W. G., Yuba City.

We understand that the University pomologists have been trying some experiments this year to show the attitudes of the different prunes to each other in pollination, but results are not yet available. It has been the current belief among growers that the French prune is self-fertile; that the Robe is helped by association with other varieties, and that the Imperial is undetermined—for its shyness is apparently due to other causes, such as thrips, etc., to which it seems to be particularly subject. It needs definite demonstrations to settle your questions. We should plant prunes in blocks of, perhaps, five rows, and alternate the blocks. In that way one might get all the advantage there is in pollination and lessen the danger of mixing varieties in gathering. What variety is entitled to rank as best cross-pollinator is not determined.

Blasting in Vineyards.

To the Editor: Might blasting near four-year-old Thompson vines prove of value? In some spots of my vineyards vines have not grown well. I have applied manure without great results. I attribute the trouble to hardpan near the surface. Is there any danger of killing the vines by blasting too close to them?—G. W., Yuba City.

Blasting between vines was satisfactorily and beneficially done by the late James Rutter of Florin about forty years ago. He was careful to make the holes midway between each four vines and succeeded in shattering the hardpan without injuring the vines; in fact, he notably improved their growth and bearing. That was a case in which a definite plate of hard pan lay near the surface and over a free subsoil to which roots were enabled to penetrate and surplus water to escape by the blasting. Of course, one has to be wise as to the amount and character of powder used. It is now the time to do it, so that coming rains may resettle the ground enough.

Surety of Kind in Grafting.

To the Editor: In grafting young prune trees, is it necessary to have wood from bearing trees?—Beginner, Marysville.

It is not necessary from the point of view of getting a grafted tree, but exactly what kind of fruit the tree will bear depends upon taking scions from a tree which is seen to be bearing the kind of fruit you desire. Of course, an experienced grower may recognize the characteristic wood and leaf growth of a variety, but this will not show whether the fruit is a good type of its kind. Therefore, in taking scions one should know whether the parent tree is bearing the right type and is prolific at it, and only the observation of the tree in bearing gives that knowledge. This test is not widely insisted upon, perhaps, but it ought to be. Propagation should be only from the best trees.

Dodder and Frost.

To the Editor: Will dodder in alfalfa be killed by frost? If so, how cold would it have to be, provided the alfalfa was cut down as close as possible late in the fall? I have kept the alfalfa cut close at frequent intervals, and do not think the dodder has had, nor will have, a chance to go to seed.—J. M. H., San Francisco.

Frost will not kill dodder. It thrives wherever alfalfa grows—in Europe, the Eastern States, etc. Frost cannot kill out dodder because this year's dodder will probably be dead before the frost comes. The plant has no perennial root; each generation has to come from the seed, and seed that ripens late will remain dormant over the winter. The danger that you may not kill it out by cutting lies in the fact that it may make a bloom or two below the cutting point, and the bloom is so small and inconspicuous that you may not notice it. But the chances are that you may exclude it by close cutting.

Failing Raspberry Hybrids.

To the Editor: I send living tips and dead canes of some of my raspberry bushes which seem to be failing. For the last eight years the bushes have grown higher than my head. This, the ninth year, they are not more than two or three feet tall and many of them began to die almost as soon as the berries began to ripen. What is the matter with them?—Grower, Marin county.

We do not find anything on the specimens you send to account for the failing, thrift of the plants which you describe. There is no sign of parasites on these parts of the plants. It is likely that the trouble is in the soil or in the roots. You should look at the roots for swellings or other signs of root-pests. If you do not find them it is possible that you have been using the same ground too long for berries. If you have not manured the ground it is probably worn out for berries, which like to be fed well. Whether you find root troubles or not, it would be desirable to take the best of the healthy young plants and re-set them on new ground and use the berry patch for growing vegetables for a few years, using plenty of manure and after that it can be planted with berries again, if you desire.

Collapse of Eggplants.

To the Editor: Please tell me if eggplants are thirsty or better handled with an amount of moisture that satisfies tomatoes. My eggplants are inclined to go pale and rusty and succumb—a nuisance when selling fruit.—E. E., Yountville.

Our observation is that eggplants can be given water liberally with less danger than tomatoes. The fact seems to be, not that the tomato plant does not like water but likes it too well and therefore gets so riotously drunk that it kicks off its blossoms so that it can give all its energy to imperial expansion, as it were. The eggplant does not seem to be so hotheaded and is better inclined to turn more water into larger fruit. But from what you say of the aspect of the plant we apprehend that it is not a question of more or less water. The eggplant is subject to fungous invasion and to other organisms which are little understood which cause collapse. So far as is now known the best treatment is avoidance—by planting each year on soil not recently occupied by the plant.

Farm Loan Associations.

To the Editor: We are taking steps to form a Farm Loan Association and would like to know exact rules and probable interest rate for California.—E. A. G., Merced.

As we have already said, the farm loan business under government auspices cannot actually begin until the Farm Loan Board organizes the machinery and issues certain regulations which the law provides for. Much can be learned toward organization by the careful study of the law itself and applications for copies of that can be addressed "Farm Loan Board, U. S. Treasury, Washington, D. C." Such an application will probably bring subsequent publications concerning regulations, etc. The interest rate is still to be definitely established through the district bank for this district when it shall be established.

Six Decades of California Fairs.

(Continued from first page.)

first State Fair was held in San Francisco in October, 1854, with a cattle show at the Mission and an indoor exhibit in Musical Hall. The fair of 1855 held its display of farm products in the Assembly Chamber in Sacramento and its cattle show at the Louisiana Race Track. There were no publications by the society about the fairs of 1854 and 1855, and it is impossible to discern the exact truth about either of them, but it is probable that the displays were smaller than expected. It is on record that premiums amounting to \$4,660 were paid in 1854 and \$6,650 in 1855, but as some awards were as high as \$75 and \$100, and the common run of first premiums was \$50 and seconds \$25, it would not take many exhibits to get away with that much money.

As nearly as we can judge, the first really good exhibition was the third State Fair held in San Jose in 1856. The fourth, in 1857, was held in Stockton, the fifth, in 1858, in Marysville; the sixth, in 1859 in Sacramento, and a contemporary record says, "the State Fair returns to Sacramento never more to travel." The real fact is that in that year a most fierce fight arose as to whether the State Fair should be permanently located at the state capital or should continue to be peripatetic. The question was overwhelmingly foreshadowed by a mail-vote of all members in 1860, Sacramento receiving 431 votes against a scattering of 4 for other places in the State. This result was predestined by the fact that Sacramento had raised by special tax \$30,000 for the erection of a pavilion, and provided also land for races and stock shows which the State appropriated \$15,000 to improve; also by the fact that Sacramento had a vast majority of the voting membership. The question of permanent location thus decided, arose occasionally afterwards in seasons of discontent over various issues, but never assumed very acute form. All the regular State Fairs since 1859 have been held in Sacramento, though special exhibitions, such as a run of "citrus fairs," have been held under the auspices of the central society in other parts of the State, as provided in various appropriation bills passed by the legislature.

It will be obviously impossible to look into the details of about 60 regular State Fairs, to say nothing of special exhibitions, nor would readers generally have patience to pursue the results of such an undertaking. We have about 50 volumes of the "reports," which are a treasury to be drawn upon when one needs special facts or points of view belonging to the agricultural development of the State. The State Agricultural Society has, in fact, written much history of which we have no other record, and its service, in this respect, will grow in value as the years run on. In this connection we shall only discuss a few points which are either unique or formative in the character of the society, as it has thus far advanced on its career.

The Visiting Committees.—From a historical point of view the most important work which the State So-

ciety has ever accomplished is to be found in the reports of its "Visiting Committees" which traversed the State, noting the achievements of the pioneer fruit-growers and farmers. This research began in 1856 and continued until 1861. Naturally, looking backward in the case of each achievement, efforts were traced to their very beginning. This was an original undertaking, and recognized to be such, for it is stated in 1859: "We are not aware of another instance in which a society, through visiting committees, has undertaken to explore and examine the mining, agricultural, mechanical and manufacturing interests of a vast State, and place on permanent record full details of its extensive and varied resources. This novel work was brought into being by the peculiarity of our circumstances." When one remembers that travel in those days was wholly by private or stage teams, except now and then with a lift on a river boat, it is easier to appreciate the effort to thread the State from sea to mountains through its entire length, seek-

and "heal all differences, unjust rivalries and petty jealousies that have grown up between us and every part of the State." At the fair of 1860 the president, T. G. Phelps, said: "This society has offered premiums for a multitude of neglected products to put a stop to importation. It is humiliating that we are receiving from New York and Boston large supplies of cured meats, while carcass beef is worth hardly half as much here as there. We are shipping barley to New York, a distance of 17,000 miles by sea, and receiving in return, pork, hams, bacon, and lard made from grain of the same grade, while it has been demonstrated that they can be cured in this climate as well as in any other." And the president would surely have felt humiliated if he had known that the same sort of thing would prevail, to too great an extent, even half a century later, and that we would stand today, hoping the same old hope, but fortunately far less hopelessly, for great production and export have been attained as the result of the pioneer efforts.

A Great Drive for Home Production.—Probably no state has ever made a greater effort for home production than the California legislature of 1862 authorized the State

quadrupled for greater quantities produced. We do not find that any such premiums were either claimed or awarded. The State therefore had its great run of publicity for less than one-tenth of its money. Agriculturally, nothing but the stimulation of hop growing can be connected with the offer in any way. The present rice, cotton and tobacco growing, arising more than a third of a century later, rest upon other foundations entirely. It is clear to see now that the great awards of 1862 were either for achievements then economically impossible, or for other achievements which will always be physically impossible in this state. Even our great sugar production of today is entirely disconnected, because the State offer was projected upon the basis of tropical sugar-cane—the growth of which in this state was a dream, like that of coffee and indigo.

The fairs of the second decade went through quite as well as one could expect from the distraction due to the civil war, which gave Eastern people something else to think of than of California. The society received four or five thousand dollars a year for premiums, except in two years. In 1861 it lost all its books, manuscripts, etc., through a flood which submerged the first floor of the pavilion. During the first part of the decade it accumulated a debt of nearly twenty thousand dollars, which it cleared away before 1869.

Supremacy of the Horse Race.—During the third decade considerable improvements were made in the pavilion and the stock grounds and debt was again incurred. The impression began widely to prevail that too much attention was being paid to speed of horses and to the games of chance attendant upon it. Other games of chance also seemed to have sway and gambling of all kinds were almost riotously indulged in during the fair. When shell-games beset their pathways and roulette wheels were running under the grand stand and when "260 stables were built for horses and 191 for cattle on the grounds," the farmers held that the fairs were agricultural only in name. This attitude maintained for several years led to the reduction of appropriations by the legislature, to the reduction of state printing to little more than statement of premiums awarded and to unpopularity with all but the sporting classes and those who were directly interested in bringing people together to get trade from them. It was truly stated that no state money was expended for horse racing; that, in fact, the income from racing helped to pay for the rest of the shows, but this did not satisfy the complainants and it was satisfactory to them that the new constitution of 1879 forbade the expenditure of any state money except by authorized state officers—thus apparently cutting off supplies from the State Agricultural Society because it had private memberships and election of its own officers.

The State Board of Agriculture.—Although the laws, from 1854 onward, speak of the officers of the State Agricultural Society as a "Board of Agriculture," there was really no "State Board of Agriculture" until such a body was created by the act of 1880.

(Continued on page 224.)

P. F. L. E. Shire Mare Winners, Owned and Exhibited at State Fair by Black Hawk Stock Ranch. Left to Right: Flawford Daisy, Horton Felicity, Horton Bounce, Black Hawk Beauty, Black Hawk Cherrie.

ing the scattered pioneers, seeing their work and noting their conclusions concerning the experimental work which they were all doing, and awarding premiums to those who seemed to be reaching significant results. In 1856, seven men reached farms and gardens through the whole country from Chico southward through the Sacramento valley and the valleys around the bay; eastward into the foothills, and southward again to Los Angeles and vicinity. They served without compensation, but were amply sustained by patriotic joy in knowing and making known what Californians could do to demonstrate the capabilities of the State.

Fairs of the Second Decade.—The chief effort of the society in premiums and publications was apparently the promotion of cultures and manufactures to meet California's needs and to establish expert trade. The fairs were regularly held and were usually creditable notwithstanding the fact, as noted, that permanent establishment in Sacramento led to the holding of district and county fairs, "not as aids to the State, society, but as rivals to it." But promotion of cultures seemed the chief line of effort, which it was hoped would not only serve well the State

Agricultural Society to undertake. Premiums of \$114,400 were offered for specified commercial quantities of agricultural and mechanical productions. Some of the former were as follows: For cotton plantations and products \$15,500; for hemp and flax \$7,200; for sugar and molasses \$3,700; for tobacco \$3,600; for rice \$4,700; for hops \$2,200; for tea and coffee \$12,000; for silk \$2,000; for linseed and cotton and oil \$2,000; for indigo \$1,000. The balance of large sum first mentioned, was offered in similar large lumps for manufactures of linen, cotton and woolen fabrics, carpets, blankets, knit goods, forest products, shoes, etc., etc., . The bounty offer attracted wide attention. Payments to the amount of \$12,950 were made after the fairs of 1863 and 1864. Of this total, \$4,000 were paid for cotton growing, \$300 for tobacco, \$250 for hops, \$1,000 for tar, rosin and turpentine and about \$7,000 for manufactures having no agricultural basis. From 1865 to 1868 attention was prominently called to these great state premiums with the announcement in 1868 that fractional amounts of the money would be given for fractional parts of the quantities specified and that the awards would be doubled or

What You Will See at the State Fair.

The best State Fair ever held will delight you September 2-9. Several new buildings are completed, and about \$7,000 more offered in premiums than in 1914 when they totaled \$37,712. Over 100,000 people attended in 1914, the last State Fair.

[Written for Pacific Rural Press.]

All hail yourselves, to the State Fair and make a joyful noise! If you haven't had a vacation, take it here with the boys—and girls—and mothers—and babies. The week will be so full of events that you will have to watch or you will lose sight of the grand chance to get acquainted with the state's leading livestock breeders and to see their best stock with just a little walking around. Don't fail to see also the County, State, and University agricultural exhibits, and the tractors and machinery, also the poultry in its enlarged quarters. Livestock and poultry are discussed more fully in their departments of this issue. Treat yourselves to the sight of a horse race, too. It won't cost you anything extra. In many respects, the 1916

clean as a creamery. A cross-aisle, cutting the center of all the hog sheds, leads to an informal judging ring provided with seats for spectators.

It is to be a lively fair from the standpoint of events, too. Among other meetings will be that of the Western American Berkshire Congress, who will also hold a sale. Rucker & Coppin will hold a sale of Durocs, and Walter H. Dupee will sell some of his Guernseys at auction. State Fair sales have heretofore proved good places to get good stock cheap. The opening day will witness the dedication of the new Women's Building with the Governor speaking. Monday is Labor Day and Tractor Demonstration day. Saturday is Admission Day. All

cents. Family tickets for the entire Fair can be obtained for \$5. There will be side shows, merry-go-rounds, and restaurants on the grounds, and be sure to use the new Women's Building. McKinley Park and five acres of extra space will be available for parking automobiles, free under the eyes of an official attendant.

Machinery and Tractors.—Tractor interest is greatly awakened. At least seven manufacturers will have machines there, and the tractor demonstrations will draw great crowds. Interest among machinery exhibitors seems low. One pump company asked an engine company for use of an engine to run its pump through the Fair, but nothing doing. There are no premiums for machinery because it is unsatisfactory to judge. Part of machinery hall will be taken up by exhibits of automobile accessories.

However, the following people will have all the space they need and will make a show worth going a long way to see if you are going to be interested in their products:

ramento; Miller-Coffing Co.; Studebaker Co.; J. E. White; J. D. Lauppe; Arnold Bros.; Cuyler Lee; Peterson; Sellenger, Sacramento; Skinner & Elliott, Stockton; and Don Lee, California.

They will show not only models of their cars and chassis, but also the latest accessories such as oil, vaporizers, springs, headlight dimmers, etc., etc.

WHO WAS THE FOOL?

[Written for Pacific Rural Press.]

We recently met a man who has been weighing and testing his milk for a number of years. Also he has been using purebred bulls. At first, he says, he was the laughing stock of the community. Other dairymen called him a fool for paying a hundred dollars for a bull when they could get bull calves from their neighbors at veal prices.

As the years went by, our friend with the registered bulls kept increasing his average net income per cow. But nobody knew this because

Manufacturers, Horticultural, and Machinery Buildings, California State Fair. New Women's Building Just Beyond the Manufacturers at the Left. Livestock Both at Right and Left of Horticultural Building with a Great Distance Between.

State Fair at Sacramento, September 2-9, will be the greatest ever. In many classes all space had been allotted before mid-August and late applications were causing much extra activity on the part of the management. Most if not practically all of the exhibitors who are named in other columns of this issue, have the added advantage of having seen or exhibited at the Panama-Pacific last year. Dairy cattle, horses, hogs, and poultry will be especially strong. The hog capacity has been nearly doubled by construction of six new sheds, each as long as the old ones and covering two lines of pens. The poultry capacity has been about doubled by an addition to the poultry building, surrounding an open court. The new women's building, of plain architecture outside, is fitted with all the conveniences to make tired sight-seers comfortable; and a nursery will be provided so mothers may leave their children safely under official care.

All the old buildings have been most thoroughly cleaned, and those not painted are whitewashed outside. The insides of the stock sheds and barns have also been whitewashed, even the floors, so that the cattle sheds and hog pens smell sweet and

through the Fair Joe Boquel will fly every afternoon and evening, looping the loop within the loop in afternoons and carrying fireworks in the evenings. A head-on collision of two 50-ton steam locomotives will give a thrill on one day. At the last Fair the receipts on the day of the collision were $2\frac{1}{2}$ times any other day and amounted to \$17,000. There will be horse races as usual.

For accommodation of visitors a man will be placed at each railway station to direct them to the Chamber of Commerce, where a register of available rooms and prices will be kept for free and ready reference. Large signs over the highways will direct automobilists and others. The Accommodation Committee of the Chamber of Commerce is using its influence as well as the advertising value of their register to prevent any hotels, restaurants, or rooming houses charging more than usual. There are many places in Sacramento where clean rooms and good beds can be obtained for 50 cents and good meals at 25 cents.

All railroads and steamboats give reduced rates to Sacramento. Transportation from the city to Fair Grounds will cost 5 cents and entrance for all over 15 years old, 50

Bean Spray Pump Co., San Jose; Baker & Hamilton, San Francisco; Byron Jackson Pump Co., Berkeley; T. G. Schmeiser, Davis; Victory Motor Co., Niles; Yuba Construction Co., Marysville; Harris Mfg. Co., Stockton; Edw. P. Bacon Co., San Francisco, Cal.; Junior Monarch Hay Press Co., San Leandro; A. L. Young Machinery Co., San Francisco, Cal.; Samson Iron Works, Stockton; and several makers of dairy supplies whose names will be found in the article on Livestock at the State Fair.

A miniature rice mill will be shown.

Exhibitors of tractors were named at length in last week's issue. They are, up to this writing, as follows:

Yuba Construction Co., San Francisco; Holt Mfg. Co., Stockton; Samson Iron Works, Stockton; Dauch Mfg. Co., Los Angeles; Best Gas Traction Co., San Leandro; Bates Steel Mule Co., Los Angeles; and Hughson & Merton with the Big Bulls.

Automobiles.—A feature is to be made of the automobile and motor truck show, the people named below having entered up to date:

J. F. Pieper Co.; Lincoln Highway Garage; Graham & Lamus Co., Sac-

ramento; Miller-Coffing Co.; Studebaker Co.; J. E. White; J. D. Lauppe; Arnold Bros.; Cuyler Lee; Peterson; Sellenger, Sacramento; Skinner & Elliott, Stockton; and Don Lee, California.

They will show not only models of their cars and chassis, but also the latest accessories such as oil, vaporizers, springs, headlight dimmers, etc., etc.

Not a few of them have got to the point where they buy registered bulls; and strange enough, they buy them of that crazy neighbor of theirs who has been adding a few registered cows to his herd from time to time. Needless to say he is considered a good business man now, but what a difference a few years have made!

Spanish Grapes and Almonds.

[Written for Pacific Rural Press.]

As one of our greatest nut and fruit competitors is Spain, a few notes from consular and other reports will help forecast and interpret our own market.

Grapes.—The Malaga district produced about 22,000,000 pounds of raisins in 1915. All of their 1914 holdover and about 19,800,000 pounds of the 1915 crop had been disposed of by Jan. 31, 1916. Growers received high prices, partly due to non-exportation of Turkish raisins and partial loss of the Denia crop. Of the Denias, U. S. received only 788 cases of 110 pounds each last season as against 2,041 in 1914-15 and 8456 in 1913-14. The British embargo will make them seek another outlet this season. The British Isles took 96,000 cases last year.

Almeria exports most of her grapes fresh, and these compete with our Emperors. Last year the growers had a short crop because

they had no money with which to buy fertilizers and spray materials. This year they are taking better care of vines and crops due to high prices received last year. United States took 327,402 barrels of 45 to 50 pounds net last year, which was about half of our imports from Almeria in each of the two preceding years.

Almonds.—In 1915, U. S. imported 8,782,784 pounds of shelled and unshelled almonds from Spain, 6,549,132 pounds from Italy, and 1,239,678 from France.

Our own crop was estimated at 7,600,000 pounds. The consular report has it that at the beginning of 1916 Spanish Jordans were almost exhausted, but supplies of medium and large almonds still remained in the hands of speculators.

As previously reported in our market columns, the Spanish Tarragonas are nearly a normal crop.

What Should He Have Done?

[Written for Pacific Rural Press.]

We found John Soto, one of the fresh-fruit inspectors at Newcastle, on his knees surrounded by half a dozen half-unpacked crates of plums from a wagonload just brought to one house.

The law specifies that fruit in the common "grape baskets" having sloping sides (almost all plums are packed in them) "shall not vary more than 10 per cent in size, and no layer below the top layer shall contain a greater numerical count than the top layer." These baskets are packed four per crate.

All of the half-unpacked crates around Mr. Soto had been packed beautifully though not very tight, with 4 plums square on the top layer of each basket, and the crates marked 4x4 pack. Mr. Soto repacked one, to show that they should have been a certain kind of 4x5 pack which brings slightly lower prices. The middle layers were all of a loose 4x5 pack that should have been 5x5, and the bottom layers were all of smaller misshapen unevenly sized green plums just rolled in. Some of the plums were much riper than others, some were badly cracked and even oozing juice, some had big scabbed-over depressions. Mr. Soto was in a quandary.

"This man's wife used to pack his fruit; and she put up a good reliable pack. She is sick now, and in a hospital. The poor fellow is out there alone, trying to do the ranch work and housework; and he hasn't enough money to get along on. Hold one crate to show him and call me

when he comes in, this afternoon. Mark the rest '4x5' and let them go this time. Plums must go forward without delay or they are likely to spoil before they can be sold. I hate to be hard on a man. But he will have to come up to the mark after this."

MUST REDLANDS CITRUS GROWERS FIGHT FROST?

[Written for Pacific Rural Press.]

We printed a picture Mar. 18, of the snow-capped mountains around Redlands and Highlands. The legend suggested that "the cold air currents from these mountains make frost fighting preparedness a good investment." R. O. Bonnell of the Redlands Chamber of Commerce writes that this is all wrong; that these districts, being close to the mountains are freer from frost than other citrus districts; that "not more than 1 per cent of the groves in Redlands have smudge pots"; that in the past four years "we have had but four days which were cold enough to make frost fighting worth while"; that two of these were during the freak freeze of 1913; that even this did not hurt the trees materially in this district, though even "those who had smudge pots did not save their fruit. This year found the temperature down to 27 once but then only for a short time"; and that frost fighting preparedness does not pay in the Redlands-Highlands district.

We are glad to correct the possible impression that Redlands is worse endangered by frost than other districts and to give her credit for being relatively safe.

But we do not agree with his conclusions regarding the desirability of unpreparedness. In many districts which may have been colder than Redlands in 1913, even lemon fruits were saved by frost pots, so if the Redlands growers with pots did not save their fruit it must have been due to poor manipulation. How many frost pots and years of their maintenance could be balanced against the loss of that one crop in

Engineering the Telephone

THE great Bell System, with its telephone highways connecting the farthest points of the country, is primarily a brain creation.

The telephone engineer is the genius of communication. Like the general of an army, he plans, projects, and directs his campaigns far ahead. He deals with the seemingly impossible—transforming ideas and ideals into concrete facts.

His problems may involve doubling the capacity of a city's underground telephone system, or the building of a transcontinental line, or a serious war-shortage of supplies needed in telephone work.

Whatever the difficulties, they must be overcome so that the progress of the telephone shall continue equal to the ever-growing needs of the people.

It is not enough to provide only for the present—the future must be anticipated and discounted.

In the Bell System, more than two thousand highly efficient engineers and scientists are constantly working on the complex problems of the telephone business.

As a result, the service keeps step with present requirements and the assurance is given to every subscriber that the Bell System is prepared for whatever the future develops.

1913—to say nothing of the fruit-wood-bearing branches that were killed?

The temperatures and damage admitted in Mr. Bonnell's protest are rare to be sure, but they show the chance that at any time the damage may far overbalance the cost of maintaining frost protection. His figures, too, are from government records taken at less frosty points than many of the orange orchards. Even these show lowest monthly temperatures of 30 or below, 12 times in the years 1908 to 1914 inclusive. So we still believe that those Redlands growers who have used frost-fighting equipment consistently are ahead of the game even if they don't need it as much as some other districts.

NORTHERN AVOCADO VARIETIES.

[By C. R. Benedict, Marysville.]

Butte county has the most northerly semi-tropical nurseries and gardens in this country, if not in the world. These are the Butte County Foothill Nurseries and Gardens, located at Sunny Slope, in the already famous orange and olive section,—the warm foothill belt of southeastern Butte county.

And it is now an accepted fact that the avocado will not only grow in Butte county's northern latitude, but that it will thrive and produce there: that it will thrive under the same conditions as the orange; that it will both live and bear fruit longer; that it will grow faster; that it will stand even a greater degree of cold than will a citrus tree of the same age; that it requires less attention than a citrus tree, and is so far practically free from pests.

Among the ahuate varieties found, by the Butte County Foothill Nurseries, to be so far well adapted to conditions in northern and central California, are the "Harmon," originally imported from South America,—a very early producer of thin-skinned oval fruit, free from "rag" or fibre, and of a very rich, oily flavor; the "Northrup," a thin-skinned variety from Mexico, hardy and vigorous and fine for a home garden, being especially valued for its lack of fibre and its rich flavor, and yielding a crop both spring and fall. The "Chappelow" is one of the early varieties in California. Like the Northrup, the Chappelow is also a Mexican type, the parent tree at Monrovia having been sent the Department about 1896 from some high and frosty elevation in northern Mexico. Its slender, long-necked fruit is very attractive, being dark purple in color, and of exceptionally fine flavor.

GRAPES DIDN'T SET.

To the Editor: We have Thompson Seedless grapes planted on sandy soil. They are thrifty and six years old but bear no grapes.—Sub., Martinez.

[A reduced sap flow at blooming season is necessary to set grapes. Delay the plowing until blooming time; then plow deep to cut surface roots and reduce sap flow. By the time new rootlets have formed, the fruit will be set, and ready to use the sap they send. Avoid all irrigation until June at the earliest; then if

you have water, give it to develop berries and support the leaves so there will be no sunburn. This is recommended by Frank Henry of Fresno and practiced by A. B. Cate and Chas. Westrup of Clovis; W. W. Phillips and J. W. Dawson of Fresno; J. A. Schlueter, F. H. Booth, B. H. Fisher, W. H. Wilson, and C. K. Hays of Kerman; S. G. Wilkinson, Peterson Bros., De Lano Bros., and J. Zalian of Sanger; and O. D. Smith of Monmouth.

The Nutrition Laboratory of the University of California has recently analyzed a number of grain sorghums, including kaoliangs, white, brown and buff durras, and feterita. The average of these, so far as chemical analyses indicate, is a close agreement with that of Indian corn. When the price of grain sorghums is considerably below that of Indian corn, it is advisable for the feeder to use them, particularly for poultry.

10,850 MILES WITHOUT STOPPING THE MOTOR KING EIGHT CYLINDER

A registered STOCK car (everything stock—gear ratio, ignition, tires, wheels, etc.) made this unparalleled record in a Car Owners' Service Test conducted under OFFICIAL A. A. A. sanction and supervision.

Sheepshead Bay Speedway and Long Island, New York roads were the scenes of this sensational trial which began at 12:14 P. M. June 15th and finished at 12:14 P. M. June 29th. Officials of the American Automobile Association maintained a daily 24 hour vigil during the entire two weeks. Many newspaper and motor journal representatives and parts manufacturers were in constant attendance.

The sturdy KING ran day and night through rain, fog and boiling sun without requiring a single replacement or adjustment.

10,850 miles equals about two years' travel in the hands of the average owner, yet in this entire mileage the car was stopped (with the motor running) for a total of but 15 hours, 25 min. 41 sec. On this basis the test demonstrated that a KING EIGHT, even with the motor running continuously for two years, requires only *nine minutes per week* of an owner's attention for *all* service—gasoline, water and oil fillings, tire changes, battery care, etc.

And most astounding of all, the KING made this 10,850 miles with a total labor expense of considerably less than *ten dollars*.

During the entire 10,850 miles a weight equal to five passengers was carried and the car maintained an average speed of 34 miles per hour, excluding stops.

An examination made after the test proved the car to be in perfect running condition and ready for another trial of the same or greater length.

This great KING achievement tops off the series of remarkable road tests recently conducted on the Pacific and Atlantic seaboard. Climbing tortuous Mt. Wilson in Southern California sealed in high gear; traveling 987 miles in high gear from Los Angeles to San Francisco and return, and driving 544 miles in high gear from Providence to Providence via Albany and New York City, are three remarkable accomplishments of the eight cylinder KING all within a fortnight.

The accuracy of every statement in this advertisement can be proved by impartial, official documents. These gruelling trials have raised still higher the proud estate of KING ownership, and to prospective car purchasers this pioneer eight cylinder car now offers a record which can mean nothing less than ABSOLUTE SATISFACTION IN PERFORMANCE, SERVICE and OPERATION ECONOMY.

Available Nitrogen---400 Lbs. for \$6.

[By C. A. Beinhorn, Field Manager for Balaam & Beinhorn, Naranja.]

On Sept. 15, 1915, I commenced planting cover crop in the Balaam and Beinhorn orchard, broadcasting 18 pounds of melilotus seed and five pounds of bur clover seed to the acre, inoculated with "Westrobac." The planting took about 11 days. The ground had been irrigated and cultivated just afterward, to a depth of about two inches. In ten weeks from the time the seed appeared in plant form above the soil, some of this clover had grown to be 31 inches high. In the latter part of February, I dug up several root systems of the melilotus clover and carefully washed the earth away from the nodules on the roots. Some counts went as low as 52 nodules to the root, while the highest went 182 nodules to the root. These nodules to the naked eye would seem to be about three times as large as the seed of a bur clover plant, while some were as large as a vetch seed, and very reddish brown in color.

Nitrogen Figured.—The weight of each nodule would be about the same as that of an individual seed, and as the average number of nodules to each root was 117, it would appear that the weight of the nodules collectively would be 117 times the weight of the seed that actually sprouted and grew. In view of the fact 5 pounds of bur clover seed was planted, on which I did not take the count, I will estimate that 12 pounds of the melilotus clover seed grew. As the nodules appeared to be 117 times as heavy as the seeds, 12x117, or 1404 pounds of nodules to the acre. If 20 per cent of this were

available nitrogen, we would have 20x1404, or 280 pounds of available nitrogen to the acre from these nodules alone, from the melilotus clover, not counting the bur clover.

Again: the melilotus and bur clover, if it had been cut in hay form, was estimated by three men, one of whom is a professor of agriculture at Riverside, to run three tons of hay to the acre. Prof. Vaile of the Riverside Experiment Station estimates that 2 per cent of the net weight of this clover top is available nitrogen. Thus we would have .02x6000 pounds, or 120 pounds of nitrogen from this source, making a total of 400 pounds of available nitrogen per acre from this cover crop. In addition to this, we have the full benefit of all this cover crop foliage, in the form of mulch. This is absolutely essential for good cultivation and proper irrigation.

In order to obtain nitrogen from sulphates of ammonia to the same extent as from the melilotus cover crop, it would cost at least \$45 per acre, not including the cost of application. The entire cost of the melilotus crop runs about \$6 per acre, figured as follows: Westrobac, per acre, \$2; seed, 18 pounds at 7 cents, \$1.26; bur clover, 5 pounds at 10 cents, 50c; preparing seed and sowing, \$1.25; extra harrowing, \$1.00.

I will say that a cover crop of this nature adds greatly to the moisture-retaining properties of the soil, and I will be glad to give the results of my experience on this point next November.

GROW SEED POTATOES.

[Written for Pacific Rural Press by T. O. Morrison, Washington State Division of Horticulture.]

Replying to your letter of August 5, I am of the opinion that the value of seed depends more upon the care exercised in growing and selection of the strain than the locality where it is grown. We may soon realize that careful selection and proper storage will be more important than the exchanging of seed from one district to another. This, however, is a point on which many growers as well as potato specialists do not agree. I am just in receipt of a report from one of our field men saying:

"The majority of the potato men in this locality are either beginning to or will soon use outside seed. Most of the Minnesota seed shows 20 to 100 per cent better yield than seed grown at home."

In other instances, the reverse is true; and I believe one reason for the poor results from so much of the home-grown seed is that it was not really grown for a seed crop and consequently received little of the attention that should be given the crop when grown for seed purposes. The growers in this State are just beginning to wake up to the necessity and actual importance of clean seed of strong vitality.

In order to encourage and demonstrate the practical value of seed potato selection we are co-operating with two large growers in the vicinity of Outlook, Wash., hoping that we may be able to assist them in

producing at least a very nearly clean crop that would be desirable for seed purposes. If the results are satisfactory, I believe a number of other growers will try to duplicate it next year.

FALL ALFALFA SEEDING.

[Written for Pacific Rural Press.]

While there is much difference in opinion as to the best time of year to plant alfalfa, F. Stenzel, a large Holstein breeder of Alameda county, has had best results on heavy black soil in the late fall and early winter.

The right time to plant alfalfa, according to Mr. Stenzel, is when the soil can be gotten into a fine seed-bed condition. That is, he has no special calendar date but waits till the ground is in as good condition as would be required for good germination of garden seed.

When planted at such times he has never failed to get a good stand, regardless of later frosts, but he has found that under his conditions he gets a better stand and more vigorous plants if the ground is summer fallowed the season previous to seeding.

BEARDLESS BARLEY.

To the Editor: Is there a beardless barley, and where can I get some?—M. T., Moraga.

[Answered by John Cook of Moore Ferguson Co.]

[Beardless barley is grown in a limited way throughout the State, and is used chiefly for hay seed. At present none is available but likely will be later in the season, after harvest.]

Firestone Non-Skid Tires

—Built for the man who must make town for market, bank or train.

—Built for the man who must have tires that will give him service, regardless of weather or road.

—Built by the men who are specialists in making and selling tires—men who do nothing else in America's Largest Exclusive Tire Plant.

The sturdy Firestone qualities of sure grip, long life, great resiliency, and freedom from mishaps have gained the patronage of motorists everywhere.

"DATE GROWING

In the

NEW AND OLD WORLDS."

BY PAUL B. POPENOE.

The author has studied the DATE GROWING INDUSTRY where it has flourished forty centuries—in Northern Africa and Arabia—under the auspices of the United States Department of Agriculture. He has also studied it in California and Arizona, and shows there are sections in these States where certain varieties of dates may be much more commercially grown than now and with great profit.

Seed Potatoes for Southern California.

[Written for Pacific Rural Press.]

The idea of growing strictly high grade potatoes in Southern California solely for seed is enthusing E. D. McSweeney, of El Monte, Los Angeles county, who has grown two crops a year several seasons with great success on 30 to 50 acres.

The trouble of getting well selected seed with well selected ancestors, gave him the idea, and he hopes to find a grower of such, in a different climate from his own, with whom he can exchange seed potatoes. He believes, in common with many others, that seed potatoes should be planted in a different climate from where they were grown.

Fall Crop.—Early this August, Mr. McSweeney was planting his "fall crop" of White Rose, which is the only variety grown. He would plant 100 acres if pedigreed seed could be obtained. He rents run-down alfalfa for potatoes, and does not like to raise two crops in succession on the same ground, but likes at least two crops of potatoes from each field. To work this, he follows potatoes with beans or other cultivated crops and follows them with potatoes. The yield this spring was 5500 sacks or 110 sacks per acre.

For the fall crop, Mr. McSweeney picks the best potatoes of the spring crop for seed. It is better for them to be dug a month or so before planting, to season up; but many plant them at once. Mr. McSweeney held them two weeks before planting, this summer. They are dipped in corrosive sublimate to kill scab, regardless of cost. He cuts two eyes per piece, emphasizing the need of "plenty of meat" to sustain the sprouts until they get some growth above ground. The seed end is thrown away because it produces too many sprouts for the small amount of "meat" on it.

The ground is checked and flooded, then plowed as soon as possible, and planted. Many do not irrigate again until the potatoes are up, but Mr. McSweeney saturates the ground about two weeks after planting.

The rows are ridged up by cultivation and irrigated three or four times more. Water is not allowed to cover the ridges because it hardens the ground and spoils the shape of potatoes. They are dug in December; and they keep much better than the spring crop which must be disposed of in a very short period.

Last season Mr. McSweeney sold the fall crop for seed without storage, buyers having come even from Imperial Valley.

The spring crop is planted about Feb. 10. It is seldom irrigated more than once. The ground should be kept from cracking enough to expose tubers, and they should not be exposed out of doors all night, as the greatest pest of potatoes in Los Angeles county is said to be these insects, whose eggs are laid mostly at night and on tubers, and whose larvae burrow all through the potatoes.

The spring crop is harvested in June or July and sold locally, mostly to eat. Many of the southern California potatoes are shipped to Texas and the Southwestern States.

The work of W. V. Shear, inspector under the seed potato certifica-

tion law of 1915, indicated a way of finding the pedigreed seed desired if such is grown in the State.

HYDRATED LIME ALL RIGHT.

To the Editor: You have recommended hydrated lime for ground sweetening, lightening, etc., but I find that it burns tender plants just under the surface of the ground.—Subscriber.

[Answered by Prof. Chas. B. Lipman, University of California.]

[The caustic properties of hy-

drated lime may perhaps be injurious to tender plant tissue, but they certainly are not injurious to the soil. There is some slight evidence that hydrated lime, but more particularly caustic or burnt lime, unslaked, may hasten the decomposition and loss of organic matter from soil. The evidence, however, is not such as would justify a complete condemnation of the use of burnt lime, much less of hydrated lime.

I think, therefore, that you are perfectly safe in going ahead with the recommendation for the use of

can be purchased very cheaply and where heavy soils are to be lightened. In the case of other soils and other circumstances, I see no necessity for using anything else than the ground lime.]

AGRICULTURAL NOTES.

Disking before plowing helps prevent turning big clods under.

Select seed potatoes while they are growing.

An eastern farmer pays his son 25 per cent of the net profits.

Do you read our Power on the Farm department?

Twice What You Require in the Hudson Super-Six

Records Prove Power and Endurance

What Power is Wanted?

THE HUDSON SUPER-SIX is a light car, as a modern fine car must be. In ordinary driving, 40 horsepower would be ample. That's what motors of this size heretofore developed.

But the Super-Six—our patented motor—delivers 76 h. p. Yet we add no size, no cylinders. We don't increase fuel consumption. We have simply lessened vibration, reducing friction to almost nil. And we thus save the power that was wasted.

That extra reserve power means much on hills. It means much in flexibility and in quick response. It saves much changing of gears. Would you want an engine of equal size which lacked it?

What Speed is Wanted?

The Super-Six speed records—quoted below—have never been matched by a stock car. You perhaps don't want such speed. We made those records to prove the motor's supremacy. Also to prove its endurance.

But they mean that in ordinary driving you will run the Super-Six at half load. And that means a long-lived motor.

What Endurance is Wanted?

Nobody knows how long a high-grade modern car will last. All we can do is to compare the endurance by extreme and prodigious tests.

A Super-Six stock chassis was driven 1819 miles in 24 hours, at an average speed of 75.8 miles per hour. The same car previously had been driven 2000 miles

at average speed exceeding 80 miles an hour. No other car ever has matched that endurance test. It would take five years of pretty hard driving to equal those top-pace strains.

But this Super-Six motor, after all those tests, showed no appreciable wear whatever. So the Super-Six is likely to last years longer than any man expects.

What Luxury is Wanted?

You find in the Super-Six all the beauty and luxury that we know how to put in a car. You find a luxury of motion—due to lack of vibration—which you never before have experienced.

You will find fine engineering, with all the satisfaction that comes of it. For this is the crowning effort of our great engineering staff, headed by Howard E. Coffin.

You will find pride of ownership which comes from owning a car of the Hudson repute. A car which outrivals other cars in performance. A motor which by every test holds unquestioned supremacy.

Where else can you find what you find in the Super-Six? Or anywhere near what you find here?

You will find fine cars and great cars, according to former standards. But the Super-Six invention has set some new standards. And Hudson controls that by patent.

Think of these things when you buy a new car. Prove up the differences by road comparison. If you are buying a fine car, and buying to keep, you don't want a second-place car.

Some Hudson Records

All made under American Automobile Association supervision by a certified stock car or stock chassis, and excelling all former stock cars in these tests.

100 miles in 80 min., 21.4 sec., averaging 74.67 miles per hour for a 7-passenger touring car with driver and passenger.

Layne & Bowler PUMP

The Layne & Bowler Pump possesses a much wider range of capacity than other types of pumps. The most competent and well known engineers and large irrigators throughout the United States highly endorse the Layne & Bowler Pump for it represents the highest development of water-raising machinery in the world today.

Over 5000 Layne & Bowler Pumps in successful operation testify to their wonderful merits.

This type of pump has been recognized by pumping authorities as the type of simplicity combined fording the greatest with the least investment for a given pumping capacity.

Our New Catalog No. 25 is fully illustrated and gives detailed information concerning this great pump. Write for it at once.

LAYNE & BOWLER CORPORATION

General Agricultural Review.

CITRUS, NUTS, OLIVES.

Permission has been granted for California to ship oranges to England on English vessels.

San Dimas lemons shipped the three weeks preceding Aug. 14 are reported to have sold at \$158,000 f. o. b.

The Durham almond crop is estimated at 70 tons. Last year it was 450 tons. Smudging is in the minds of growers.

A Corning olive grower has thinned his Queen Olives and on that basis has sold them at \$225 per ton on a five-year contract with the Maywood Packing Co.

J. B. Wrantham of the California Almond Growers has been selected by Market Director Weinstock as the State's representative on the Board of Directors of the California Associated Olive Growers. They hope to handle this season's crop.

Plano citrus growers recently organized the Sunland Packing House Co. and affiliated with the Tulare County Citrus Fruit Exchange which markets through the California Fruit Growers' Exchange.

Dean H. J. Webber of the Riverside Experiment Station has recently visited the canker-infected Texan citrus districts, and returns with fresh warnings to watch for it and stamp it out at every appearance.

Spain exported to the United States in 1914, \$1,443,376 worth of olives, \$84,453 raisins, \$541,553 almonds, and \$342,584 olive oil, according to the government daily consular reports. The United States is the largest buyer of Spanish olives and olive oil.

Excavation for the administration building of the new Citrus Experiment Station, Riverside, is about complete and construction will soon proceed. Irrigation pipe has been delivered, a deep well recently completed and a big irrigation reservoir dug.

Final settlement by the Cal. Walnut Growers' Ass'n Aug. 14 for the 1915 Santa Ana Valley walnut crop shows that 85 cents per hundred pounds covered all expenses of marketing, running packing houses, insurance, brokerage, etc.; \$358,608 were distributed to growers.

GRAPES.

Fifteen cars of Tokays were shipped from Lodi Aug. 17.

Practically all of the 1915 raisin crop has been sold. Raisin sales for July exceeded those of a year ago by 1800 tons.

Colusa Sultana and Thompson growers started picking for raisins last week. Some crops promise 1½ to 2 tons per acre. There are about 800 acres around College City.

MISCELLANEOUS.

One-fifth more freshmen applied for admission to the State University than ever before.

Hilgard Hall, a \$350,000 University Building, has been begun at Berkeley for the College of Agriculture.

Stormy weather for three days was succeeded by frost in Western Nevada on the night of Aug. 18. Little damage was done to crops.

The Napa county Mt. George Farm Center is to hold formal dedication exercises for its commodious new hall at 2 p. m., Sept. 3. Attractive invitations are being sent out.

Terra Bella farmers voted Aug. 12 to issue \$1,000,000 bonds for an irrigation system. Part of the proposed area is already planted to citrus and olives under pump irrigation.

Secretary Nell G. Thayer of the Mariposa County Farm Club writes: "The Fourth and Fifth Supervisor Districts of Mariposa county will hold annual fair at Jerseydale fairgrounds Sept. 8, 9 and 10. Dean Thomas F. Hunt will conduct a Farmers' Institute in connection with the fair on the 9th. The grounds are beautiful for camping. Bring blankets; can buy 'eats' on the grounds. Mariposa county has a Farm Club that is not a Farm Bureau. We meet the second Saturday of each month at Chowchilla school house. On Sept. 9th we hold our meeting and Farmers' Institute at Jerseydale Fair Grounds. The club considers this a fitting celebration of Admission Day.

GRAINS AND FIELD CROPS.

Several Arbuckle farmers are raising alfalfa seed.

Lima bean harvest will begin at Oxnard about Sept. 1.

The Butte County Rice Mill at Biggs is near completion.

A Butte county barley grower has sold 22,000 sacks at \$1.42½.

The Oakdale Milling Co. is to put up a new warehouse for this season's rice.

Two Salinas Valley potato fields are on the way to produce certified seed potatoes.

Hop crop promises 110,000 to 115,000 bales, but there is very little buying or selling.

The Goleta Lima Bean Growers' Ass'n has signed up about 18,000 sacks of this year's crop.

Lima bean prices are to be set by the new association at their Oxnard meeting early in September.

A car of 270 bags of potatoes was condemned at Klamath Falls, Ore., for containing tuber moths which had escaped notice of California inspectors.

RACINE HORSE SHOE TIRE

THE LUCKY TIRE

GUARANTEED
5000 MILES

Keep your car well shod by traveling on the Racine Horse Shoe Tire. Test this tire out and see for yourself how superior it is to all other inexpensive tires.

The Racine Horse Shoe Tire is manufactured by the Racine Auto Tire Company, one of the oldest and most reliable concerns of its kind in the country. This concern has developed what we positively believe to be the foremost tire in America, considering price.

Be sure you get the tire with the Horse Shoe (Lucky) tread. It's a winner.

Ask for Price List, Folder, and Name of Dealer in your vicinity who handles the Racine Horse Shoe.

CHAS. W. PAINE, Secretary.

JOHN M. PERRY, President.

To. Aug. 14, Turlock shipped 2312 cars of watermelons and cantaloupes. Shipments are fast decreasing.

Forty cars of green tomatoes were shipped from Marysville to Northwestern and Eastern States this season.

Livingston expects to ship 15,000 sacks of grain. One grower substituted beans and corn on 3000 acres of grain land.

Miller and Lux have leased 10,000 acres of Kern county land to representatives of Belgian and Japanese beet growers.

Four-year contracts were signed for nearly 1800 acres of sugar beets around Fallon, Nev., where 4000 acres had been set by the Sugar Co. as a minimum.

Four hundred sacks of onions per acre were reported from San Joaquin county last spring from land which was to grow pink beans for September harvest this same season.

The American Beet Sugar Co. will run the beets from about 38,000 acres through their factory at Oxnard this year. A large acreage of these are planted in the San Fernando Valley of Los Angeles county. Both the yield and quality are usually good this year.

The continued cool, foggy weather is materially strengthening the prospects for good bean crops in Ventura county as well as in other bean-growing regions along the coast. It is thought that the bean crop in the Santa Barbara district will be a trifle short of last year.

The recently elected directors of the Pacific Rice Growers' Ass'n are to represent districts as follows: Geo. E. Harvey, W. E. Barnard and R. E. Fields, Biggs; C. B. Harris and A. J. Lofgren, Richvale; H. O. Jacobson, Butte City and Chico; C. L. Donohue and Ernest Behr, Willows; W. K. Brown, J. S. Campbell and F. G. Burrows, Yolo; C. M. Farris, Gridley; H. C. Gingg, Marysville; L. J. Lavers and Jno. Irish, Jr., San Joaquin Valley.

DECIDUOUS FRUITS.

The Banning Cannery closed Aug. 17.

Prune price offers are reported to be improving again.

The weekly payroll at the Porterville Cannery is over \$2000.

Placer county canning peach growers now want to ship East.

Colfax fruit shipments are expected to exceed 100 cars, mostly pears.

The California Peach Growers Inc. are reported to be designating regular packing companies' packing houses for receipt of fruit.

The California Fruit Distributors recently reported one day's Eastern auction sales of California grapes at 42 cars bringing about \$60,000.

The Selma warehouse of the California Peach Growers Inc. is to have its machinery installed before the building is completed, so great is the rush of incoming fruit.

The Earl Fruit Co. of Sacramento has contracted a large number of Oregon Italian prunes for shipment East. People back there are sure

hungry for fruit and able to buy it this season.

A merger to include the C. F. C. A., Central California Canneries and others, not including Libby, is being negotiated in San Francisco. Capital is to be \$25,000,000.

Dried peach growers were recently asked to keep their fruit a

week or two because the association didn't have enough warehouse facilities. They hope soon to handle all receipts promptly.

"We are taking steps to form a farm loan association under the National Rural Credits Law," writes E. E. Greenough of the Merced Grange No. 366.

Mechanical Power on the Farm.

HYDRAULIC RAM BALKS.

To the Editor: I have just put in a second-hand hydraulic ram—two-inch drive pipe 32 feet long with 8½ feet fall—¾ inch outlet pipe 350 feet to the tank with a lift of 25 feet. The ram would not work, so I put a weight on top of the plunger pin, and it works all right. Why will it not work without the weight?—H. R. D., Santa Cruz.

[If you had to put a weight on the plunger pin where the waste water runs out of your ram, it would seem to indicate that you were trying to lift the water against too great a friction head. We take it that the outlet remained closed constantly until you put the weight on.

Since the exit of a certain amount of water into the air chamber of the ram depends on a stream flowing out of the waste valve with considerable force before the valve is closed by that same force, it would seem that the weight and friction of water in the pipe above the air chamber was so great that the water running out of the waste valve was not allowed to accumulate enough speed and force before the valve closed, to force any water into the air chamber. The weight you put on holds the valve open until more force has accumulated in the waste stream. The ram would probably work without the weight if your outlet pipe were of larger diameter or shorter, to avoid so much friction.]

ELIMINATING DITCH WATER.

[Written for Pacific Rural Press.]

Ditch water has not proved entirely satisfactory in the Redlands orange district, and many growers

Motor oil made from asphalt-base crude gives best lubrication with least carbon. Such is the testimony of motorists and experts alike. As Lieut. Bryan, U.S. N., puts it: "Oil made from the asphalt-base crudes have shown themselves to be much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils." Zerolene is scientifically refined from selected California crude—asphalt-base—not only made from the right crude but made right. Dealers everywhere and at service stations and agencies of the Standard Oil Company.

ZEROLENE
the Standard Oil for Motor Cars

are putting in pumps and wells. Among these is an association of farmers known as the Mascart Water Co. controlling 110 acres of orchard. They have a 13 h.p. motor which runs a pump and distributes 68 inches of water through the various orchards as agreed upon. The lift is 20 to 35 feet according to rainfall the previous winter, and it costs 79 cents an inch for the water delivered at the outlet pipes. Advantages besides cheapness, are independence, warmer water in spring, use it when you want to, no distant ditches to maintain and no near ones from which water may seep to be lost or to injure nearby trees. Cold mountain water applied to the trees while in bloom shocks them so that they do not set their fruit as well, according to M. C. Mascart.

DECIDE THESE TRACTOR QUESTIONS AT THE STATE FAIR.

1. Is it desirable to work out a system by which all manufacturers so desiring may have their product tested and rated by the Office of Public Roads and Rural Engineering?

2. Should the draw-bar ratings be in terms of horse-power or merely in terms of pull exerted?

(a) In the former case the result will be determined by the following equation:

$$H. P. = \frac{\text{Draft in pounds} \times \text{Distance in feet}}{\text{Time in minutes} \times 33,000}$$

(b) In the latter case the element of time is neglected and an engine of slow speed and a given draw-bar pull would get an equal rating with one of the same draw-bar pull, but possibly twice the speed.

3. Which one of the following methods should be followed in determining the horse-power?

(a) Start the engine and take the horse-power for a short run immediately after the engine is warmed up.

(b) Take the horse-power as above, then operate the tractor continuously for 6 to 8 hours and again take the horse-power at the end of that time.

(c) Take the horse-power continuously for 6 or 8 hours and use the average results.

PUMPS DRAIN IRRIGATION DISTRICT.

[Written for Pacific Rural Press.]

Work is in progress in the district north of Ripon to organize a drainage association to lower the water level. Since the South San Joaquin Irrigation district has been furnishing water, the moisture has risen close to the surface, and in some low spots has formed miniature lakes, causing the loss of parts of fruit orchards. Some pumps have been placed and are now lifting the water into ditches to lower the water table.

Each fruit packer for Jas. Elliot of Courtland puts his letter initial on each box or crate so that improper packs may be traced to the guilty one, and perhaps a better record of the quantity packed by each.

Do you know how much cash your crops cost and returned?

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

LUITWIELER PUMP

HOW CHEAPEST WATER IS PRODUCED.

It costs less to lift and deliver a steady stream of water than a jerky, uneven stream—everyone will agree to that. But the Luitwieler (non-pulsating) pump is the only pump on the market that delivers an absolutely even stream, consuming the least power. That's why it proves the most inexpensive pump on the market. Every Luitwieler owner will confirm our claim. Write at once for our free irrigation booklets that contain valuable and interesting information.

REDWOOD TANKS—SILOS.
Thirty-five years in this business in Stockton.—A 500-gallon tank, \$8.00. A tank 6 ft x 2 1/2 ft., \$7.50. Other tanks equally cheap. I deal direct with the consumer, saving 10% to 25%. All sizes in stock. Clear dry redwood direct from the mill. Write for price today. Best improved machinery. Doors, Windows, frames, Millings.
F. WILSON,
STOCKTON, CAL.

GRADING DRIED PRUNES.

[Written for Pacific Rural Press.]

"Is it worth while to grade your dried prunes before selling them?" we asked F. R. Shafter of San Jose who has a 5 h. p. steam engine to run a grader able to separate 20 tons a day into seven grades. The steam is furnished from a 50 h. p. boiler which runs a big steam engine to pump for irrigation. Besides running the dried prune grader, the little engine has a belt running the other way to run the Anderson-Dargrover grader, which separates prunes into different sizes as they come from the dip, so they will dry more evenly on each tray. The exhaust from the engine opens into the kettle and helps to keep the water boiling. Mr. Shafter dries for many of his neighbors, which might make a difference in the profitability of a dried prune grader.

"I happened to have 17 boxes of prunes here once, and time to look for the answer to your question," said Mr. Shafter. "I tested the lot by weighing a pound and counting the prunes in it as the packers have based their prices. I graded the lot, took out the little ones, and figuring the same basis price, the balance was worth \$2.50 more than the entire original lot had been. That was good pay for the grading, and I had the little ones besides. But the largest six grades in bulk were worth no more than the same prune after grading them. So I now grade only to get out the smallest size. The work is done quickly, so I never grade all day at a time; but it is no trouble to start and stop the engine whenever there is a small lot to be graded."

Publisher's Department

B. F. Stroup, of Anderson, in remitting pay for his subscription, says: "I like your paper very well. I like the cheaper paper better than the glazed." We are very glad to learn that Mr. Stroup likes the new print we are now using, though we fear many others, ourselves among the number, do not. The white paper situation is becoming very acute in the east as well as the west. Many papers have suspended publication, others have cut down in size and some have consolidated.

The Western Empire of Los Angeles points at the head of its columns the statement that it is the only farm paper in the Southwest that belongs to the Audit Bureau of Circulations. As that paper claims to have offices in Los Angeles and San Francisco and as the Rural Press has offices in both these cities, we must demur to the foregoing statement. As far as we know the Rural Press is the only weekly farm journal on this Coast having membership in the A. B. C.

In a letter to us recently, T. S. Glide of Davis, says: "Regarding results received through advertising in your paper, will state they have been more than satisfactory. I have received more inquiries not only from stockmen in this State but other States as well and have made numerous sales through advertising in your valued paper."

A little over two years ago F. O. Popenoe of Altadena issued a 300-page, handsomely gotten up book on Date Growing. The book has met with a flattering reception, and to aid in its sale the Rural Press is to receive a consignment of them this week. The price of the book is \$2 postpaid. Send us your orders.

Two Ears of Corn Where One Grew Before

The farmer who can make two ears of corn or two blades of wheat grow where but one grew before, is well on the way to prosperity for he is solving the problem of intensive farming.

Irrigation with G-E Motors

has made many a dry, unproductive district into profitable farming country—a garden spot of bountiful crops.

This is not empty boasting or mere theory—it is *fact*. Ask anyone who has used G-E motors on his farm—he will tell you that they save money every day in the year. The first cost is low, too. Write our nearest office—it costs nothing to find out and places you under no obligation.

Livestock at the State Fair.

[Written for Pacific Rural Press.]

Do you want to know what you will see at the State Fair? Well, in the livestock line you will see the leading breeders of the State most of whom have some of their best stock for you to see. The rest are there for the same reason you are; to talk with other breeders and compare their stock without traveling all over the State to see it. You will select a few breeders probably, whose herds you will want to see at home.

You will see some animals you will want to improve your herd. If your herd sire has been used to the time limit, the State Fair is the place to get a new and better one, either by outright purchase or by finding other breeders who are in the same situation and will be glad to trade.

The breeding stock you see at the Fair is all certified pure-bred. All competing for premiums must have furnished specific evidence of breeding ability. Many of the animals will have a number of their offspring and relatives to show their performance ability. All animals shown must have a certificate showing them free from infectious or contagious diseases, and transmissible blemishes, signed by the State or the State Fair veterinarian.

You will find them in stalls and barns, freshly, thoroughly cleaned and whitewashed to the roof and floors. Grooms caring for stalls in the best shape will win \$195 in eight prizes. You will enjoy looking at the erstwhile hideous red horse barns which are now cream colored outside and white inside with colored decorations. You will find the dairy barns not far from the dairy machinery, dairy products and cows on the five-day milking contest. Don't fail to see the way they handle the contest.

Entries.—Of the hog breeders, at least 78 have entered 640 head for \$3589 prizes, four champion gold medals for each breed and 500 pounds Economy Stock Powder. These include Berkshires, Durocs, Poland Chinas, Yorkshires, Tamworths, Hampshires, and others. Three hundred new pens have been furnished for them.

Of dairy cattle breeders, 36 have entered 303 Holsteins, Jerseys, Guernseys, Ayrshires, Dutch Belted, and Dairy Shorthorns for \$5382, besides an Ayrshire cup and \$330 for a 5-day milking contest for fat production and \$150 to grade cows with Testing Association records for fat production. Only three cows are entered in the 5-day contest so far as the State Fair people informed us, but entries do not close until September 1, and there is likely to be interesting competition.

Of draft horse breeders, 20 have entered 145 Percherons, Belgians, Clydesdales, Shires, Jack stock, and grades for \$4089 cash, 8 gold medals, 8 trophies, 28 silver and bronze medals, and some ribbons.

Jacks and Jennets are entered by three breeders, 11 being shown for the \$316 prize money and two gold medals.

Coach and saddle horses and ponies will be interesting to everybody, for these animals touch the admiration of the greatest and least of us.

There will be a small show of Thoroughbreds which have been left out several years; and of Arabians which have never before been classified.

Beef Cattle of the Shorthorn, Hereford, Red Polled, and Aberdeen Angus breeds are entered. There are 54 Shorthorns, 7 Herefords, 15 Red Polled, 2 Angus and one grade. The University Farm shows all but the Shorthorns and Red Polled.

Sheep are represented by Rambouillet, Shropshire, Hampshire, Southdown, and Oxford breeds to the number of 76 exhibited by 8 breeders, 78 range sheep by three breeders and 4 fat sheep by one.

Five goats are entered by University Farm.

Dairy Machinery.—A model working creamery will be making butter at the Fair and separators, Babcock testers, pasteurizers, milk coolers, etc., will be shown by Sharples Separator Co., San Francisco; Daniels & Son, Berkeley; Empire Separator Co., Sacramento; De Laval Dairy Machinery Co., San Francisco and Santa Fe Lumber Co., San Francisco.

Events.—Watch the stock judging in every class you care about, and listen to what the judges say afterwards. Ask them why they placed the animals as they did, to help you in selecting suitable stock for breeding, or showing at future fairs.

Two stock parades will include all stock exhibited. Premiums will not be paid unless the stock is paraded. Winning horses will be shown also at the Night Horse Show.

There will be a livestock judging contest for farmers' boys under 21, beginning at 8 a. m., September 4. The prizes will be five scholarships at University Farm. Three dairy products scoring prizes will also apply on \$150 worth of University Farm scholarships.

Several livestock sales will take place as advertised.

It is reported that there will be a sheepmen's meeting and a Holstein breeders' meeting besides the Western American Berkshire Congress.

The Duroc Jersey and Poland China futurity contests are bringing out at least 20 entries each or they will not run.

Boys' pig club pigs will compete for \$60 in six prizes, and the winner of first prizes will receive a purebred pig valued at \$50 from Murphy Bros., Perkins.

Swine: Berkshires.—Oak Grove Dairy Farm, Woodland, 8 head; D. D. Warnock, Dayton, 14; G. E. Metcalf, 5; F. R. Steel, Grants Pass, Ore., 10; A. L. Stephenson, Los Molinos, 1; Perkins and Co., Perkins, 1; A. B. Humphrey, Escalon, 16; W. M. Carruthers, Mayfield, 16; R. C. Hannan, Corning, 5; Arlington M. Smith, 1; G. A. Murphy, Perkins, 8; H. L. and E. H. Murphy, Perkins, 13; Markhofer and Latta, 11; J. T. Peterson, Lassen, 2; Hollow Hill Farm, 7; E. S. Tuck, Santa Rosa, 1; C. E. Barrows, Santa Rosa, 1; Clark Bros., Prosser, Wash., 2; D. C. Berman, Woodland, 10; H. J. Hammond, Sacramento, 6; G. M. York & Son, Modesto, 6; J. L. Thatcher, Riverside, 3; S. S. Day, Sacramento, 13; University Farm, Davis, 2; F. A. Brush, Santa Rosa, 14; Jas. Mills Orchard Corporation, Hamilton, 7; and Hopland Stock Farm, Hopland, 7.

Durocs.—J. P. Walker, Visalia, 10 head; J. P. Daggs, Modesto, 14; R. Q. Wickham, Glen Ellen, 5; W.

AGGIE GRACE PONTIAC CREAMELLE
Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Korndyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.9%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915.

My showing at the State Fair will include the Champion 2-year-old, her dam, her full sister, and a few choice young bulls for sale.

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

First Annual Sale, October 23rd and 24th

THOROUGHBREDS: A few mares and some two and three-year-olds, sired by the famous Derby Winner, **Rey El Santa Anita**, and the noted stallions, **Palo Alto** and **Jake Argent**, out of famous thoroughbred mares.

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion **Ibn Mahruss**, head of our Arabian Stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Fourteen of them, some of which are sired by **Ibn Mahruss**, world renowned imported desert saddle stallion, and **Don Costano**, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

POLAND CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland China herd boars—**Banker's Boy** and **Glenview Wonder**. And Berkshire Boars—**Kintyre Laird**, **Grandson's Duke** and **Fashion's Longfellow 5th**.

The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted **Prince Gelsche Walker**, and bulls from one World-Record cow and two California State-Record cows. Sixty females of the highest class will be consigned. Write for catalogue.

WORK HORSES AND MULES will also be offered for sale.

WRITE FOR PARTICULARS.

Fine Sows With Cheap Equipment.

[Written for Pacific Rural Press]

There are almost as many methods of swine raising as there are swine raisers in California; and to say that any one is perfect and the others imperfect would be untrue, for our variety of feeds and climate make any one of a number of systems profitable and practicable.

Under certain conditions capital invested in fine buildings and surroundings may be necessary and economical; but in the majority of cases the doctrine of the veteran hog raiser, M. Bassett of Kings county, is perfectly sound, in which he says, "A hog doesn't require a palace to grow in if he gets plenty of exercise and feed."

Except for a few farrowing pens near the barn for winter farrowing Mr. Bassett's entire equipment consists of temporary fencing, a few home-made feed-troughs and home-made shelters constructed of rough lumber and thatched straw or hay roofs.

It is under such conditions that one finds what is probably one of the most valuable herds of purebred Poland China swine in the West; and it is under such conditions also that Mr. Bassett runs his market hogs.

Brood Sows. — Primarily, the handling of the brood sows on this ranch are of interest to all hog raisers, whether breeders of purebred or market hogs; for success or failure with hogs is largely due to the success one has with his brood sows.

On the Bassett ranch the first step with the brood sows is in selecting them for individuality and prolificacy. Among the specifications of the young brood sow are, rather short but heavy boned legs, strong pasterns, good hams, well arched back, small head, deep body, and well sprung ribs.

Sows to become members of the reserve herd must be from prolific ancestors, not necessarily from sows with a habit of farrowing extraordinarily large litters, but who regularly farrow uniform litters in both size and quality. Mr. Bassett believes a sow that will raise seven or eight pigs of uniform size is the most desirable.

Exercise. — Being once selected, exercise is probably the next most important consideration. Mr. Bassett believes that the worst thing you can do with the brood sow is to shut her up in a small pen. As a result of this belief he not only gives

his sows ample room but goes even further and sees that they avail themselves of it to the greatest degree.

These pens are made with temporary fencing so that they may be moved at small expense and always they are located on alfalfa in such a manner that the sow has access to an irrigating ditch. This latter may be criticised as being dangerous; but without it Mr. Bassett says he would be lost.

Close to the ditch is located the cheaply constructed shelter above referred to, under which the sows spend most of their time in warm weather, bathing in the ditch principally in the early morning.

At the other end of the pens are located the feed troughs where soaked ground wheat and barley are fed in the summer and corn in the winter, the latter being too heating in the warm summer. Feeding is done principally in the early morning and late evening in order that the sows may do their walking from shelter to feed in the cool parts of the day. By having exceptionally long pens and feeding in this manner each sow is compelled to make several long trips a day and thus develop bone and vigor which has a telling effort upon the young pigs when born.

And by securing this needed exercise, it has been Mr. Bassett's experience that a sow which is naturally an easy feeder, will keep in heavy flesh without harmful results to the litter she is carrying.

In good weather, farrowing is done in these same pens but in wet weather more protection is afforded by a specially built farrowing house.

Mostly the young sows and frequently the bred sows are allowed the run of orchards or other fields where they pick up waste fruit, are few pumpkins, corn, alfalfa pasture, etc., but never do they know anything about expensive equipment or the extreme intensiveness so frequently seen elsewhere. Good common sense in hog raising is Mr. Bassett's favorite advice to inexperienced raisers, for that is what he practices himself.

Some wool is still being held in the San Joaquin valley by the growers, one large sheep man stating that he has two clips on hand which he will send to the National Warehouse company next month unless local buyers raise their prices.

INKA CANARY MERCEDES 2ND.
To Be Sold at Frank M. Helm's First Annual Holstein Auction Sale,
Fresno, Sept. 12.

Choice Holsteins

Consigned From

A. W. Morris & Sons' Herd COWS - HEIFERS - BULLS

In the California Holstein Breeders' Sale at Hanford, Cal., October 18th, and at the big Sacramento Sale, October 26th and 27th, under the auspices of the California Breeders' Sale and Pedigree Co., the quality of our consignments will be unsurpassed by any previous Pacific Coast Sale.

THERE WILL BE—

Choicely bred A. R. O. cows in calf to 30-pound sires.

Heifers out of A. R. O. cows and 30-pound sires and bred to 30-pound bulls.

Young bulls from 30-pound dams and with such yearly record backing as has never before been included in a California sale.

A son of Prince Gelsche Walker (the \$12,500 sire) from a 27-pound three-year-old that made 20 lbs. as a junior 2-year-old.

A son of King Mead of Riverside from a State record daughter of Prince Gelsche Walker.

A son of SEGIS PONTIAC DE KOL BURKE from Dottie Clyde Korn-dyke, 31.88 lbs., 113 lbs. milk in a day, a daughter of Korndyke Queen De Kol's Prince.

Two sons of Aralia De Kol Pontiac Segis out of 31 and 32-lb. daughters of De Kol Burke.

A son of a 33.50-lb. cow.

Two sons of 29-lb. cows.

A son of a 27.50-lb. daughter of Riverside Sadie De Kol Burke.

A son of a 27.58-lb. 4-year-old daughter of a 33-lb. cow.

Others from 25 to 30-pound dams, all with large yearly records.

The three nearest dams of a number of these have yearly records from 800 to 1100 lbs. butter, and along with this they have an abundance of individuality and breeding.

Further information on request.

Auctioneer.

VALUABLE COWS ARE MILKED The Hinman Way

Grosvenor & Finen, Lebanon, N. Y., say:

We have used your milking machine since March, 1911, and we are very much pleased with the results obtained by machine milking.

Our herd has 30 head of registered Holsteins, and we always milk all of them, all of the time with the Hinman Milker. We have never had any udder trouble caused by the machines; if we were to buy a milker today it would be the Hinman, as we know it is the best mechanical milker made.

Among other registered herds milked by the Hinman are:

Edw. G. Patterson, Bismark, N. Dak., Registered Jerseys.
Ex-Governor A. E. Lee, Vermillion, S. Dak., Reg. Holsteins.
McKay Bros., Waterloo, Iowa, (Tilly Alcartra came from this herd).

Kvendalen Farm, So. Wayne, Wis., Reg. Holsteins.

W. H. Sidney, Central Bridge, N. Y., Reg. Holsteins.

R. E. Farrand, Sumner, Iowa, Reg. Holsteins.

S. E. BORAH, Hinman Distributor for Wisconsin, says: "We have in the vicinity of Green County considerably over 500 units and practically no kickers."

The new Hinman Auto Milker is just out. Be sure to see it at the State Fair.

C. F. Daniells & Son

2511 Prince St.,
Berkeley, Cal.

Just a Tilt of the Pail

Women don't mind filling the knee-high supply can of the new Suction-feed. Only a few inches to lift. No straining of back or arms.

THE NEW SHARPLES SUCTION-FEED

Separator gets all the cream all the time. Any other separator will lose cream when the speed slackens. You can't always turn at exactly the right speed. No one can. It's impossible. The Suction-feed skims clean, fast or slow, and delivers even cream. Capacity increases with the speed. Come in and let us show you how it works.

See these Separators on exhibit at the State Fair.

BALDWIN RANCH STOCK SALE.

[Written for Pacific Rural Press]

Breeders of purebred livestock will be more than ordinarily interested in the announcement that the Santa Anita Rancho, owned by Mrs. Anita M. Baldwin, is to hold its first annual sale of purebred livestock on the home grounds October 23 and 24 including registered Holstein cattle, thoroughbred and Arabian horses, and Berkshire and Poland China swine.

Included in the Holsteins, according to Superintendent W. H. Taylor, will be a son of Alba Sadie who made a record early this year of 34.16 pounds of butter in seven days; a son of Miss Valley Mead De Kol Walker; a son of Prince Gelsche Walker out of a 23-pound three-year-old; and a son of the world's official record cow for six months, Mosetta Mutual Paul Johanna, whose six-month record was 16,842.2 pounds of milk and 706.267 pounds butter. This wonderful cow is still on test and is expected to break the yearly record for this class.

Altogether there will be 15 bulls offered; and except one or two head, all will be out of A. R. O. dams.

The hog offering will be equally high in quality as the Holsteins, the 25 head to be sold being sired by such boars as Bankers Boy, Kintyre Laird, and Longfellow Duke and out of champion and prize-winning sows at the P. P. I. E.

To lovers of good horses the sale will offer special inducements, as there will be two mares and three geldings sired by the derby winner Rey El Santa Anita. Besides these there will be a number of Mrs. Baldwin's fancy gaited saddlers sired by such outstanding stallions as Ibu Makruss and Don Castana. Most of these latter will be two and three years old and fully in keeping with the high quality horses for which Santa Anita Rancho is noted.

The greatest crowd of livestock breeders ever assembled at a public sale in the West is expected to be present when Col. Ben Rhoades begins calling for bids, as breeders from far and near will doubtless avail themselves of this opportunity to accept the hospitality of one of the West's greatest breeding establishments.

STOCK TESTED BEFORE SALE.

The best way to keep the purebred business in California on a paying basis is to play the game "square" and earnestly endeavor to give the buyer every protection possible. The various registry Associations guarantee the purity of blood in the animals registered in their books, but aside from this the California buyers have never received as strong a guarantee as to the health of the animal they purchase as is being given by Mr. Frank M. Helm at his sale at Fresno on Sept. 12th.

Mr. Helm has arranged with Dr. Chas. Keane, State Vet., to test his cattle going into the sale and to also make a rigid physical examination of each individual. This is the first sale ever held in California where the Live Stock Sanitary Department has taken full charge and will issue individual certificates showing the animal to be right.

Recording Hog Weights, Gains, Feeds.

[Written for Pacific Rural Press]

There is only one way of knowing whether you are putting economical gains on your hogs and that is by weighing the feed and hogs at regular intervals.

Usually this is not done because of the supposed trouble it requires to weigh each feeding and keep track of it for a number of pens.

On the Peters, Lamson, and Walker ranch at Devore, San Bernardino county, a simple system of hog book-keeping has been worked out by the introduction of daily feeding sheets, like the one shown below:

Date	Feeds	Pen Number		Pen Number		Pen Number	
		A. M.	P. M.	A. M.	P. M.	A. M.	P. M.
Jan. 1, 1916	Barley						
	Brans						
	Tankage						
	Oil meal						
	Middlings						

Instead of ruling off just one day's record as is shown above, several days are included on each sheet of paper and these sheets are tacked to the wall close to the feed-mixing floor.

Measures are used, the capacity of each in pounds being already ascertained, which data is also posted on the wall. When feeding is done, the amount of each feed contained in the ration is measured out for each pen and the various amounts of the respective feeds are placed opposite their names on the feed rec-

ord under the pen number for which it is to be used. If the amount is fed in the morning it is put under "A. M." and if at night under "P. M."

After one familiarizes himself with the measures it takes but an instant to mark down the amount of each feed used for each pen. The amounts shown in one day serve to guide the feeder as to the amount each pen should have the next.

From these record sheets the data are transferred to a book which shows the age, weight, gain previous two weeks, gain last two weeks, gain

per pound of grain, gain per day, cost per pound of gain, per cent of each feed per hundred pounds live weight.

Every two weeks the hogs are weighed; and by reference to the data contained in the record book, it is easy to determine the cost of gain and the efficiency of each feed used.

By recording the age of stock in each pen, the kinds and amounts of feed most economical for different aged animals may be determined with little extra work.

COW TESTING RESULTS.

Kern county's Farm Bureau's first month of cow testing included 1011 cows. The following produced over 40 pounds fat:

(Initials indicate the breed.)

Will be at the Live Stock Shows With

Jersey Cattle

and O. I. C. Swine

With our herd will be a number of young Jersey bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

Meet Me at the Fair

and inspect I. B. A. WONDER, No. 218975, and about thirty head of his get, which will be for sale after the show. At Napa his pigs won first, weighing 330 lbs. at 213 days from birth, grown by a novice. What breed of hogs can beat it?

I. B. A. WONDER weighs almost 1000 lbs. in breeding condition and is as smooth as a pig.

W. A. YOUNG
LODI, CALIFORNIA

Breeders of Registered Poland-Chinas.

There is a great interest at this time among swine breeders regarding sales and exhibits at the various fairs. Now is just the time when you need a copy of the "California Hog Book," which covers the swine industry from every standpoint. Price \$2 postpaid.

STATE POLAND CHINA ASSOCIA-TION PROPOSED.

Hurrah for the Poland China peo-ple! O. L. Linn of the Modesto Poland China Breeders' Ass'n writes that the Kings County breeders ex-pect to co-operate in the Sale of the former to be held Sept. 20 during the Stanislaus Livestock Exposition Sept. 18-22. They will probably hold a get-together meeting and ban-quet at which will be discussed the idea of forming a State-wide fed-eration of all the local associations now existing. This is a suggestion proposed and favored by Pacific Rural Press and we will be glad to note its unbounded success.

The first co-operative sale of all kinds of stock ever held in Cali-fornia, will be carried out by the local Farmers' Union on the same day as the Poland China sale, but with no public outcry.

Gombault's Caustic Balsam

The Worlds Greatest and Surest

Truckee Valley Model Dairy.

[Written for Pacific Rural Press by Bert S. Wolf.]

The largest dairy in Truckee Valley is also known as The Model Dairy. It is owned by C. W. Brooks of Reno, who has about 100 cows, mostly Holsteins. Eventually all his stock will be Guernsey and Holstein.

Cleanliness of barns and corrals, washing of the cows, special white suits for the milkers, etc., enable Mr. Brooks to put out a milk of low bacterial count claimed up to certified milk standards, though there is no such thing yet as certifying milk in Nevada.

Cleanliness is made easy by the automatic pumping engine which gives 60 pounds water pressure through a 1000-gallon tank. This water exclusively is used for drinking, also to cool the milk quickly to 52 degrees, and to flush out the barn after every milking.

Sheds with concrete foundation posts all over the ranch protect the cows from stormy weather.

Plenty of alfalfa is grown on the place and stacked for winter use with 1½ tons of salt to 400 tons of hay.

Mr. Brooks is about to visit the

large dairies of California to pick up pointers for still further improvement.

MOVABLE DAIRY COW STANCHIONS.

[Written for Pacific Rural Press.]

In building dairy barns it is always difficult to arrive at the proper distance that should separate the stanchion and the gutter, because of the great variations in the length of different cows.

R. F. Fischer of Carlotta, Humboldt county, has overcome this trouble in his dairy barn by making movable stanchions. This is accomplished by building three stanchions into each section and having each section movable backward or forward, according to the length of the cows, the stanchions being supported at the end by four-by-four roof supports.

To further facilitate the work of fitting the floor space to the cows, it is the practice to select those of nearly equal size for each section of stanchions, the older cows usually being grouped together as are the heifers by themselves.

RAISING CALVES.

[Written for Pacific Rural Press.]

Calf-raising is more trouble than it should be on many dairies and most of it is due to the method of feeding. Such is the belief of A. J. Hesse of Merced county, who never has any trouble in this respect.

For the first three milkings the calves on this ranch are allowed to suckle their mothers. Then they are started on whole milk fed in buckets, but care is always taken that they are good and hungry before this is begun.

At first they are induced to drink by letting them suck the feeder's fingers; but in three days they are willing to drink out of the bucket without coaxing. The ration of milk is always weighed out to them and care exercised in not giving too much as that would cause scouring.

At seven days their horns are treated with caustic, this having been found the most satisfactory time for dehorning by Mr. Hesse.

SELL DILUTED MANURE.

[Written for Pacific Rural Press.]

Citrus growers and others who customarily buy manure for fertilizer in the large cities would do well to look into the source of supply, according to one of our subscribers in Los Angeles county, past whose place of business a large amount of manure is hauled daily.

According to this friend, it is the practice of these city manure collectors to load their wagon with manure and then soak it heavily with water, to increase the load.

Another practice of these collectors is to mix sand with the manure after collecting it. In this case the wagonful of manure is driven to a large pile of sand and unloaded. Reloading is then started, one man staying on the wagon to mix the sand and manure while the other one throws on some manure, then some sand, etc. When mixed the sand is difficult to detect,

Western American Berkshire Congress

MEETING
Sept. 4

SHOW
Sept. 5 and 6

SALE
Sept. 7

AT STATE FAIR GROUNDS, SACRAMENTO.

BERKSHIRE WEEK ON THE COAST

THE CONGRESS MEETING should draw every Berkshire man on the Pacific Slope. A strong program has been prepared and the discussions will be led by men prominent in Berkshire circles—men who have something to say and know how to say it.

THE CONGRESS SHOW will be the greatest exhibit of Berkshires ever held on the Coast. It will be a wonderful show of Berkshire breeding stock of the highest type and quality.

THE CONGRESS SALE will be an offering of choice selected Berkshire breeding animals. Only good ones, and from the best and most popular blood lines. Consignments to the Sale are from some of the most prominent Berkshire Breeders in the West—A. B. Humphrey, Jos. Wilson, Clark Bros., F. L. Hall, C. M. Talmadge, F. R. Steel, J. L. Thatcher, Hollow Hill Farm, Fontana Land Co., G. A. Murphy, H. L. Murphy, Oak Grove Dairy Farm, and others.

This is an opportunity to get the best for your foundation herd.

Remember the dates, and be there.

Making Cheddar Cheese in Valley Heat.

[Written for Pacific Rural Press.]

What looks to be the beginning of successful cheese manufacture with milk from alfalfa-fed cows is the experience of the Caruthers Cheese Factory in Fresno county during the past two years. About 12,000 pounds of milk is being received at this factory daily, though this amount is increased during the fall and winter months when most of the cows freshen, and when it is easier to deliver milk in a sweet condition.

A good quality of cheddar cheese is being turned out at this plant for which a satisfactory market has been found. While it is doubtful whether the product could go onto the Eastern markets in competition with Eastern made cheese, it is a big improvement over past attempts at cheese making in the interior val-

leys; and there is every reason to expect improvement in the future.

That such factories afford a good market for the dairyman is indicated by the large quantity of sweet milk being received at the most trying time of the year for interior valley dairymen. This is directly attributable to the fact that while the price to the producer is based on the cheese quotations, it is always four to six cents above the San Francisco butter quotation. This premium seems large enough to warrant the additional care necessary for delivery of sweet milk to the factory. These prices are based on four per cent milk. A delivery charge of 10 cents a hundred is deducted where the farmer does not deliver his own milk.

STARTLED BY SCALES AND TESTER.

[Written for Pacific Rural Press.]

As a suggestion of how small a percentage of the dairy cows in the State are capable of producing at least 300 pounds of butterfat in a year, we present the experience of Charles Olsen of Atwater.

Mr. Olsen is an experienced creamery man; and when he purchased his present ranch of 68 acres he decided to select his milking herd by the tester and scales. During the past three years he has purchased at different times 30 grade cows; and of that number just six have been reserved, none of the others being able to make the 300 pounds of fat a year that Mr. Olsen insists on.

The fallacy of trying to determine the worth of a cow for butterfat production without use of scales and tester is shown by a cow that Mr. Olsen tested on his own ranch.

He weighed and tested her milk and found that she was giving better than a pound and three-quarters of fat a day. Furthermore, she proved persistent and is now considered one of the best cows in the herd.

Another advantage of weighing and testing the milk has been found in the prices offered for Mr. Olsen's cattle, one man offering him \$150 apiece for four head when the ruling price was between \$80 and \$90.

TWO SOWS YIELD \$800.

[Written for Pacific Rural Press.]

While hog raising is not the get-rich-quick industry that some would have us believe, surprising results are often secured with one or two

good young sows as a foundation.

It was from such a start that H. Ward of Chowchilla, Madera county, has been able to sell over \$800 worth of breeding and butcher hogs during the past two years.

Needless to say Mr. Ward's two foundation sows were purebreds, both being Durocs. Mostly, they as well as their offspring have been grown on alfalfa; with a moderate amount of barley all the time, for it has been his experience that to be successful with hogs a small amount of grain in the ration all of the time is desirable.

At the time of our visit, this grain was being furnished by the rakings from a grain field that had already been harvested. Pasturing the stubble would have been better, but the field was not fenced, so the other method was substituted. Some tankage was fed last winter with good results.

EARLY WINTER PASTURE.

[Written for Pacific Rural Press.]

Rape planted between the rows of sorghum corn early in September on Hawley Bros.' ranch in Madera county did not amount to much because it was not irrigated and the rains were late. It came up and lived through, but made very little growth.

But one section of corn, not planted to rape, which was cleared off in the fall and irrigated, was planted to rye and vetch for winter pasture about Oct. 1. This made good pasture in late November, though other pieces planted a little later did not make good.

A Daughter of the King of the Pontiacs, Consigned by McAlister & Sons to the Rio Vista Holstein Farm Dispersion Sale, Rivera, Sept. 19 and 20.

REMCO Air-Dried Redwood

PIPE

For Irrigation—Water Supply—Power. Sizes 2 inches to 12 feet. For pressures up to 400 feet head. Guaranteed for 100 per cent overload.

Costs less than any other pipe of equal capacity, efficiency and endurance.

Not affected by worms or insects, acid or alkaline soils, electrolysis or roots.

Withstands extremes of heat and cold, dryness and moisture.

Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

Stanislaus County Duroc-Jersey Swine Breeders' Ass'n, Modesto, between Sept. 18 and 23. (Forty head selected from local herds to give buyers and visitors a good impression.)

Western American Berkshire Congress, Sacramento, Sept. 7. (Consignments from A. B. Humphrey, F. L. Hall, J. L. Thatcher, C. M. Tamadge, F. R. Steel, Murphy Bros., Clark Bros., and other well known breeders.)

Cal. Holstein Breeders' Ass'n, Hanford, Oct. 18 (100 registered Holsteins, many with A. R. O. records, 20 to 26 pounds. All consigned by leading breeders of the State, including A. W. Morris and Sons of Woodland.)

McAlister and Rhoades, Rivera, Holsteins, Sept. 19-20 (heifers from King of the Pontiacs, King Hengerveld, Spring Farm Pontiac Tidy Abbekirk Prince, etc., out of high record dams and bred to well-known bulls. Every animal tuberculin tested).

DAIRYING AND DAIRYMEN.

Good grade dairy cows are reported to be selling for \$100 to \$125 apiece in the dairy districts tributary to Los Angeles.

Jewel of Venadera, owned by Guy Miller of Modesto, has recently finished a record as a 3-year-old of 609.9 pounds fat from 10,262 pounds milk.

There is a growing conviction among dairymen of southern California that it is cheaper to buy alfalfa hay and plant the land to Indian corn after a crop of grain hay has been previously harvested.

Two brick silos are being erected on the Rio Vista Ranch owned by Col. Ben. Rhoades of Rivera. It is thought they will be equally efficient as concrete silos and about half as expensive to build.

The Fontana Land Company now have close to 5,000 hogs on their properties near Fontana, San Bernardino county. A considerable number of these are purebred Berkshires, Poland Chinas, and Durocs.

The feeding of fresh beet pulp to beef cattle has been entirely done away with at Oxnard, all of the pulp

now being dried and sold in that form. The American Beet Sugar Co. is turning out 3600 sacks of the dried pulp a day for distribution all over the United States.

The Sam Davis herd of Holsteins was imported to Nevada State from Germany 25 years ago by Sam Davis and the Migules Bros. of Carson. This was the first Holstein herd in Nevada and H. A. Migules still has a cow from the original foundation.

Frampton Bros. of Artesia state that their two concrete silos paid for themselves the first year they were in use, the agreement with the builders being that whatever saving was made each month in mill feed would be applied to the construction costs.

The milk producers of southern California, through their co-operative marketing association, are not only getting an increased price for their product, but are saving their members a great many thousand dollars by co-operative purchasing of feed in large quantities, direct from the producer.

SWINE BREEDERS AND STOCK.

New hog quarters are contemplated on the farm of the Whittier State school, in order that a large number of purebred Berkshire brood sows may be maintained.

Hayden Smith of Woodland reports July Duroc sales as follows: Boar to Richter and Clover, Woodland; boar and gilt to Chas. Schnepfe, Dunnigan; boar and gilt to W. L. Haley, Lassen county; boar and three gilts to G. L. Horine, Merced county; five bred gilts to G. R. Oliver, Solano county; boar to A. H. Coates, San Francisco.

River Bend Farm, St. Helena, has just received a 600-pound daughter of the Duroc International grand champion, "Defender." This sow was purchased in Kentucky and is bred for early farrowing to "Orion's Pal." The Farm will exhibit its herd boar "River Bend High Model," a sow—"River Bend Lass"—bred to him, and eight four-months pigs which top the scales at over 100 pounds.

Secretary Elmer Lamb writes that the Duroc-Jersey Swine Breeders' Association of Stanislaus county has completed arrangements for the consignment sale to be held at the Stanislaus County Live Stock Show and Exposition. T. J. Gilkerson will cry the sale Sept. 22 at 1 p. m., assisted in the ring by O. S. Gilbert. Prof. J. I. Thompson of University Farm will visit the herds of the consignors this week and select the hogs to be consigned. Catalogs will be ready for mailing about Aug. 27.

SHEEP, CATTLE, GENERAL.

Idaho sheepmen have been looking for winter sheep pasture in Imperial Valley.

Solano County Fair had been having fine attendance up to our latest reports before going to press.

From all present indications there will be a better sheep show at Sacramento this fall than for some time past, both in the wool and mutton breeds.

BILLIKEN HERD OF IMPROVED

Chester Whites

(The Farmer's Utility Breed)

STAR VENO,
1st Prize Aged Sow and Grand Champion at 1914 State Fair.

The easy feeding type that make rapid and economical gains. Size and quality combined, of quiet disposition and producing large uniform litters. This is the breed that pays big interest on the investment. The individuals of this herd represent the best and most popular blood lines of the breed. Every animal is immune to hog cholera, the virus-serum treatment being used. Prices are reasonable and quality is first-class. See them at the State Fair.

BLACKHAWK BARN KING.

BLACKHAWK STOCK RANCH

BURLINGAME, CAL.

EXHIBITORS' NOTES.

Hayden Smith of Woodland will show four Durocs.

T. B. Purvine of Petaluma will show two full Jersey herds.

The River Bend Farm of St. Helena will show 10 Durocs.

J. E. Thorp of Stockton will show his Duroc sire Omar of Mossdale.

A. M. Henry of Farmington has a Poland China herd in the futurity.

C. B. Cunningham of Mills will have 26 O. I. C. hogs at the State Fair.

Bullard Bros. of Woodland will show 21 Rambouillets and 36 range sheep.

F. Stenzel of San Lorenzo has entered two cows in the five-day milking contest.

The N. H. Locke Co. will have 14 O. I. C. swine and 23 Jersey cattle at the State Fair.

It is reported that Golden Lassie, Duroc sow which raised 14 pigs farrowed in March, will be on exhibit.

Watch for the groups of livestock showing two or more generations. There you have the proof of the pudding.

M. Bassett of Hanford will show the Percheron stallion Ithos, and three of his get. Ithos was a P. P. I. E. winner.

The Whitehall Estates will show 27 Percherons, including Londrocitos, second prize winner aged stallion, P. P. I. E.

M. Bassett of Hanford, who showed the grand champion Poland China sow at P. P. I. E., will have 24 head at the State Fair.

F. A. Brush of Santa Rosa will show the P. P. I. E. grand champion Berkshire sow Riverby Princess, and two of her litter mates.

The J. W. Mills Orchard Co. will show their \$400 Berkshire sow Foxgrove Laurel 8th, the best of those bought at the Carruthers sale.

J. W. Henderson of Berkeley, who won grand champion Hampshire boar and sow at P. P. I. E., will have 18 head at Sacramento.

Riverina Farms have entered twenty-six large Yorkshires for the State Fair. This is the herd that was shown at the Panama-Pacific.

Bishop Bros. of San Ramon, who won a large number of the P. P. I. E. Shropshire prizes, will show 36 Shropshires and 21 range sheep.

Walter Dupee of Santee will show his P. P. I. E. grand champion herd bull Imp Itchen May King, and also Itchen Wood Sorrel, grand champion cow.

Kaupke Bros. of Woodland, who not long ago purchased the Royal Show winning Hampshire ram, will show 15 of that breed at Sacramento.

W. A. Young of Lodi, whose Poland China boar I B A Wonder won reserve championship at P. P. I. E., will show 29 head at Sacramento.

A. B. Humphrey of Escalon will show the get of Grand Leader 2nd, P. P. I. E. grand champion Berkshire, and some from Fashion Longellow 5th.

A. W. Foster of Hopland Stock Farm is showing a larger herd of

Shorthorns at the State Fair than he did at P. P. I. E. where his bull won grand championship.

Ruby & Bowers of Davis will show Percherons, Belgians, and Clydesdales, including first prize yearling Belgian Stevenot of P. P. I. E., his mother, and her yearling son.

A. B. Humphrey of Escalon, who won grand championship on his Berkshire Grand Leader 2nd at P. P. I. E., will show about 30 head at the State Fair, and a dozen Guernsey cattle.

Black Hawk Stock Farms horse barn is more attractively decorated than at P. P. I. E., rye straw mats copied after the Royal stables of London being used with lots of colored bunting.

A. W. Morris & Sons will show the four-year bull Segis Pontiac De Kol Burke; King Korndyke Pontiac; Aralia De Kol Pontiac Segis; and Aralia De Kol Alcartra, among the 40 head entered.

H. C. Lookabaugh, a Shorthorn breeder of Oklahoma, who showed at P. P. I. E., has written the State Fair management trying to get railway rates so he can show at our western fairs. Present tariffs for California apply only to contiguous States.

Elmer Lamb of Ceres will have 18 Durocs at the State Fair. Mr. Lamb has some "American Beauties." At P. P. I. E. he showed the junior and reserve grand champion sow, champion sow bred by exhibitor, and several other prizes.

Very little of Southern California's purebred livestock will be shown at the coming State Fair, due largely to the distance the stock would have to be shipped. An exception will be Geo. W. Wilder of Redlands, who will show several fine Berkshire hogs.

The A. L. Tubbs Co. of Calistoga writes: "We are taking ten large Yorkshires to the State Fair, two herd boars, two junior yearling sows, and six spring pigs. We realize that an advertisement in your paper is the best means of drawing attention to them."

The Oak Grove Dairy Farm of Woodland, whose Berkshire herd sire, Artful Masterpiece, was grand champion at Oklahoma State Fair 1908, and grand champion at California State Fairs of 1912 and 1913, will have eight head at the 1916 State Fair. Artful Masterpiece died last week. Their herd sire, Improver B, and some of his pigs will be at the State Fair.

The Black Hawk Stock Farms of Burlingame will show 25 Shires, every one of which won a ribbon at P. P. I. E. They will include the 1st prize stallion foal Salvador Conqueror, one of five which the Black Hawk people have bought from Henry Wheatley of Napa. They will also include Anwick Arthur, which won 1st with three of his colts; Horton Bounce, reserve grand champion mare P. P. I. E., and Black Hawk Beauty, reserve junior champion.

The El Mirador (Tulare county) Packing House Co. has recently incorporated to put up a plant.

Auction Sale!

AT

Modesto, Cal., September 28, 1916

Hauck's Poland-Chinas

CANTRALL'S IDEAL, son of BIG JOE, was selected for me in Iowa by Geo. M. Cantrell. He now weighs, at 18 months, over 600 lbs. in breeding condition, stands 36 inches high, 70 inches long, head girth 72 1/2 inches, flank girth 73 inches. Size of bone 10 inches. Has broad deep hams and an ideal head. Have a few late Spring pigs by him, and they all look like their dad. Have a few March boar pigs by LONG MODEL that are good big fellows—they are out of extra good big-type sows.

WILL SHOW A FEW PIGS AT THE STATE FAIR.

NATE HAUCK,

Alton, Humboldt Co., Cal.

Breeder of Big-Type Poland-Chinas.

BIG TYPE POLAND CHINAS

Glits from Weanlings to one year old. Bred or open. Boars from weanlings to 8 months.

THE BROWNING STOCK FARM

W. H. BROWNING, PROP.

WOODLAND, CAL.

SIX DECADES OF CALIFORNIA FAIRS.

(Continued from page 204.)

declaring the society a state institution and empowering the governor to appoint twelve citizens of the state to comprise such a board. This was done, but it produced no great change in the race track gambling at the fairs because the governor appointed practically the same people who had previously been elected and the old game went on. At the fair of 1881, Hon. John Bidwell in his annual address spoke very plainly on this subject:

I submit to the good sense and moral convictions of the people of this state that horse racing is not an innocent recreation unless gambling is innocent. At these races they sell pools and bet money. This is the programme: the daily, unblushing practice. This society and cognate district societies are wholly under state control; therefore the state, in this matter, maintains gambling institutions under the guise of fairs. If it is right to have a speed programme, then give it a purse, or purses, from the public money. No one, I believe, has ever yet been bold enough to ask that of this state, yet inadvertently the public money has been used for that very purpose.

But in spite of such protest the gambling continued for a quarter of a century, until the state legislature, being no longer able to overlook its demoralizing effect upon the community, proscribed race track gambling within the state. And the experience since that proscription has shown very clearly that instead of gambling being a pillar of the fair, that institution has builded higher and more broadly on the solid ground of honest effort and of decency than ever it could upon any other kind of support.
